

DWBB Application Specific – Data Integrity

The Data Integrity Building Block IP consist of three components targeted for high reliability applications. These components include Error Checking and Correction (ECC), a 32-bit Cyclic Redundancy Check (CRC) generator/checker, and a parity checker.

The 32-bit CRC polynomial generator/checker provides data integrity on data streams of varying length in network applications. The ECC component implements single-error correction, double-error detection (SEDED) error correcting code over a parameterized range of word widths. The parity checker can be used with peripherals such as disk drives, and with external DRAM or SRAM buffers.
