Registered Trademarks (®)

Synopsys, AMPS, Astro, Behavior Extracting Synthesis Technology, Cadabra, CATS, Certify, CHIPit, Design Compiler, DesignWare, Formality, HDL Analyst, HSIM, HSPICE, Identify, iN-Phase, Leda, MAST, ModelTools, NanoSim, OpenVera, PathMill, Physical Compiler, PrimeTime, SCOPE, Simply Better Results, SiVL, SNUG, SolvNet, Syndicated, Synplicity, Synplify, Synplify Pro, Synthesis Constraints Optimization Environment, TetraMAX, the Synplicity logo, UMRBus, VCS, Vera, and YIELDirector are registered trademarks of Synopsys, Inc.

Trademarks (™)

AFGen, Apollo, Astro-Rail, Astro-Xtalk, Aurora, AvanWaves, BEST, Columbia, Columbia-CE, Confirma, Cosmos, CosmosLE, CosmosScope, CRITIC, CustomSim, DC Expert, DC Professional, DC Ultra, Design Analyzer, Design Vision, DesignerHDL, DesignPower, DFTMAX, Direct Silicon Access, Discovery, Eclypse, Encore, EPIC, Galaxy, Galaxy Custom Designer, HANEX, HAPS, HapsTrak, HDL Compiler, Hercules, Hierarchical Optimization Technology, High-performance plus ASIC Prototyping System, HSIM, i-Virtual Stepper, IIICE, in-Sync, iN-Tandem, Jupiter, Jupiter-DP, JupiterXT, JupiterXT-ASIC, Liberty, Libra-Passport, Library Compiler, Magellan, Mars, Mars-Rail, Mars-Xtalk, Milkyway, ModelSource, Module Compiler, MultiPoint, Physical Analyst, Planet, Planet-PL, Polaris, Power Compiler, Raphael, Saturn, Scirocco, Scirocco-i, Star-RCXT, Star-SimXT, System Compiler, System Designer, Taurus, TotalRecall, TSUPREM-4, VCS Express, VCSI, VHDL Compiler, VirSim, and VMC are trademarks of Synopsys, Inc.

Service Marks (SM)

MAP-in, SVP Café, and TAP-in are service marks of Synopsys, Inc.

SystemC is a trademark of the Open SystemC Initiative and is used under license.

ARM and AMBA are registered trademarks of ARM Limited.

Saber is a registered trademark of SabreMark Limited Partnership and is used under license.

All other product or company names may be trademarks of their respective owners.

add_clock_drivers

Adds multiple levels of drivers into your design and connects them together. These drivers are suitable for driving a clock mesh.

SYNTAX

```
status add_clock_drivers
    -load net_or_pins -prefix prefix_string
        | -remove_display
    [-configuration list_of_groups
        | -external_configuration config_file]
    [-driver_type library_cell]
    [-avoid cells]
    [-max_displacement {x_distance y_distance}]
    [-offset {x_distance y_distance}]
    [-use_common_bbox]
    [-check_only]
    [-verbose]
```

<i>library_cell</i>	string
<i>cells</i>	collection
<i>x_distance</i>	float
<i>y_distance</i>	float

ARGUMENTS

```
-load net_or_pins
    Specifies the overall driver pin and the set of overall load pins. When you
    specify a net, it must have one driver pin and typically has many input (load)
    pins.
    If you only want to work on a subset of the pins of a net, use the driving
    pin of the net and the pins that you want to process as the value of this
    option.
    This option and the -remove_display option are mutually exclusive. You must
    specify one of them.

-prefix prefix_string
    Specifies the prefix for all newly created nets and cells. All newly created
    nets and cells also have a suffix that denotes their level and unique ID. You
    should not use this prefix for any other nets or cells in the design. This
    is a global option: it impacts all created drivers.
    There is no default prefix. If you specify the -load option, you must also
    specify this option.

-remove_display
    Removes the previously annotated tentative mesh drivers from the GUI. This
```

option works only when the GUI is open.

-configuration *list_of_groups*

Defines groups of drivers to be added.

This option accepts a list of any length. Each element in the list defines a group of drivers to be added, and each element must itself be a Tcl list. For details about the configuration syntax, see the CONFIGURATION STRUCTURE section below.

This option and the **-external_configuration** option are mutually exclusive; you can specify only one.

-external_configuration *config_file*

Specifies the configuration in a Tcl text file.

Each line of text in the file is considered a Tcl command, and must begin with the **add_clock_driver_group** command name. The syntax and semantics of this file is identical to the **-configuration** option. For details about the configuration syntax, see the CONFIGURATION STRUCTURE section below.

(Note that the command `add_clock_drivers_group` is not available unless processed through the **-external_configuration** option.)

This option and the **-configuration** option are mutually exclusive; you can specify only one.

-driver_type *library_cell*

Specifies the default driver cell to use. The specified driver cell must have exactly one input and one output.

The configuration can override the default driver cell for a specific group of drivers. If you do not specify this option, each group in the configuration must explicitly specify a driver type.

-avoid *cells*

Prevents drivers from being inserted at the top of a large macro block. You can specify any number of cells as a list or a collection.

-max_displacement {*x_distance* *y_distance*}

Specifies the maximum allowed displacement in the x- and y-directions from the position specified in the configuration. The distance values are in library units.

When the tool inserts a driver, it starts at the position specified in the configuration and tries to find an unblocked, legal location within the distance specified by this option. If the tool cannot find an unblocked location within this distance, it does not insert that driver.

-offset {*x_distance* *y_distance*}

Specifies the offset to be added to each driver location after positioning the driver, but before searching for an unblocked, legal location. The distance values are in library units.

You can use this option to place drivers on a grid so that they are in the center of each horizontal wire or in the middle of each gap in a mesh.

If you use both this option and the **-offset** option for a specific group in the configuration, the two offsets are added together.

-use_common_bbox

Specifies a single bounding box of load pins for all groups of drivers.

Normally each group of drivers in the configuration uses the geometry of the group below as the bounding box for placement. The higher the hierarchy level

is, the smaller the bounding box area becomes. For some layouts, it is more convenient to have one common bounding box. You should use this option for H-tree layouts.

-check_only

Displays a short report of the number of drivers to be created at each level and their fanouts (without creating drivers). The report is done before the legalization of cell locations, so the values are approximate. Use this option to test and tune your configuration without actually inserting drivers.

When the GUI is open, this option displays the locations of tentative mesh drivers in the GUI. Use the **-remove_display** option to undo the display.

-verbose

Displays additional information about the way drivers are being created and positioned.

DESCRIPTION

If you need to drive a large load of many pins with minimum skew, you generally need to create multiple levels of drivers. You can either manually create such a hierarchy of drivers by using **insert_buffer** repeatedly, or let command like **compile_clock_tree** automatically create them. However, if the load pins are uniformly distributed, **add_clock_drivers** provides some advantages. This command is especially suitable for driving a large clock mesh net.

This command accepts one net, usually a high-fanout net. The net must have exactly one driver pin. When the command is done, the clock net is still connected to its original driver pin, but the original load pins are connected to one or more new nets.

If you use the command to drive a clock mesh (as opposed to a collection of unconnected input pins), you must use the **-short_outputs** option at the lowest level. In a mesh, all load pins are connected by wire straps. To design a mesh, you must add the mesh straps before running this command. If you do not use **-short_outputs**, the loads are connected to the newly created drivers, not to each other. Running this command without this option is appropriate for generating conventional clock tree circuitry where the driver outputs are not shorted together.

The specified command options apply globally to the entire hierarchy of drivers. The configuration lets you specify options in more detail. The two sets of options complement each other. The global options specify the root and loads of the driver tree to be created and affect all drivers in the tree, while the configuration specifies how small a group of drivers or individual drivers should be created.

You must specify a prefix for naming new nets and cells created by this command. The prefix must not be used by other nets or cells in the design. The names of the newly created cells have the following format:

```
<prefix>_L<level_number>_<group_number>_<column>_<row>
```

For example,

```
clka_L1_1_2_3
```

drv_L4_3_7_2

Using a unique prefix enables you to perform operations such as legalizing, routing, or removing the nets and cells that are created by this command.

You should use a short prefix because the command creates many cells and nets.

When nets are created, they share the same name as the cell that drives them. However, if you are driving a mesh, you must specify the name of the large mesh net separately.

You can run this command multiple times with the **-check_only** option to verify that your circuitry has valid inputs and a reasonable structure with legal fanouts and balancing before running the command to insert the drivers and to connect the nets.

You can use this command to insert the cells that drive a mesh net (the mesh drivers) and then use a separate command to create the cells that drive the mesh drivers (the premesh tree). For example, use the **compile_premesh_tree** command after the **add_clock_drivers** command inserts the mesh drivers. This two-step approach provides the advantage of analyzing the mesh driver circuitry and mesh straps before adding the premesh tree. If the mesh drivers and straps do not meet performance requirement, they should be redesigned. A premesh tree cannot improve a poorly designed mesh or set of premesh drivers.

CONFIGURATION STRUCTURE

The configuration is comprised of one or more driver group specifications.

Each group of drivers has a "level" and is specified by a list of options. The options all have the form **-option_name** value, just like a Tcl command. The order of the group specifications is not important. For example, you can specify the level 2 groupings before or after the level 1 groupings. Also, the order of the options with each grouping is not important. For example, you can specify the **-boxes** option before or after the **-driver_type** option. More importantly, you can specify multiple groupings at a single level. For example, you could have three groupings at level 5 with different geometries to fit unbalanced loads or avoid obstacles. Each grouping of drivers must be assigned to a level in the driver hierarchy. Level 0 is the original drive pin or port specified with the **-load** command option. You must not try to define any grouping at level 0. The input pins on the first level (level 1) are connected to the original driving net. The outputs of level 1 drivers are connected to the input pins on level 2, and so forth. Drivers in the highest numbered level drive the original load pins. At least one grouping must appear in the configuration, so there must be at least one grouping at level 1.

The clock tree is built from the bottom (the load pins) up. To add drivers, the tool must know what the drivers should drive and where to place them. The level number determines the default set of pins that should be driven. For each level, the default driven pins are all the pins on the level below, and the default driven region for each group is the bounding box of the driven pins. You can change the set of load pins for a group on the lowest level by specifying an explicit **-drives** option.

The default geometric boundary for placing the new drivers is the same as the driven pin region. You can override this boundary for a group by using the **-boundary**

add_clock_drivers

option. You would typically override these specifications only when the design has obstacles or other complex geometry. If you want all the groups in the configuration to use the same boundary, use the **-use_common_bbox** option at the command level.

When you specify geometries, note that you specify a point as a Tcl list of two distances and a rectangle as a Tcl list of two points.

An example of a simple configuration is

```
{   {-level 1 -boxes {3 2}}
    {-level 2 -boxes {6 4}}
}
```

This creates two groups of drivers. The first group, on level 1, comprises six drivers (three columns and two rows) connected to the top-level driver.

