

DW_ram_r_w_a_lat

Asynchronous Dual-Port RAM (Latch-Based)

Version, STAR, and myDesignWare Subscriptions: [IP Directory](#)

Features and Benefits

- Parameterized word depth
- Parameterized data width
- Asynchronous static memory
- Parameterized reset implementation

Revision History

Description

DW_ram_r_w_a_lat implements a parameterized, asynchronous, dual-port static RAM.

Table 1-1 Pin Description

Pin Name	Width	Direction	Function
rst_n	1 bit	Input	Reset, active low
cs_n	1 bit	Input	Chip select, active low
wr_n	1 bit	Input	Write enable, active low
rd_addr	$\text{ceil}(\log_2[\text{depth}])$ bits	Input	Read address bus
wr_addr	$\text{ceil}(\log_2[\text{depth}])$ bits	Input	Write address bus
data_in	<i>data_width</i> bits	Input	Input data bus
data_out	<i>data_width</i> bits	Output	Output data bus

Table 1-2 Parameter Description

Parameter	Values	Description
data_width	1 to 256 Default: None	Width of data_in and data_out buses
depth	2 to 256 Default: None	Number of words in the memory array (address width)
rst_mode	0 or 1 Default: 1	Determines if the rst_n input is used. <ul style="list-style-type: none">■ 0 = rst_n initializes the RAM■ 1 = rst_n is not connected

Table 1-3 Synthesis Implementations

Implementation Name	Function	License Feature Required
str	Synthesis model	DesignWare

Table 1-4 Simulation Models

Model	Function
DW06.DW_RAM_R_W_A_LAT_CFG_SIM	VHDL simulation configuration
dw/dw06/src/DW_ram_r_w_a_lat_sim.vhd	VHDL simulation model source code
dw/sim_ver/DW_ram_r_w_a_lat.v	Verilog simulation model source code

The write data enters the RAM through the `data_in` input port and is read out at the `data_out` port. The RAM is constantly reading regardless of the state of `cs_n`.

The `rd_addr` and `wr_addr` ports are used to address the *depth* words in memory. For read addresses beyond the maximum depth (for example, `rd_addr` = 7 and *depth* = 6), the `data_out` bus is driven low. For `wr_addr` beyond the maximum depth, nothing occurs and the data is lost. No warnings are given during simulations when an address beyond the scope of *depth* is used.

Attention

This component contains enable signals for internal latches that are derived from the `wr_n` port. To keep hold times to a minimum, you should consider instances of this component to be individual floorplanning elements.

Chip Selection, Reading and Writing

The `cs_n` input is the chip select, active low signal, which enables data to be written to the RAM. The RAM is constantly reading, regardless of the state of `cs_n`.

When `cs_n` and `wr_n` (write enable, active low) are both low, the `data_in` is transparent to the internal memory cell being accessed (`data_in` = `data_out`). Therefore, during the period when `wr_n` and `cs_n` are low, a change in data in is reflected on the output of the internal memory cell being accessed.

If `rd_addr` and `wr_addr` are the same value and `wr_n` is low, data passes through the RAM (`data_in` = `data_out`). Data is captured into the memory cell on the low-to-high transition of `wr_n`.

When `cs_n` is high, writing to the RAM is disabled.

Reset

rst_n
This signal is an active-low input that initializes the RAM to zeros if the `rst_mode` parameter is set to 0, independent of the value of `cs_n`. If the `rst_mode` parameter is set to 1, `rst_n` does not affect the RAM and should be tied high or low. Synthesis optimizes the design, and does not use the `rst_n` signal.

 **Attention**

If the technology library being used does not contain an active low D-latch with clear, synthesis gates the inputs of a D-latch with the `rst_n` signal, increasing the area of the design.

Application Notes

DW_ram_r_w_a_lat is intended to be used as a small scratch-pad memory or register file. Because DW_ram_r_w_a_lat is built from the cells within the ASIC cell library, it should be kept small to obtain an efficient implementation. If a larger memory is required, you should consider using a hard macro RAM from the ASIC library in use.

Timing Waveforms

The figures in this section show timing diagrams for various conditions of DW_ram_r_w_a_lat

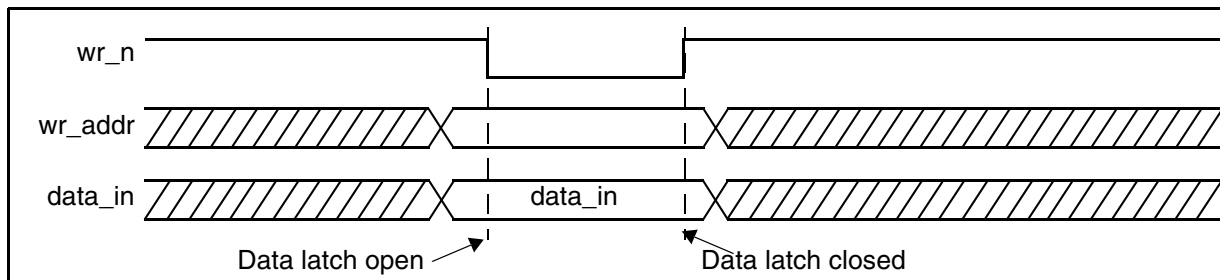

Figure 1-1 RAM Reset Timing Waveforms.

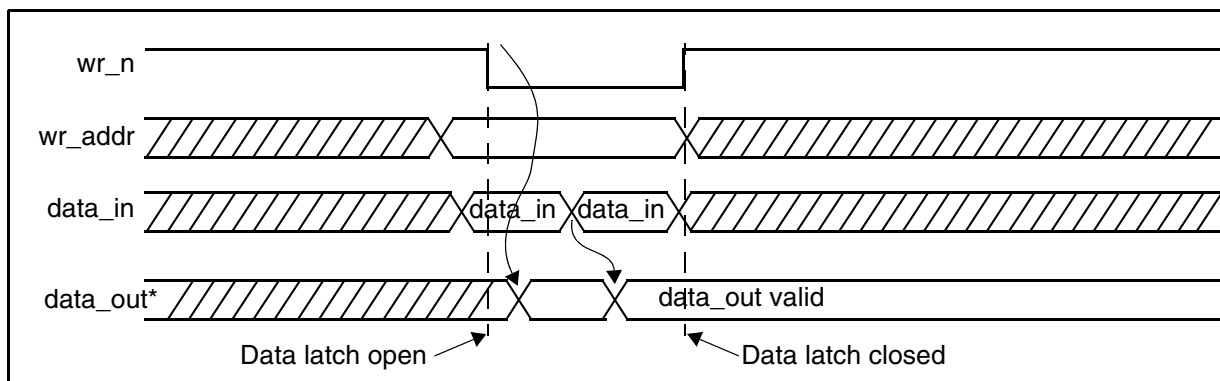

¹ Internal RAM Data is the array of memory bits; the memory is not available to users.

Figure 1-2 Instantiated RAM Timing Waveforms

Write Timing, cs_n = 0, Normal Data Input and Output

Write Timing, cs_n = 0, Changing Data Input and Output

* Write through is seen only when rd_addr = wr_addr.

Read Timing, address controlled, cs_n = don't care