The second group, on level 2, comprises 24 drivers, which are driven by the six drivers on level 1; thus, each of the level 1 drivers has a fanout of 4. The level 2 drivers are arrayed in six columns and four rows. They are spread uniformly over the region defined by the load pins specified in the **-load** command option, because these load pins are implicitly on level 3.

By default, each driver drives those pins that are closest to it.

The configuration file provides various options to help create drivers suitable for a variety of common situations.

For each driver group, you can specify the following configuration options:

```
-level level_number
[-boxes {columns rows}
 | -auto {columns rows}
 | -interior {columns rows}
 | -grid {columns rows}
 | -single_driver point
 | -coincident collection
 | -replicate]
[-drives rectangle | -load collection_of_pins]
[-boundary rectangle]
[-driver_type lib_cell]
[-offset {x_offset y_offset}]
[-short_outputs
  [-output_net_name string [-transfer_wires_from net]]]

-level level_number
    Specifies where in the hierarchy to connect the group of drivers. You must
    specify this option for each grouping. Level 1 is the highest level. The input
    pins of level 1 drivers are driven by the overall driver pin and are therefore
    connected directly to the overall clock net. Level 2 drivers with are driven
    by level 1 drivers. The driver groupings with the highest level number drive
    the loads specified by the -load command option.
    There must not be any gaps in the level numbers. Groups must exist for each
    level from level 1 to your highest level number. If there is a gap, the
    configuration is rejected and the command returns an error.
    You can have any number of groups with the same level. This is useful if you
```

have complex geometry and want to specify particular drivers for particular parts of your design. Note that it would be very rare, but not illegal, to have a level number more than about 10, because each level typically has a fanout of approximately 4 to 8, and 10 levels could drive at least 262144 loads.

-boxes {columns rows}

Specifies an array of drivers that are spread across the rectangle that is the boundary of the group. When you use this option, the drivers are placed at the centers of the boxes that define the loads they serve.

For example, to place six drivers at {50 50}, {50 150}, {150 50}, {150 150}, {250 50}, and {250 150}, specify the following options:

-level 2 -boundary {{0 0} {300 200}} -boxes {3 2}

To picture the result, draw four vertical and three horizontal lines that form six boxes. The drivers are placed at the center of each box.

To specify a column of drivers, set the *columns* argument to 1 and specify the number of drivers that you want in the *rows* argument. To specify a row of driveres, set the *rows* argument to 1 and specify the number of drivers that you want in the *columns* argument. To specify a single driver, set the option argument {1 1}.

-auto {columns rows}

Specifies an array of drivers that are spread across the rectangle that is the boundary of the group. When you use this option, the tool automatically adjusts the driver positions to even out the distance from a driver to its loads.

To picture the result, represent the loads by drawing a pattern of 6 dots wide by 4 dots tall, which are spaced 100 units apart horizontally and vertically, starting at {0 0} and having the upper-right dot at {500 300}. The **-auto {3 2}** option adds six drivers centered in the middle of symmetrical clusters of 4 dots. The drivers are located at {50 50}, {250 50}, {450 50}, {50 250}, {250 250}, and {450 250}. Each driver drives four loads, with an equal distance to each of them.

To specify a column of drivers, set the *columns* argument to 1 and specify the number of drivers that you want in the *rows* argument. To specify a row of driveres, set the *rows* argument to 1 and specify the number of drivers that you want in the *columns* argument. To specify a single driver, set the option argument {1 1}.

-grid {columns rows}

Specifies an array of drivers that are spread on the edges and interior of the rectangle that is the boundary of the group. When you use this option, the drivers are placed on the perimeter of the boundary rectangle.

For example, to place six drivers at {0 0}, {150 0}, {300 0}, {0 200}, {150 200}, and {300 200}, specify the following options:

-boundary {{0 0} {300 200}} -grid {3 2}

To picture the result, draw three vertical and two horizontal lines that form two boxes. Each box is 150 units wide by 200 units tall. The drivers are placed at the intersections of the horizontal and vertical lines.

To specify a column of drivers, set the *columns* argument to 1 and specify the number of drivers that you want in the *rows* argument. To specify a row of driveres, set the *rows* argument to 1 and specify the number of drivers that you want in the *columns* argument. To specify a single driver, set the option argument {1 1}.

This option provides more detailed manual specification than the **-boxes** or -

auto options.

The **-grid** option might be more convenient than the **-boxes** option for placing drivers directly under specific wire segments in the clock wiring mesh. This would be useful for the lowest level that drives the externally specified load.

-interior {columns rows}

Specifies a regular array of drivers that are spread on the interior of the rectangle that is the boundary of the group. When you use this option, the drivers are placed only in the interior and not along the edges.

For example, to place two drivers at {100 100} and {200 100}, enter the following options:

```
-boundary {{0 0} {300 200}} -interior {2 1}
```

To picture the result, draw four vertical lines and three horizontal lines that form six boxes. Each box is 100 units wide by 100 units tall. The two drivers are placed at the four-way intersections of the horizontal and vertical lines in the middle.

To specify a column of drivers, set the *columns* argument to 1 and specify the number of drivers that you want in the *rows* argument. To specify a row of drivers, set the *rows* argument to 1 and specify the number of drivers that you want in the *columns* argument. To specify a single driver, set the option argument {1 1}.

The **-interior** option can be more convenient than the **-grid** option for placing drivers directly under specific wire intersections in the clock wiring mesh.

-single_driver point

Inserts a single driver at the specified point.

-coincident collection

Specifies that a new set of drivers should be allocated on a one-to-one basis with members of the specified collection. Typically, this is a collection of vias that are located at the intersections of the clock mesh. If the clock mesh has already been allocated, you can get the vias with the following command:

```
set vias [get_vias -of clock_net]
```

To specify this configuration to the **add_clock_drivers** command, enter

```
add_clock_drivers -load clk \
    -driver_type buffd7 -use_common_bbox -verbose -prefix ccc \
    -config [list \
        {-level 1 -boxes {1 1}} \
        {-level 2 -boxes {2 2}} \
        {-level 3 -boxes {4 4}} \
        [list -level 4 -coincident $vias -short_outputs \
            -output_net_name clk_mesh]]
```

-replicate

Specifies that a new set of drivers should be allocated on a one-to-one basis with the drivers on the level below the current level. Typically, this is used for allocating pairs of inverters.

-drives rectangle

Specifies that the group drives the loads in the specified rectangle.

By default, the group drives the loads in the entire bounding box of the load pins on the level below.

-load collection_of_pins
 Specifies that the group drives the specified load pins.
 You can use this configuration option only for groups at the lowest level
 that drive a subset of pins specified in the **-load** command option.
 By default, the group drives all load pins on the level below.

-boundary rectangle
 Specifies the boundary for the group of drivers.
 By default, the boundary is determined by the set of load pins that the group
 serves.
 For example, if you want to drive loads on the left side of your design with
 drivers located near the middle of your design, you can use the **-drives**
 configuration option to select the loads and the **-boundary** configuration
 option to specify where to put the drivers.
 The **-boundary** configuration option directly impacts the operation of the **-
 boxes**, **-grid**, and **-auto** configuration options.

-driver_type lib_cell
 Specifies the driver cell to use for the group of drivers.
 By default, the group uses the driver cell specified by the **-driver_type**
 command option. If you do not specify the **-driver_type** command option, you
 must specify this option for each group in the configuration.

-offset {x_distance y_distance}
 Specifies the distance, in library units, to shift each driver from the
 location calculated by the tool.
 The tool calculates a preferred location for each driver in the group. When
 you use this option, the tool first shifts each location by the specified
 horizontal and vertical offset before searching for an unblocked location.
 You can use this configuration option with the **-boxes**, **-single_driver**, **-
 replicate**, and **-grid** configuration options. For example, you can use this
 configuration option with the **-replicate** configuration option to displace the
 newly created driver a small distance from the inverter that it drives.
 If you specify both the **-offset** configuration option and the **-offset** command
 option, the drivers are shifted by the sum of the two offsets.

-short_outputs
 Specifies that the outputs of all the drivers in this group are connected to
 a single net. This option is typically used when the load pins are joined
 together by a grid of wires in a mesh.

-output_net_name string
 Specifies the name of the net driven by the driver group. This option is
 typically used when the load pins are joined together by a grid of wires in
 a mesh and you want to specify the name of the mesh net.
 This option can be used only in conjunction with the **-short_outputs**
 configuration option.

-transfer_wires_from from_net
 Specifies that all of the wires and vias on the specified net are transferred
 to the net specified on the **-output_net_name** option.
 This option enables you to use the following flow:
`create_clock_mesh -load clk -net clk -layers {METAL5 METAL4} \
 -num_straps {16 16}`

```
echo Clock mesh wires are created now
```

```
add_clock_drivers -load clk -driver_type buffd7 -prefix ccc \  
-config { {-level 1 -boxes {1 1}}  
{-level 2 -boxes {2 2} -short_outputs \  
-output_net_name clk_mesh -transfer_wires_from clk}  
}
```

This sequence creates the wires on the original clock net, clk, and then creates a 2-level hierarchy of clock drivers. The second level drives the newly created clk_mesh net and all of the wires and vias that were once on the clk net are now on the clk_mesh net. Note that you can save the design and exit the tool at the point marked "Clock mesh wires are created now". Because the wires are attached to the clk net, which is part of the design with a driver and load, the wires will not be lost during a save and restore cycle.

This option can be used only in conjunction with the **-output_net_name** configuration option.

LIMITATIONS

The quality of results is primarily determined by your specification. If your grouping provides too many or two few drivers or puts the drivers in the wrong location, the tree might be imbalanced or even illegal.

Although you can specify the driver groups and levels in any order, the actual construction of the clock tree is bottom up. That is, it starts with the load pins and works toward the root pin. This command does not optimize the overall geometry.

The placement legalization process is done after the tree is constructed internally, so the relationship between the drivers and their loads might not be as symmetric as simple geometry would suggest.

The presence of large obstructions or irregular geometry can limit the utility of this command.

Multicorner Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example generates a hierarchy of drivers connected to a mesh net. You should run the **legalize_placement** command after running the **add_clock_drivers** command.

```
prompt> add_clock_drivers -load clk1 \  
-prefix clkd_ -driver_type buf2 \  
-configuration { {-level 1 -boxes {6 4} -driver_type buff2}  
{-level 2 -boxes {3 2} -driver_type buff2 \  
-short_outputs -output_net_name clk1mesh}  
}
```

1

Report:

```
Level 0 (overall driver) was port "clk"
Level 1 had 6 cells, max fanout= 4, min fanout=4
Level 2 had 24 cells, max fanout= 6, min fanout=4
Level 3 (overall load) had 100 input pins
```

1

The following example generates a hierarchy of drivers connected to a large number of input pins, but only reports the result. In this case, two columns of drivers comprise level 1 and one column comprises level 2.

The grouping list is created with the Tcl **list** command, which allows the use of Tcl variables and other tool functions.

```
prompt> set loads [get_pins "fflop*/CP"]
prompt> set l2_bound_box [get_bounding_box [get_pins clk2*/CP]]

prompt> set config [list
    {-level 1 -grid {2 1} -boundary {20 400 20 600}}
    [list -level 2 -grid {6 1} -boundary $l2_bound_box]
    {-level 2 -boxes {3 1}}]
]

prompt> add_clock_drivers -load [get_net clkd] -prefix clkd_ \
    -driver_type buf2 -check_only -configuration $config
```

Report:

```
Level 0 (overall driver) was port "inv2/Y"
Level 1 had 2 cells, max fanout= 5, min fanout=4
Level 2 had 9 cells, max fanout= 5, min fanout=3
Level 3 (overall load) had 34 input pins
```

add_distributed_hosts

Adds one or more distributed hosts for distributed jobs.

SYNTAX

```
status add_distributed_hosts
[-target PrimeTime | StarRCXT | all]
[-32bit]
[-enable_ssh]
-farm lsf | grd | generic | now
[-setup_path setup_path]
[-num_of_hosts count]
[-options string]
[-submission_script submission_script]
[work_station_name]
```

ARGUMENTS

```
-target PrimeTime | StarRCXT | all
    Specifies the target application for this configuration. Valid values are
    PrimeTime, StarRCXT, all. Default is all.

-32bit
    This switch is currently not supported in IC Compiler.

-enable_ssh
    By default, remote processes are run with rsh. Enable this switch will ask
    IC Compiler to use ssh to launch remote processes.

-farm lsf | grd | generic | now
    This option is used to specify the type of the farm from which the distributed
    hosts are to be acquired.

-setup_path setup_path
    This option specifies the path to the submission scripts/executables for
    farms of type lsf/grd/generic. The path should contain the following scripts/
    executables.
        -farm lsf the setup_path should contain "qsub", "qdel"
        -farm grd the
        setup_path should contain "bsub", "bkill"
        -farm generic the setup_path should
        contain "gsub", "gdel"
    The -setup_path option is not valid with -farm now

-[num_of_hosts count]
    The user can specify the number of hosts to use in an lsf, grd, generic, or
    now compute environment. The number must be at least 1. If this option is not
    specified then the number of hosts is 1.

-[options string]
    This option is used only in conjunction with -farm lsf | grd | generic. It
    is a list of arguments to be passed off to the submission_script used for job
    submission to a lsf, grd or generic queue.
```

```
- [submission_script]
    The user can explicitly specify the script to call when submitting jobs to
    farm types grd, lsf or generic using this option. When both the -setup_path
    and -submission_script options are used simultaneously, the path and
    submission script specification are combined to define the script used when
    submit jobs to the compute resource being specified.
    The -submission_script option is not valid with -farm now

work_station_name
    Specifies a single UNIX machine. This option is used only in conjunction with
    -farm now.
```

DESCRIPTION

The options for **add_distributed_hosts** depend on whether the user has an on-site load balancing capability and whether they wish to use it or not.

If on-site load balanced facilities are available these should be specified using the -farm lsf, -farm grd or -farm generic options, depending on the type of resource available.

If no on-site load balancing capabilities are available or there are other compute resources available that are not under load balancing control, these should be specified using the -farm now hostname method.

All combinations of resources are concurrently supported by the command, however, each separate type must be specified independently with a separate invocation of the **add_distributed_hosts** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In the following example, two hosts are added for a distributed command. The first host, platinum1, is specified to have 2 hosts and the second, platinum2, is specified to have 4 hosts. The processes on platinum1 will be 64 bit where as the processes on platinum2 will be 32 bit. Notice that the actual number of processors in platinum1 and platinum2 is irrelevant but for optimal performance the number of processes allocated should match the processors in each machine i.e. 2 processors in platinum1 and 4 processors in platinum2.

```
prompt> add_distributed_hosts -farm now -num_of_hosts 2 platinum1
1
prompt> add_distributed_hosts -farm now -num_of_hosts 4 platinum2 -32bit
1
```

To use this command where on-site load balancing capabilities (LSF/GRD/Generic) are

in place, use options -farm grd, -farm lsf, or -farm generic. In the example below, the distributed hosts list is populated by defining four 32 bit hosts from an lsf farm, and two 64 bit hosts from a grd farm.

```
prompt> add_distributed_hosts -farm lsf -setup_path "/bin/lsf/"
-options {-R "tmp>300" -q} -num_of_hosts slaves 4 -32bit
1
prompt> add_distributed_hosts -farm grd -setup_path "/bin/grd/"
-options {-cwd -V -r y -P bnormal -l} -num_of_hosts slaves 2
1
```

add_drc_error_detail

Add shapes to an existing error object with additional details.

SYNTAX

```
status add_drc_error_detail
-drc_error drc_error
-rectangles rectangles
[-net net]
[-layer layer]
[-error_view mw_error_view]
```

Data Types

<i>drc_error</i>	list or collection
<i>net</i>	list or collection
<i>layer</i>	list or collection
<i>mw_error_view</i>	list or collection

ARGUMENTS

```
-drc_error drc_error
The error object to which to add these details. This argument is required.
Error details can only be attached to errors that have been created. Use the
collection returned by create_drc_error or get_drc_errors as argument for
this option. Alternatively, an error may be specified by its object ID.
Specifying more than one error causes an error. The specified error must be
of type in the "Default" type class.

-rectangles rectangles
Rectangle shapes to add to the error. This argument is required.

-net net
The net associated with the shapes as a collection of id or name, if any.

-layer layer
The layer associated with the shapes as a collection of id or name, if any.

-error_view mw_error_view
The error view with the error record receiving the details. If omitted, the
error record is in the current top-level design cell. Specifying more than
one error view causes an error.
```

DESCRIPTION

This command adds shapes and associated details to an existing error object. The command returns 1 if successful, 0 otherwise.

An error type is associated with a type class when it is created. Error objects of a type in a type class receive data interpretation that is specific to that type class. Non-default type classes are: Open, OpenLocator, Short, and Spacing. This

command is appropriate for adding shape details to an error object for a type in the Default type class, with default data interpretation. There are error object creation commands specific to the non-default classes which ensure errors that are correct by construction.

EXAMPLES

The following example creates an error record of the type "Pin made fat" in the current top-level design, then adds details to it:

```
prompt> set errId [create_drc_error -type "Pin made fat"]
{25635}
prompt> add_drc_error_detail -drc_error $errId \
    -net [get_nets myNetName] -layer [get_layers myLayerName] \
    -rectangles {1 {574.0700 430.3600 578.9700 433.4400}}
1
```

SEE ALSO

`create_drc_error(2)`
`create_drc_error_type(2)`
`list_drc_error_types(2)`
`report_drc_error_type(2)`
`get_drc_errors(2)`

add_end_cap

Adds end cap cells at both ends of a cell row.

SYNTAX

```
status add_end_cap
[-mode both | bottom_left | upper_right]
[-mirror]
[-respect_padding]
[-respect_blockage]
-lib_cell lib_cell_name
[-vertical_cells lib_cell_names [-fill_corner]]
[-respect_keepout]
```

Data Types

lib_cell_name collection of one cell

ARGUMENTS

-mode both | bottom_left | upper_right

Specifies how to place end cap cells. The **both** value places the cell at both ends of the row. The **bottom_left** value places the cell at the bottom of a vertical row or to the left of a horizontal row. The **upper_right** value places the cell at the top of a vertical row or to the right of a horizontal row. The default is **both**.

-mirror

Specifies to flip the orientation of the cell when the command places it. By default, this option is off.

-respect_padding

Specifies to respect macro padding so that the command does not place end cap cells in the padding area around a macro. By default, this option is off.

-respect_blockage

Specifies to respect placement blockage so that the command does not place the end cap cells inside placement blockages. By default, this option is off.

-lib_cell lib_cell_name

Specifies the reference library cell to be used as horizontal end caps. Provide only one.

-vertical_cells lib_cell_names

Specifies the names of the reference library cells to be used as vertical end caps. By default, the tool does not add vertical end cap cells.

-fill_corner

Specifies whether to fill corners where vertical and horizontal end caps meet with horizontal end caps. This option has meaning only when you also use the **-vertical_cells** option. By default, the tool does not fill corners.

```
-respect_keepout
    Prevents placing of end caps inside keepout margins around macro cells.
    Keepout margins on other types of cells do not apply.
```

DESCRIPTION

This command allows you to add horizontal end cap cells at both ends of a cell row and, optionally, to add them along horizontal edges. An end cap cell is typically a nonlogic cell added before placement that serves a special purpose to the row, such as a decoupling capacitor. It is your responsibility to provide a proper end cap cell, because the tool can accept any standard cell as an end cap cell. It is your responsibility to provide the proper size vertical cells to avoid possible unfilled gaps.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example adds horizontal end cap cells named MY_END_CAP to the current design.

```
prompt> add_end_cap -lib_cell MY_END_CAP
```

SEE ALSO

`set_keepout_margin(2)`

add_open_drc_error_detail

Add shapes to an existing error object of a type in the Open type class with additional details.

SYNTAX

```
status add_open_drc_error_detail
-drc_error drc_error
-node node_number
-rectangles rectangles
[-layer layer]
[-error_view mw_error_view]
```

Data Types

<i>drc_error</i>	list or collection
<i>node_number</i>	integer
<i>layer</i>	list or collection
<i>mw_error_view</i>	list or collection

ARGUMENTS

-drc_error *drc_error*
The error object to which to add these details. This argument is required. Open error details can only be attached to errors that have been created. Use the collection returned by `create_open_drc_error` or `get_drc_errors` as argument for this option. Alternatively, an error may be specified by its object ID. Specifying more than one error causes an error. The specified error must be of a type in the "Open" type class.

-node *node_number*
The node to which these rectangle shapes belong. This argument is required. See the description section for a discussion on nodes and node numbers.

-rectangles *rectangles*
Rectangle shapes to add to the error. This argument is required.

-layer *layer*
The layer associated with the shapes as a collection of id or name, if any.

-error_view *mw_error_view*
The error view with the error record receiving the details. If omitted, the error record is in the current top-level design cell. Specifying more than one error view causes an error.

DESCRIPTION

This command adds shapes and associated details to an existing error object of an error type in the "Open" type class. The command returns 1 if successful, 0 otherwise.

An error type in the "Open" type class is for violations where routed shapes for a net are not fully connected. An Open type error is described by disjoint nodes. A node is a set of connected route shapes. An open net will contain two or more disjoint nodes. A node may require multiple shape constructs to describe if there are shapes on different layers in the node. Each node is numbered and multiple shapes can be identified as being parts of the same node. Descriptions of node shapes can be added using the -details option of the create_open_drc_error command or with the add_open_drc_error_detail command.

EXAMPLES

The following example opens an error view named "mydesign_idrc.err" and creates an error type named "Open Net" in the "Open" type class, then creates an error record of the type, then adds details:

```
prompt> set cellId [open_mw_cel -not_as_current mydesign_idrc.err]
{mydesign_idrc}
prompt> set typeId [create_drc_error_type -name "Open Net" -class "Open" \
    -info "There are opens in the net" -error_view $cellId]
1024
prompt> set openErrId [create_open_drc_error -type $typeId -error_view $cellId]
{1280}
prompt> add_open_drc_error_detail -error_view $cellId \
    -drc_err $openErrId -node 1 -layer RV \
    -rectangles {{574.0700 430.3600 578.9700 430.3600} \
    {574.0700 436.3600 574.0700 453.3600}}
```

add_pg_pin_to_db

Converts rail or non-pg_pin based logic library (db) into pg_pin based logic library.

SYNTAX

```
status add_pg_pin_to_db

[-mw_library_name mw_lib_name]
[-pg_map_file pg.map]
-output pg_db_filename
[-verbose]
[-pg_map_template pg_pin_map_template_filename]
[-expanded]
```

ARGUMENTS

input_db_filename
Specifies the name of the input logic library (.db) file, which is in non-pg_pin-based format. It is mandatory.

-mw_library_name mw_lib_name
Specifies one or more Milkyway library name(s) (FRAM view) that correspond to the input db file.

-pgap_file pgap
Specifies the file name of mapping between non-pg_pin-based data and pg_pin-based data.

-output pg_db_filename
Specifies the name of new pg_pin-based db file that is generated after the conversion. It cannot be the same name as the input db file. This option is mandatory.

DESCRIPTION

Command **add_pg_pin_to_db** converts rail or non-pg_pin based logic library (db) into pg_pin based logic library. There are three cases: 1) with complete Milkyway library If all cells have single P/G rail (1P1G), -pg_map_file option is not required but -mw_library_name should be specified to derive the mapping from the Milkyway Fram view. If some cells have multiple P/G rails, -pg_map_file is required for those cells. 2) without Milkyway library (db only) If you only specify a logic library (.db), no matter if it is a single P/G rail library or not, you must specify -pg_map_file to make the conversion. 3) with partial Milkyway library If some cells exists in both logic library and Milkyway library while others only exist in logic library, -pg_map_file should be specified for the cells that are missing in the Milkyway library.

EXAMPLES

The following example converts the logic library "old.db" into pg_pin-based "pg.db".

add_pg_pin_to_db

```
prompt> add_pg_pin_to_db old.db -mw_library_name {mw_lib}
          -pg_map_file pg.map -output pg.db
```

SEE ALSO

[add_pg_pin_to_lib\(2\)](#)

add_pg_pin_to_lib

converts rail or non-pg_pin based logic library (.lib) into pg_pin based logic library (.lib).

SYNTAX

```
status add_pg_pin_to_lib

[-mw_library_name mw_lib_name]
[-pg_map_file pg.map]
[-pg_map_template template_filename]
[-expanded]
-output pg_lib_filename
[-common_shell_path common_shell_path]
[-verbose]
```

ARGUMENTS

input_lib_filename
Specifies the name of the input logic library (.lib) file, which is in non-pg_pin-based format. It is mandatory.

-mw_library_name *mw_lib_name*
Specifies one or more Milkyway library name(s) (FRAM view) that correspond to the input db file.

-pgap_file *pgap*
Specifies the file name for mapping between non-pg_pin-based data and pg_pin-based data including PM attributes.

-pg_map_template *template_filename*
Specifies the file name for map template.

-expanded
Specifies to generate expanded map template with wildcard expanded. By default it is OFF meaning compressed map template using wildcards will be generated.

-output *pg_lib_filename*
Specifies the name of new pg_pin-based lib file that is generated after the conversion. It cannot be the same name as the input lib file. This option is mandatory.

DESCRIPTION

Command **add_pg_pin_to_lib** converts rail or non-pg_pin based logic library (.lib) into pg_pin based logic library (.lib). There are three cases: 1) with complete Milkyway library If all cells have single P/G rail (1P1G), -pg_map_file option is not required but -mw_library_name should be specified to derive the mapping from the Milkyway Fram view. If some cells have multiple P/G rails, -pg_map_file is required for those cells. 2) without Milkyway library (.lib only) If you only specify a logic

library (.lib)and no Milkyway library, for a single P/G rail library or multi-rail library, you must specify -pg_map_file to make the conversion. 3) with partial Milkyway library If some cells exists in both logic library and Milkyway library while others only exist in logic library, -pg_map_file should be specified for the cells that are missing in the Milkyway library and for PM cells.

EXAMPLES

The following example converts the logic library "old.lib" into pg_pin-based "pg.lib".

```
prompt> add_pg_pin_to_lib old.lib -pg_map_file pg.map  
-output pg.lib
```

SEE ALSO

[add_pg_pin_to_db\(2\)](#)

add_port_state

Adds state information to a supply port.

SYNTAX

```
string add_port_state
supply_port_name
-state {name nom | min nom max | off}
```

Data Types

supply_port_name string

ARGUMENTS

supply_port_name

Specifies the name of the supply port. Hierarchical names are allowed.

-state {name nom | min nom max | off}

Specifies the name and value of a state of the supply port. You can repeat this option. The state value can be one of the following:

- A single floating point number that represents the nominal voltage for the specified state. For example, to define a state called s88 with a nominal voltage of 0.88, use the following syntax:

```
-state {s88 0.88}
```

- Three floating point numbers that represent the minimum, nominal, and maximum voltages of the specified state, respectively. For example, to define a state called active_state with a minimum voltage of 0.88, a nominal voltage of 0.90, and a maximum voltage of 0.92, use the following syntax:

```
-state {active_state 0.88 0.90 0.92}
```

- The keyword **off**, which indicates an inactive state. For example, to define an inactive state called off_state, use the following syntax:

```
-state {off_state off}
```

DESCRIPTION

This command adds state information to a supply port. The first occurrence of the *supply_port_name* option is the default state of the supply port. You can use this to represent off-chip supply sources that are not driven by the test bench. This option defines the voltage level supplied to the chip; it provides a convenient shortcut to facilitate verification and analysis without requiring the creation of a power domain and a supply network within the verification environment. An error occurs if *supply_port_name* does not already exist prior to executing this command.

This command returns the fully qualified name from the current scope of the created port or a null string if the port is not created.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the states and voltages of a supply port named VN1:

```
prompt> add_port_state VN1 \
-state {active_state 0.88 0.90 0.92} \
-state {off_state off}
```

SEE ALSO

```
add_pst_state(2)
create_pst(2)
report_pst(2)
```

add_pst_state

Defines the states of each of the supply nets for one possible state of the design.

SYNTAX

```
status add_pst_state
state_name
-pst table_name
-state supply_states
```

Data Types

state_name	string
table_name	string
supply_states	list

ARGUMENTS

state_name
Specifies the name of the power state.

-pst table_name
Specifies the power state table (PST) to which this state applies.

-state supply_states
Lists the supply net state names in the corresponding order of the fb-supplies option listing in the **create_pst** command.

DESCRIPTION

The **add_pst_state** command defines the states of each of the supply nets for one possible state of the design. It is an error if the number of supply state names is different from the number of supply nets within the power state table.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines the supply net state names for the s1, s2 and s3 power states:

```
create_pst pt -supplies {PN1 PN2 SOC/OTC/PN3}
add_pst_state s1 -pst pt -state {s08 s08 s08}
add_pst_state s2 -pst pt -state {s08 s08 off}
add_pst_state s3 -pst pt -state {s08 s09 off}
```

SEE ALSO

`add_port_state(2)`
`create_pst(2)`
`report_pst(2)`

add_row

Creates a list of rows in the design.

SYNTAX

```
status add_row
[-in base_array_name]
[-tile_pattern tile_pattern_name]
[-tile_name tile_name]
-area {{ll_x_ll_y}_{ur_x_ur_y}}
[-minimal_channel_height channel_height]
[-direction direction]
[-flip_first_row] | [-no_double_back]
[-no_start_from_first_row]
[-no_snap_to_wire_track]
[-dont_snap_to_existing_row]
[-no_double_back]
```

Data Types

<i>base_array_name</i>	string
<i>tile_pattern_name</i>	string
<i>tile_name</i>	string
<i>channel_height</i>	float
<i>direction</i>	string

ARGUMENTS

```
-in base_array_name
    Specifies the name of the base array in which to create rows. The -in base_array_name, -tile_pattern tile_pattern_name and -tile_name tile_name options are mutually exclusive. By default, this option is off.

-tile_pattern tile_pattern_name
    Specifies the name of the tile pattern to use in rows. The -in base_array_name, -tile_pattern tile_pattern_name and -tile_name tile_name options are mutually exclusive. By default, this option is off.

-tile_name tile_name
    Specifies the name of the unit tile to use in rows. The -in base_array_name, -tile_pattern tile_pattern_name and -tile_name tile_name options are mutually exclusive. The default is the tile name unit for the rows.

-area {{ll_x_ll_y}_{ur_x_ur_y}}
    Specifies the coordinates for the lower-left and upper-right corners of the area in which to create a list of rows.

-minimal_channel_height channel_height
    Specifies the channel height amount to provide for routing between rows. By default, it is 0.0.
```

-direction direction
 Specifies the direction of rows to be created. The valid values for *direction* are **horizontal** and **vertical**. By default, the direction of rows is the same as the direction of the base array where the rows are located.

-flip_first_row
 Specifies to flip a row at the bottom of a horizontal core area or at the left side of a vertical core area. The **-flip_first_row** and **-no_double_back** options are mutually exclusive. By default, this option is off.

-no_start_from_first_row
 Specifies that you do not want a pair of rows at the bottom of a horizontal core area or at the left side of a vertical core area. Normally, the area can contain such pairs. By default, this option is off.

-no_snap_to_wire_track
 Specifies that you do not want the bottom of the horizontal row or the left side of the vertical row to snap to the wire track. Normally, they can. By default, this option is off.

[-dont_snap_to_existing_row]
 Snaps to an existing row. Normally, row positions are not snapped. By default, this option is off.

-no_double_back
 Specifies that you do not want the area to contain pairs of rows with one row in each pair flipped. Normally, the area can contain such pairs. By default, this option is off.

DESCRIPTION

This command adds rows into a specified area. The command returns a value of **1** if it succeeds or **0** if it fails.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates rows in the specified area.

```
prompt> add_row -area {{100 100} {300 300}} -tile unit
Info: 6 rows are added.
1
```

SEE ALSO

`cut_row(2)`

add_tap_cell_array

Adds tap cells to the design, forming a two-dimensional array structure.

SYNTAX

```
integer add_tap_cell_array
[-master_cell_name ]
[-voltage_area {voltage_areas_collection}]
[-distance tap_cell_distance]
[-pattern normal | every_other_row | stagger_every_other_row]
[-offset distance]
[-tap_cell_identifier tap_cell_prefix]
[-tap_cell_separator tap_cell_separator]
[-no_tap_cell_under_layers layer_list]
[-well_port_name port_name]
[-well_net_name net_name]
[-substrate_port_name port_name]
[-substrate_net_name substrate_tie_net_name]
[-connect_power_name power_net_name]
[-connect_ground_name ground_net_name]
[-fill_boundary_row true | false]
[-fill_macro_blockage_row true | false]
[-boundary_row_double_density true | false]
[-macro_blockage_row_double_density true | false]
[-left_macro_blockage_extra_tap_by_rule | must_insert | no_insert]
[-right_macro_blockage_extra_tap_by_rule | must_insert | no_insert]
[-left_boundary_extra_tap_by_rule | must_insert | no_insert]
[-right_boundary_extra_tap_by_rule | must_insert | no_insert]
[-ignore_soft_blockage true | false]
[-at_distance_only true | false]
[-skip_fixed_cells true | false]
[-respect_keepout]
```

Data Types

voltage_areas_collection	collection
tap_cell_distance	float
tap_cell_prefix	string
tap_cell_separator	string
layer_list	list
port_name	string
substrate_tie_net_name	string
power_net_name	string
ground_net_name	string

ARGUMENTS

-master_cell_name *cell_name*
Specifies the name of the library reference cell to be used as a tap cell.

-voltage_area {voltage_areas_collection}
Specifies the voltage areas in which to insert tap fillers. Tap fillers are

add_tap_cell_array

not inserted outside of the specified voltage areas. By default, the command inserts tap fillers in all voltage areas.

-distance tap_cell_distance

Specifies the distance (unit is um) between two tap cells in a row.

-pattern normal | every_other_row | stagger_every_other_row

Specifies the pattern of tap cell insertion. When you use the **normal** argument, tap cells are added to every row having the specified tap distance spacing. The tap distance should be approximately twice the design rule distance limit. When you use the **every_other_row** argument, the command places tap cells in every other row (on the odd rows only). This allows you to reduce the number of required tap cells by approximately half compared to the normal pattern. The tap distance specified in the **every_other_row** argument should be approximately twice the design rule distance limit. When you use the **stagger_every_other_row** argument, the command places tap cells in every row. The tap cells on even rows are offset with half the specified distance relative to the odd rows, producing a checkerboard-like pattern. This pattern also allows you to reduce the number of required tap cells by approximately half compared to the normal pattern. The tap distance specified in this pattern should be four times the design rule distance limit. The default is **normal**.

-offset distance

Specifies the offset distance (unit is um) when you use the **-pattern** option with the **stagger_every_other_row** argument.

-tap_cell_identifier tap_cell_prefix

Specifies the name prefix for inserted tap cells.

-tap_cell_separator tap_cell_separator

Specifies a separator character to be used when composing the instance name of the tap cell. The tap cell instance name consists of a prefix, the library reference cell name, the tap layer number, and a rolling number. For example, the instance name "tapfiller!MY_TAP!98!25" has prefix "tapfiller," the library reference cell name "MY_TAP," the tap layer number "98," the rolling number "25," and the tap_cell_separator "!" This allows you to do pattern matching selection of the tap cells, if necessary.

-no_tap_cell_under_layers layer_list

Avoids placing tap cells under specified metal preroutes.

-well_port_name port_name

Specifies the port name of the well tie.

-well_net_name net_name

Specifies the net name of the well tie.

-substrate_port_name port_name

Specifies the port name of the substrate tie.

-substrate_net_name substrate_tie_net_name

Specifies the net name of the substrate tie.

-connect_power_name power_net_name
 Specifies the net to connect the tap cell's power pin to, if there is more than one power net in the design,

-connect_ground_name ground_net_name
 Specifies the net to connect the tap cell's ground pin to, if there is more than one ground net in the design.

-fill_boundary_row true | false
 Specifies the density adjustment of the tap cell array. When the every_other_row tap placement pattern is specified in the pattern option, ever other row is supposed to be empty to reduce the number of tap cells inserted. This option instructs the tool to fill the section of a row that is adjacent to the chip boundary to avoid tap rule violation. The default setting is true. When set to false, the section of the row adjacent to the chip boundary may need to rely on taps outside the boundary to satisfy the tap distance rule. This option is only effective when the every_other_row tap pattern is selected.

-fill_macro_blockage_row true | false
 Specifies the density adjustment of the tap cell array. When the every_other_row tap placement pattern is specified in the pattern option, ever other row is supposed to be empty to reduce the number of tap cells inserted. This option instructs the tool to fill the section of a row that is adjacent to the macro/blockage boundary to avoid tap rule violation. The default setting is true. When set to false, the section of the row adjacent to the macro/blockage boundary may need to rely on taps outside the boundary to satisfy the tap distance rule. This option is only effective when the every_other_row tap pattern is selected.

-boundary_row_double_density true | false
 Specifies the density adjustment of the tap cell array. When the stagger_every_other_row tap placement pattern is specified in the pattern option , ever other row is supposed to be staggered to reduce the number of tap cells inserted. This option instructs the tool to double the tap density on the section of a row that is adjacent to the chip boundary to avoid tap rule violation. The default setting is true. When set to false, the section of the row adjacent to the chip boundary needs to rely on taps outside the boundary to satisfy the tap distance rule. This option is only effective when the stagger_every_other_row tap pattern is selected.

-macro_blockage_row_double_density true | false
 Specifies the density adjustment of the tap cell array. When the stagger_every_other_row tap placement pattern is specified in the pattern option, ever other row is supposed to be staggered to reduce the number of tap cells inserted. This option instructs the tool to double the tap density on the section of a row that is adjacent to the macro/blockage boundary to avoid tap rule violation. The default setting is true. When set to false, the section of the row adjacent to the macro/blockage boundary needs to rely on taps outside the boundary to satisfy the tap distance rule. This option is only effective when the stagger_every_other_row tap pattern is selected.

-left_macro_blockage_extra_tap by_rule | must_insert | no_insert
 Specifies the density adjustment of the tap cell array. The inter tap distance

is often set to twice the minimum tap rule distance. By default, the tool assumes that the minimum tap distance is half of the inter tap spacing specified in the -distance option. The default setting is by_rule where the tool may insert an extra tap cell at the location of half inter tap spacing near the right edge of a row adjacent to a macro or blockage. This extra tap is inserted if the right row edge is more than half inter tap distance from the closest tap on the same row. The default setting may or may not insert an extra tap but always ensures that the minimum tap distance rule is not violated. When such tap is not needed, the must_insert option forces a tap to be inserted at exactly the right edge of the row. When the default setting needs to insert a tap, the no_insert option forces the tool to skip this insertion. When the no_insert option is used, standard cells near the right side of the row may need to rely on taps inside the macro/blockage to satisfy the tap distance rule. The must_insert option does not always cause a tap to be placed against the right edge of the row. This only happens when the distance to the closest tap is less than half inter tap distance.

```
-right_macro_blockage_extra_tap by_rule | must_insert | no_insert
| no_insert
```

Specifies the density adjustment of the tap cell array. The inter tap distance is often set to twice the minimum tap rule distance. By default, the tool assumes that the minimum tap distance is half of the inter tap spacing specified in the -distance option. The default setting is by_rule where the tool may insert an extra tap cell at the location of half inter tap spacing near the right edge of a row adjacent to a macro or blockage. This extra tap is inserted if the left row edge is more than half inter tap distance from the closest tap on the same row. The default setting may or may not insert an extra tap but always ensures that the minimum tap distance rule is not violated. When such tap is not needed, the must_insert option forces a tap to be inserted at exactly the left edge of the row. When the default setting needs to insert a tap, the no_insert option forces the tool to skip this insertion. When the no_insert option is used, standard cells near the left side of the row may need to rely on taps inside the macro/blockage to satisfy the tap distance rule. The must_insert option does not always cause a tap to be placed against the left edge of the row. This only happens when the distance to the closest tap is less than half inter tap distance.

```
-left_boundary_extra_tap by_rule | must_insert | no_insert
```

Specifies the density adjustment of the tap cell array. The inter tap distance is often set to twice the minimum tap rule distance. By default, the tool assumes that the minimum tap distance is half of the inter tap spacing specified in the -distance option. The default setting is by_rule where the tool may insert an extra tap cell at the location of half inter tap spacing near the left edge of a row adjacent to the design's boundary. This extra tap is inserted if the left row edge is more than half inter tap distance from the closest tap on the same row. The default setting may or may not insert an extra tap but always ensures that the minimum tap distance rule is not violated. When such tap is not needed, the must_insert option forces a tap to be inserted at exactly the left edge of the row. When the default setting needs to insert a tap, the no_insert option forces the tool to skip this insertion. When the no_insert option is used, standard cells near the left side of the row may need to rely on taps outside the design's boundary to satisfy the tap distance rule. The must_insert option does not always cause a tap to be placed against the left edge of the row. This only happens when the distance to the closest tap is less than half inter tap distance.

`-right_boundary_extra_tap by_rule | must_insert | no_insert`
Specifies the density adjustment of the tap cell array. The inter tap distance is often set to twice the minimum tap rule distance. By default, the tool assumes that the minimum tap distance is half of the inter tap spacing specified in the -distance option. The default setting is by_rule where the tool may insert an extra tap cell at the location of half inter tap spacing near the right edge of a row adjacent to the design's boundary. This extra tap is inserted if the right row edge is more than half inter tap distance from the closest tap on the same row. The default setting may or may not insert an extra tap but always ensures that the minimum tap distance rule is not violated. When such tap is not needed, the must_insert option forces a tap to be inserted at exactly the right edge of the row. When the default setting needs to insert a tap, the no_insert option forces the tool to skip this insertion. When the no_insert option is used, standard cells near the right side of the row may need to rely on taps outside the design's boundary to satisfy the tap distance rule. The must_insert option does not always cause a tap to be placed against the right edge of the row. This only happens when the distance to the closest tap is less than half inter tap distance.

`-ignore_soft_blockage true | false`
Instructs the tool to ignore soft blockages during tap cell insertion. The default is false.

`-at_distance_only true | false`
Specifies the density adjustment of the tap cell array. The command uses false by default and inserts extra tap cells besides those inserted at distance and distance/2. When this option is true, the tool inserts tap cells at distance or distance/2 (or distance/4 in stagger mode) only and nowhere else. This could cause DRC violations. This is only effective while four specific options of add_tap_cell_array are set properly as follows:

`-left_macro_blockage_extra_tap by_rule
-right_macro_blockage_extra_tap by_rule
-left_boundary_extra_tap by_rule
-right_boundary_extra_tap by_rule`
By default, they are set to by_rule.

DESCRIPTION

This command adds tap cells to the design, forming a two dimensional array structure. A tap cell is a special nonlogic cell with well and/or substrate ties. Tap cells are typically used when most or all standard cell in the library contain no substrate or well taps. The design rules typically specify a distance limit from every transistor of a standard cell to a well or substrate tie.

This command is used to insert tap cells before global placement so that all standard cells subsequently placed can satisfy the distance limit because of the tap cells that have been inserted. You should properly specify the tap distance and offset based on your specific design rule's distance limit. The command has no knowledge of the design rule's distance limit. A visual check is recommended after this command to ensure that all standard cell placeable areas are properly protected by tap cells. You can select several tap cell placement patterns.

The command can connect a substrate or well port of a tap cell to a specified net.

It can also connect a power or ground port of the tap cells to a specified power or ground net.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> add_tap_cell_array -master_cell_name Cell1\  
-distance 30 -pattern normal\  
-voltage_area [get_voltage_areas "V*"] \  
-no_tap_cell_under_layer {M1, M2}
```

SEE ALSO

```
insert_tap_cells_by_rules(2)  
set_keepout_margin(2)
```

add_to_collection

Adds objects to a collection, resulting in a new collection. The base collection remains unchanged.

SYNTAX

```
collection add_to_collection
base_collection
object_spec
[-unique]
```

Data Types

<i>base_collection</i>	collection
<i>object_spec</i>	list

ARGUMENTS

base_collection

Specifies the base collection to which objects are to be added. This collection is copied to the result collection, and objects matching *object_spec* are added to the result collection. The *base_collection* can be the empty collection (empty string), subject to some constraints as explained in the DESCRIPTION section.

object_spec

Specifies a list of named objects or collections to add. If the base collection is heterogeneous, only collections can be added to it. If the base collection is homogeneous, the object class of each element in this list must be the same as in the base collection. If it is not the same class, it is ignored. From heterogeneous collections in the *object_spec*, only objects of the same class of the base collection are added. If the name matches an existing collection, the collection is used. Otherwise, the objects are searched for in the database using the object class of the base collection.

Some special rules apply to the *object_spec* when the base collection is empty. The rules are explained in the DESCRIPTION section.

-unique

Indicates that duplicate objects are to be removed from the resulting collection. By default, duplicate objects are not removed.

DESCRIPTION

The **add_to_collection** command allows you to add elements to a collection. The result is a new collection representing the objects in the *object_spec* added to the objects in the base collection.

Elements that exist in both the base collection and the *object_spec*, are duplicated in the resulting collection. Duplicates are not removed unless you use the **-unique** option. If the *object_spec* is empty, the result is a copy of the base collection.

If the base collection is homogeneous, the command searches in the database for any elements of the *object_spec* that are not collections, using the object class of the base collection. If the base collection is heterogeneous, all implicit elements of the *object_spec* are ignored.

When the *base_collection* argument is the empty collection, some special rules apply to the *object_spec*. If the *object_spec* is not empty, there must be at least one homogeneous collection somewhere in the *object_spec* list, but its position in the list does not matter. The first homogeneous collection in the *object_spec* list becomes the base collection and sets the object class for the function. The examples show the different errors and warnings that can be generated.

For background on collections and querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example from PrimeTime (using the **get_ports** command) gets all ports beginning with mode, then adds the CLOCK port:

```
prompt> set xports [get_ports mode*]
{"mode[0]", "mode[1]", "mode[2"]}

prompt> add_to_collection $xports [get_ports CLOCK]
{"mode[0]", "mode[1]", "mode[2]", "CLOCK"}
```

The following example from PrimeTime adds the cell u1 to a collection containing the SCANOUT port:

```
prompt> set sp [get_ports SCANOUT]
{"SCANOUT"}

prompt> set het [get_cells u1]
 {"u1"}

prompt> query_objects -verbose [add_to_collection $sp $het]
 {"port:SCANOUT", "cell:u1"}
```

The following examples show how **add_to_collection** behaves when the base collection is empty. Adding two empty collections yields the empty collection. Adding an implicit list of only strings or heterogeneous collections to the empty collection generates an error message, because no homogeneous collections are present in the *object_spec* list. Finally, as long as one homogeneous collection is present in the *object_spec* list, the command succeeds, even though a warning message is generated. The example uses the variable settings from the previous example.

```

prompt> sizeof_collection [add_to_collection "" ""]
0

prompt> set A [add_to_collection "" [list a $het c]]
Error: At least one homogeneous collection required for argument 'object_spec'
      to add_to_collection when the 'collection' argument is empty (SEL-014)

prompt> add_to_collection "" [list a $het $sp]
Warning: Ignored all implicit elements in argument 'object_spec'
to add_to_collection because the class of the base collection
could not be determined (SEL-015)
{"SCANOUT", "u1", "SCANOUT"}

```

In the case where the base collection is empty and it is intended to view the results of add_to_collection in the base collection, the following can be done:

```

prompt> set col {}
prompt> foreach_in_collection i [get_designs *] {
            current_design $i
            set col [add_to_collection $col [get_cells *data_reg*]]
        }

prompt> query_objects $col
{data_reg1 data_reg2}

```

SEE ALSO

[query_objects\(2\)](#)
[remove_from_collection\(2\)](#)
[sizeof_collection\(2\)](#)

add_to_rp_group

Adds a cell, hierarchical group, or keepout to an existing relative placement group.

SYNTAX for Leaf Cells

status **add_to_rp_group**

```
rp_groups
-leaf cell_name
[-column integer]
[-row integer]
[-pin_align_name pin_name]
[-orientation direction]
[-alignment bottom-left | bottom-right]
[-num_rows integer]
[-num_columns integer]
```

Data Types for Leaf Cells

<i>rp_groups</i>	list or collection
<i>cell_name</i>	cell
<i>pin_name</i>	string
<i>direction</i>	list of strings

SYNTAX for Hierarchical Groups

status **add_to_rp_group**

```
rp_groups
-hierarchy group_name
[-instance instance_name]
[-column integer]
[-row integer]
[-alignment bottom-left | bottom-right]
```

Data Types for Hierarchical Groups

<i>group_name</i>	list or collection
<i>instance_name</i>	cell

SYNTAX for Keepouts

status **add_to_rp_group**

```
rp_groups
-keepout keepout_name
[-column integer]
[-row integer]
[-width integer]
[-height integer]
```

`[-type hard | soft | space]`

Data Types for Keepouts

`keepout_name` string

ARGUMENTS

`rp_groups`

Specifies the relative placement groups in which to add an item. The groups must all be in the same design.

`-leaf cell_name`

Specifies the name of a cell to add to the relative placement groups in `rp_groups`. The specified cell must be in the design that contains the relative placement groups in `rp_groups`.

`-column integer`

Specifies the column position in which to add the item. If you do not specify the column position, it defaults to zero.

`-row integer`

Specifies the row position in which to add the item. If you do not specify the row position, it defaults to zero.

`-pin_align_name pin_name`

Specifies the name of the pin to use for pin alignment of this cell with other cells in a group. This overrides the default pin name specified for the relative placement group into which it is being added. This option can only be used when adding a leaf cell with the **-leaf** option.

`-orientation direction`

Specifies the placement orientation of the cell being added. Specify the orientation with respect to the group into which the cell is being added. You can specify the list of possible orientations from which the tool chooses the first legal orientation for the cell. You can specify the direction using DEF syntax:

DEF syntax:

N, W, S, E, FN, FW, FS, FE

This option can only be used when adding a leaf cell with the **-leaf** option.

`-alignment bottom-left | bottom-right`

Specifies the alignment to use when placing the cell or group with respect to its parent group.

If you do not specify this option, IC Compiler uses the alignment method defined for the parent group. If a relative placement group has **-compress** set, and you add an element in that group with **-alignment bottom-right**, then the alignment type of that element is ignored.

`-num_rows integer`

Specifies the number of rows to which you add the leaf cell. You can specify multiple rows, but the default is one if you do not set this option.

`add_to_rp_group`

-num_columns integer
 Specifies the number of columns to which you add the leaf cell. You can specify multiple columns, but the default is one if you do not set this option. You can not use the bottom-right and bottom-pin alignment settings for a leaf cell occupying multiple columns.

-hierarchy group_name
 Specifies the relative placement group to be added hierarchically to the relative placement groups in *rp_groups*.

-instance instance_name
 Specifies the hierarchical cell in which to instantiate the relative placement group specified in **-hierarchy**. The cell must be an instance of the reference design that contains the relative placement group specified in **-hierarchy** and must be in the design containing the relative placement groups specified in *rp_groups*. This option can only be used when adding a relative placement group with the **-hierarchy** option.

-keepout keepout_name
 Specifies the name of the keepout to be added to the relative placement groups in *rp_groups*. Although the keepout is not a design object, you provide a name so you can refer to the keepout after it is created.

-width integer
 Specifies the width of the keepout being added. If you do not specify the width, the keepout defaults to the width of the widest cell in the column into which the keepout is being added. This option can only be used when adding a keepout with the **-keepout** option.

-height integer
 Specifies the height of the keepout being added. If you do not specify the height, the keepout defaults to the height of the tallest cell in the column into which the keepout is being added. This option can only be used when adding a keepout with the **-keepout** option.

-type hard | soft | space
 Specifies whether a keepout is hard or soft or space. A hard keepout keeps everything out of a location during legalization stage. A soft keepout allows non-rp cells to come into its location during legalization stage. A space keepout allows non-rp cells to come into its location during placement. By default a keepout is hard.

-soft

DESCRIPTION

This command adds an item to the specified relative placement groups. The relative placement groups must have been previously defined by using the **create_rp_group** command. The item can be either a leaf cell, a relative placement group, or a keepout. The item is placed in a particular lattice position of the group as specified by a row and column.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **add_to_rp_group** to add a cell to an existing relative placement group and then adds that group hierarchically to another existing group.

```
prompt> get_rp_groups ripple::grp_ripple
{ripple::grp_ripple}

prompt> add_to_rp_group ripple::grp_ripple -leaf carry_in_1
{ripple::grp_ripple}

prompt> add_to_rp_group example3::top_group -hier grp_ripple -instance U2
{example3::top_group}
```

SEE ALSO

```
create_rp_group(2)
remove_rp_groups(2)
write_rp_groups(2)
```

adjust_fp_floorplan

Adjusts an existing floorplan.

SYNTAX

```
status adjust_fp_floorplan
[-core_aspect_ratio real]
[-core_utilization real]
[-core_width real]
[-core_height real]
[-number_rows int]
[-die_width real]
[-die_height real]
[-use_vertical_row sbool]
[-no_double_back sbool]
[-start_first_row sbool]
[-flip_first_row sbool]
[-row_core_ratio real]
[-left_io2core real]
[-right_io2core real]
[-bottom_io2core real]
[-top_io2core real]
[-min_pad_height sbool]
[-maintain_placement]
[-remove.filler_io]
[-die_origin point]
[-sm_utilization string_list]
[{-fc_periphery string | -fc_in_core string}]
```

ARGUMENTS

-core_aspect_ratio *real*

Specify the required Core Aspect Ratio (Core Height/Core Width).

If specified then the core will be resized to achieve this aspect ratio while maintaining the current placement area.

-core_utilization *real*

Specify the required Core Utilization (Core Physical Area/ Core Placement Area).

If specified then the core will be resized to achieve this new placement area which maintaining the current aspect ratio.

-core_width *real*

Specify the required Core Width in microns.

If specified then the core will be resized to achieve this new width while maintaining the current core height.

This option is usually combined with -core_height or -number_rows (for horizontal rows).

-core_height *real*

Specify the required Core Height in microns.

If specified then the core will be resized to achieve this new height while

maintaining the current core width.
This option is usually combined with -core_width or -number_rows (for vertical rows).

-number_rows int
Specify the required Number of Rows.
If specified then the core will be resized to achieve this new number of rows.
For horizontal rows the current core width will be maintained, for vertical rows the current core height will be maintained.

-die_width real
Specify the Die Width in microns.
If specified then the die will be resized to achieve this new width while maintaining the current die height.
This option is usually combined with -die_height.

-die_height real
Specify the Die Height in microns.
If specified then the die will be resized to achieve this new height while maintaining the current die width.
This option is usually combined with -die_width.

-use_vertical_row sbool
Specify cell rows are placed vertically

-no_double_back sbool
Specify cell rows are not double backed.
Double backed rows only have gaps between each row pair (flipped and non-flipped row). Non-double backed rows have gaps between each row.

-start_first_row sbool
Specify cell rows are started with a complete pair (flipped and non-flipped)

-flip_first_row sbool
Specify first cell row is flipped.

-row_core_ratio real
Specify row core ratio, which is the ratio of row height and core height (for horizontal rows) or row width and core width (for vertical rows).

-left_ioore real
Specify distance in microns from core left edge to right edge of the minimum or maximum left pad (depending on the min pad height setting).

-right_ioore real
Specify distance in microns from core right edge to left edge of the minimum or maximum right pad (depending on the min pad height setting).

-bottom_ioore real
Specify distance in microns from core bottom edge to top edge of the minimum or maximum bottom pad (depending on the min pad height setting).

-top_ioore real
Specify distance in microns from core top edge to bottom edge of the minimum or maximum top pad (depending on the min pad height setting).

```

-min_pad_height sbool
    Specify whether core to pad distances are to the smallest pad on the
    corresponding side instead of the default largest pad.

-maintain_placement
    Keep current standard cell and hard macro placement inside the core instead
    of by default invalidating the placement by moving standard cells and hard
    macros outside the core.

-remove_filler_io
    Remove any filler io pads.

-die_origin point
    Set the die origin. This is usually at (0, 0) but can be placed anywhere.

-sm_utilization string_list
    Specify individual soft macro utilizations as a list of strings. Each string
    in the list is of the format:
        sm_name sm_utilization [fc_area_factor]
    the optional flip chip pad/driver area factor can only be supplied if the
    design has flip chip pads/drivers.

-fc_periphery string
    Number of flip chip pads or drivers in the periphery (outside core area). If
    all flip chip pads or drivers are in the periphery the string "all" can be
    used.
    Any flip chip pads or drivers not in the periphery are assumed to be in the
    core and will affect utilization calculations.
    Note: cannot be combined with -fc_in_core.

-fc_in_core string}
    Number of flip chip pads or drivers inside the core. If all flip chip pads
    or drivers are inside the core the string "all" can be used.
    All flip chip pads in the core and will affect utilization calculations.
    Note: cannot be combined with -fc_periphery.

```

DESCRIPTION

This command allows the user to modify the current die/core size by changing one or more values while maintaining as much of the current settings as possible.

The user can change the dir/core size by using one of the following:

- . absolute die size (-die_width and/or -die_height)
- . absolute core size (-core_width and/or -core_height)
- . core size based on number of rows (-number_rows and/or -core_width
or -core_height depending on row direction)
- . core utilization (-core_utilization and/or -core_aspect_ratio)

The user can also additionally change one or more of the following:

- . row geometry (direction, double_back, start_first_row, flip_first_row,
row_core_ratio)
- . core to pads distances

- . die origin
- . specify core to pad distance is to the minimum pad height
(default is maximum pad height)

Note: For all core resizes the die is resized to maintain the core to pad spacing. For all die resizes the core is resized to maintain the core to pad spacing.

By default changing the dir/core invalidates placement so all standard cells and macros are unplaced (moved out of the core area). If the user wants to retain their current placement then the -keep_placement option should be used.

Also after placement blockages and filler pads may be added which will be invalid if the core is resized. Blockages are automatically removed, filler pads can be optionally removed using -remove_filler_io.

When sizing by utilization normally just the total physical area of all standard cells and hard macros will be used to calculate the placement area. If the design has soft macros or has flip chip pads/drivers then the utilization calculation can be adjusted to take these into account.

For soft macros the estimated utilization of each soft macro can be specified. This effectively increases the physical size of the soft macro from just the total physical size of all its child standard cells and hard macros to the physical size divided by the utilization e.g. a utilization of 0.5 will double the physical area of the soft macro.

For flip chip drivers and pads there will be a number that are in the core area and a number that are in the periphery (outside the core area). Those flip chip drivers and pads in the core will decrease the placement area so must be taken into account in the utilization calculation.

The user can specify this number by either the in-core number or the peripheral number. As a convenience this number can be the string "all". By default all flip chip drivers/pads are considered to be in the core.

Also with soft macros and flip chip drivers and pads, a number of flip chip pads/drivers will overlap each soft macro. This number is automatically estimated for each soft macro based on soft macro size and number of in-core flip chip drivers and pads. In addition to this an extra scale factor can be applied to the resultant area to fine tune this.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

Resize core to 1000 x 1000 microns, maintaining the core to pad spacing

```
prompt> adjust_fp_floorplan -core_width 1000 -core_height 1000
```

Change rows to vertical with row core ratio of 0.9

adjust_fp_floorplan

```
prompt> adjust_fp_floorplan -use_vertical_row true -row_core_ratio 0.9
```

```
Change core utilization to 0.9 with soft macro alu1 utilization at 0.5
```

```
prompt> adjust_fp_floorplan -core_util 0.9 -sm_utilization {"alu1 0.5"}
```

SEE ALSO

adjust_fp_io_placement

Adjusts I/O pad placement.

SYNTAX

```
int adjust_fp_io_placement
[-side l | r | t | b]
[-spacing float]
[-pitch float]
[-offset float]
[-undo]
[list of IO cells]
```

ARGUMENTS

-side l | r | t | b

Indicates on which side of the chip are the IO cells to be adjusted. This is mutually exclusive with giving a list of IO cells.

-spacing float

Specifies how much spacing in microns between adjacent IOs. This option is mutually exclusive with -pitch.

-pitch float

Specifies the distance from the center of an IO cell to the center of the adjacent IO cell in microns. This option is mutually exclusive with -spacing.

-offset float

The distance (in microns) between the lower-most (for left and right IOs) or the left-most (for top and bottom IOs) point of all the adjusted IO cells and the bottom edge or left edge of the chip. If no -offset is specified the IO cells will be packed in the center of the appropriate side.

-undo

Undo the movements made in the previous `adjust_fp_io_placement` call. This option is mutually exclusive with all other options. Only one level of undo is supported.

list of IO cells

The IO cells whose placement are to be adjusted. All the selected IOs must be on the same side of the chip. This is mutually exclusive with the -side option.

DESCRIPTION

Allows user to adjust the spacing and location of IO cells. The `adjust_fp_io_placement` command only moves cells with the IO pad type. The IO cells that are moved are marked as FIXED. Any IO-to-IO cell overlaps after the adjustment is done are reported.

adjust_premesh_connection

Connects the load pins in the specified clock tree or subtree either as mesh loads or as part of the premesh tree. If you specify the **-premesh** option, it balances the first-level loads of the premesh tree.

SYNTAX

```
status adjust_premesh_connection
-root root_name
[-premesh | -exclude_pins list_of_pins]
[-operating_condition min | max | min_max]
```

Data Types

root_name net, port, or pin
list_of_pins list

ARGUMENTS

-root *root_name*
Specifies the name of the root of the clock tree or subtree. You can specify a clock net, clock port, or pin that drives a clock tree or subtree.
If you specify a clock net, the command considers all the load pins of that net. If you specify a pin or a port, the command considers the load pins in the fanout of the specified port or pin. A pin is a load pin if it is either a macro pin or has a nonzero phase delay.
This is a required option.

-premesh
Balances the first-level load pins of the specified clock tree or subtree with the isolation buffers that drive the load pins below the mesh.
Use this option only after running the **analyze_subcircuit** command.
This option and the **-exclude_pins** option are mutually exclusive.

-exclude_pins *list_of_pins*
Excludes the specified pins from consideration. The specified pins are connected above the mesh. By default, all load pins in the fanout of the specified clock root are considered.
This option and the **-premesh** option are mutually exclusive.

-operating_condition min | max | min_max
Specifies the operating condition to be used by the clock tree synthesis engine. If you do not specify this option, the maximum operating condition is used.

DESCRIPTION

This command either adjusts the specified load pins (default behavior) or balances the first-level loads of the specified clock tree or subtree (**-premesh** option).

In default mode, the set of load pins is determined by removing the pins specified

in the **-exclude_pins** option from the set of pins derived from the **-root** option. The command connects these load pins either below the mesh or to the premesh tree. If the load pin is a flip-flop clock pin, drives a flip-flop clock pin, or is a macro pin with a large capacitance, the pin is connected below the mesh. If the load pin has a nonzero phase delay, the phase delay is compared to the maximum delay of all branches associated with flip-flops. If the phase delay is greater than the maximum branch delay, the pin is connected to the premesh tree.

If the clock tree has a macro pin with nonzero phase delay and **split_clock_net - isolate_float_pins** is used. The command decides whether to connect the pin to the premesh tree or below the mesh based on the capacitance value and phase delay of the pin.

If the macro pin has high capacitance value, the pin is connected below the mesh because the mesh has high drive strength. If the pin has nominal capacitance value and nonzero phase delay, the pin is connected to the premesh tree. If you need to set the phase delay of the macro pin, use the **set_clock_tree_exceptions** command.

When connecting load pins after the mesh, the command inserts an isolation buffer after the specified clock root and inserts the load pins after the isolation buffer, so that the clock root drives the isolation buffer and the isolation buffer drives the load pins below the mesh.

When connecting load pins to the premesh tree, the command connects the pins to the specified clock root.

In premesh mode, the command uses the **compile_clock_tree** and **optimize_clock_tree** commands to balance the first-level load pins of the specified clock tree.

EXAMPLE

The following command analyzes the load pins connected to the clknet1 net and either connects them to the premesh tree or below the mesh.

```
prompt> adjust_premesh_connection -root clknet1
```

SEE ALSO

`optimize_clock_tree(2)`
`split_clock_net(2)`
`analyze_subcircuit(2)`

alias

Creates a pseudo-command which expands to one or more words, or lists current alias definitions.

SYNTAX

```
string alias
[name] [def]
```

Data Types

<i>name</i>	string
<i>def</i>	string

ARGUMENTS

name

Provides a name of the alias to define or display. The name must begin with a letter, and can contain letters, underscores, and numbers.

def

Expansion of the alias. That is, the replacement text for the alias name.

DESCRIPTION

The **alias** command defines or displays command aliases. With no arguments, the **alias** command displays all currently defined aliases and their expansions. With a single argument, the **alias** command displays the expansion for the given alias name. With more than one argument, an alias is created that is named by the first argument and expanding to the remaining arguments.

You cannot create an alias using the name of any existing command or procedure. Thus, you cannot use **alias** to redefine existing commands.

Aliases can refer to other aliases.

Aliases are only expanded when they are the first word in a command.

EXAMPLES

Although commands can be abbreviated, sometimes there is a conflict with another command. The following example shows you can use **alias** to get around the conflict.

```
prompt> alias q quit
```

The following example shows you can also use **alias** to create a shortcut for commonly used command invocations.

```
prompt> alias include {source -echo -verbose}
prompt> alias rt100 {report_timing -max_paths 100}
```

After the previous commands, the command **include script.tcl** is replaced with **source -echo -verbose script.tcl** before the command is interpreted.

The following examples show how to display aliases using **alias**. Note when displaying all aliases, they are in alphabetical order.

```
prompt> alias rt100
rt100      report_timing -max_paths 100
prompt> alias
include     source -echo -verbose
q          quit
rt100     report_timing -max_paths 100
```

SEE ALSO

`unalias(2)`

align_fp_pins

Physically aligns a set of soft macros (or black box) pins with a set of reference pin objects. These can be terminals or pins on hard macros, IO pad cells, standard cells, internal child hard macros, or another soft macro (or black box).

SYNTAX

```
status align_fp_pins
[-reference object]
[-direction {left | right | top | bottom}]
[-fixed]
[-change_layer_width]
[-order_type {low_to_high | high_to_low | net_connection}]
[-align_with_child_hm_pins]
objects
```

ARGUMENTS

-reference *object*
 reference object
Object specified here is used to resolve ambiguity in cases where the command is unable to determine the reference pin. For example, a specified net connected to a soft macro pin to be aligned is connected to more than one hard macro. In this case the hard macro whose pin is to be used as a reference can be used as the argument to this option. This option can be omitted if the reference macro can be uniquely determined from the arguments supplied without resorting to the multi-level reference pin selection process (see net_connection under -order_type for details). For example, if the macro pin collection given contains pins belonging to the same hard macro, then that hard macro is used as the reference macro. This option may need to be used for alignment involving two soft macros. Note that the command uses the object provided by this option only as a source of information of last resort. Information provided by this option is silently ignored if the command can uniquely determine the reference pin (or terminal), whether or not the argument given is relevant or supplied in error. The argument can be any one of soft macro, black box, hard macro, OI pad cell, terminal, or standard cell.

-direction {left | right | top | bottom}
 direction for alignment
"center" refers to the horizontal or vertical central axis passing through the bounding box of the reference pin object. If the soft macro (or black box) pin to be aligned sits on a horizontal edge, the center of the aligned pin is aligned to the aforementioned vertical central axis. The horizontal central axis is used instead if the aligned pin sits on a vertical edge.
"center" is the default value if this option is not used.
If the reference pin object is a terminal, or a pin on an IO cell or a standard cell, a central axis (horizontal or vertical) of the reference pin object is used regardless of the value the user may have provided.
"left", "right", "top", and "bottom" refer to the reference pin edges to be used as the line of alignment. For example if the reference pin sits on the bottom edge of a hard macro and "-direction left" is specified, the left edge of the soft macro (or black box) pin to be aligned will be made flush with

the left edge of the reference pin.

Visually speaking using "-direction left" or "-direction right" only makes a difference in this case if the reference pin and the aligned pin have different widths. Furthermore, a central axis (horizontal or vertical) of the reference pin is used if the -direction value is incompatible with the location of the aligned pin. Using the same example cited so far, the center of the aligned pin will be aligned with the vertical central axis of the reference pin if either "-direction top" or "-direction bottom" is supplied.

-fixed

pins become fixed after alignment

By default pins are marked "movable" after alignment.

-change_layer_width

Change pin metal layer and width to match reference pin

The final width of the aligned pin is the default width of the target layer, not the width of the reference pin. By default the aligned pin retains its original layer and its width is not changed.

NOTE: In future releases the soft macro pin layer and width will be automatically changed to match the layer of the reference pins. -

change_layer_width will be made hidden, and a new option will be introduced so that the user can retain current pin layer after the alignment is done.

-order_type {low_to_high | high_to_low | net_connection}

methods of aligning with reference pins

There are 3 values that can be specified: net_connection (default), low_to_high, and high_to_low.

net_connection: An aligned pin is moved into alignment with the reference pin that is logically connected to it by a net. When in this mode the command uses net connectivity to automatically determine the reference pins and in many cases this can save the user from having to explicitly specify the reference pins in the argument collection. For example, if the soft macro pin to be aligned is connected to a net whose only other connection is to another soft macro pin, then the latter soft macro pin is assumed to be the reference pin if the user provides the first (but not the second) soft macro pin in the argument collection. In fact the command works harder than that. If reference pin object can not be uniquely determined because the net connected to the pin to be aligned is connected to multiple other objects, a multi-level priority scheme is used to automatically determine the reference pin object:

1. Non-soft macro pins in the argument list
2. Pins on the reference object specified with -reference
3. Fixed soft macro pins
4. Other soft macro or black box pins
5. Hard macro pins
6. IO pad cell pins
7. Terminals
8. Other standard cell pins

Preference is given to the closest pin object when multiple pin objects exist within the same level. Suppose the net is not connected to any other soft macro or black box but is connected to two hard macro pins and an IO pad pin. Then the reference pin is assumed to be the hard macro pin closer to the pin to be aligned. However, the IO pad pin is used as the reference if the user explicitly includes the IO pad pin in the argument collection or specifies the IO pad cell as the argument for -reference.

low_to_high: For example if alignment is done on a horizontal edge and there are 4 reference pins and 3 pins on the other macro to be aligned.

With this option value the pins are aligned in pairs starting from pins having the lowest original horizontal coordinate. The 4th reference pin (i.e. the reference pin with the largest horizontal coordinate) is not used in the

alignment. Pins on vertical edges are operated according to their vertical coordinates.

`high_to_low`: This is the opposite of `low_to_high`. Using the same example above the first reference pin will not be used in the alignment.

There's no difference between `low_to_high` and `high_to_low` if the number of reference and aligned pins are the same. Note the original pin orders of the aligned pins are preserved for both `low_to_high` and `high_to_low` -- the aligned pin with the lowest original coordinate still has the lowest coordinate among the aligned pins.

NOTE: This option is not effective if `-align_with_child_hm_pins` is used, or if the reference pin object is a terminal or a pin of an IO cell or standard cell. In these cases `net_connection` is the sole alignment method.

NOTE: In future releases `net_connection` will no longer be explicitly available. All alignment will be assumed to be aligned by net connection unless `high_to_low` or `low_to_high` is specified. This option will also be given a more appropriate name.

`-align_with_child_hm_pins`

Align with child HM pins

The reference pin are hard macro pins inside a soft macro.

objects

collection of pins, nets, or reference terminals (if needed)

This collection can minimally consist of the set of soft macro (or black box) pins to be aligned. Reference pins (or terminals) can be added if they are needed to resolve any ambiguity regarding designation of reference pins. In `-order_type` `net_connection` mode, which is the default, the command tries its best to automatically determine the reference pins via net connection. See the section for `-order_type` for details. As such the user needs to supply reference pins (or terminals) as arguments only when absolutely necessary, or when `low_to_high` or `high_to_low` is used as value for `-order_type`, since net connection is not used as the basis for alignment and as such reference pins can not be determined from net connectivities.

Net arguments are also acceptable but they can not be mixed with pins and/or reference terminals: the collection should be a homogeneous set of nets. Also note that any terminal supplied is used as a reference. This command does NOT align terminals. They are considered fixed.

DESCRIPTION

This command physically aligns a set of unfixed soft macros pins with a set of reference terminals or pins on soft macros, hard macros, IO pad cells, or standard cells. Fixed soft macro pins will not be aligned.

Aligned pins are automatically snapped to the closest current snap type. Use `get_object_snap_type -type port_shape` to find out current snap type. The default snap type is wiretrack. For this reason pins may not be perfectly aligned if the reference pins and aligned pins are of different sizes, or if they are on different layers and the wiretrack grids of these layers are not aligned. If perfect alignment is desired current snap type can be set to min grid: `set_object_snap_type -type port_shape -snap litho` Perfect alignment is impossible if the reference pins are not snapped to min grid.

NOTE: Alignment will still go ahead if even the aligned pin shorts with another pin

after the alignment, although a warning will be issued. Furthermore, no other pin position legality check is performed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
align_fp_pins -reference mac1 [get_pins "mac1/A mac1/B mac1/C mac2/A mac2/B mac2/C"]
```

Align specified soft macro pins with "mac1" as the reference macro.

SEE ALSO

```
set_object_snap_type(2)  
get_object_snap_type(2)
```

align_objects

Aligns one or more objects.

SYNTAX

```
status align_objects
[{-anchor object | -parent |
-to value_point_rect}]
[-side alignment_side]
[-offset float]
[-resize]
[-keep_area]
[-ignore_fixed]
objects
```

Data Types

alignment_side	string
objects	collection

ARGUMENTS

-anchor *object*

Specifies the object to which other objects are aligned.

-parent

Specifies that objects are aligned to the parent edge.

-to *value_point_rect*

Specifies that objects are aligned to the position specified by *value_point_rect*.

This position can be a single value (x for left/right, y for top/bottom), a point, or a rectangle.

-side *alignment_side*

Specifies the side of the object and anchor object to be aligned.

The valid value is one of **left**, **right**, **top**, **bottom**, **hcenter**, and **vcenter**.

The description of the valid values are as follows:

left - indicates to use the left side

right - indicates to use the right side

top - indicates to use the top side

bottom - indicates to use the bottom side

hcenter - indicates to use the horizontal center

vcenter - indicates to use the vertical center

The default depends on the aspect ratio (height/width) of the object's surrounding bbox.

If the aspect ratio is less than or equal to 1, then **left** is the default, otherwise, **bottom** is the default.

-offset *float*

Specifies the offset from the specified anchor object's side.

The default value is **0.0**.

```

-resize
    Specifies to resize the object when aligning.

-keep_area
    Specifies to keep the original object's area when resizing.
    By default, the command does not keep the object's area.

-ignore_fixed
    Specifies to align fixed objects as well as unfixed objects.
    By default, the command does not align fixed objects.

objects
    Specifies a list of objects to align.

```

DESCRIPTION

This command aligns a list of unfixed objects so that their left, right, top, or bottom edges are coincident with, or at a specified offset from, an anchor object or anchor position.

The user can specify an anchor object or anchor position, or allow the command to automatically determine the anchor object from the supplied list of objects by using the following algorithm:

- If any objects are marked as fixed then the anchor object is selected from the set of fixed objects. The rightmost, leftmost, bottommost, or topmost fixed object for alignment of left, right, top, and bottom, respectively.
- If no objects are marked as fixed, then the anchor object is taken as the leftmost, rightmost, topmost, or bottommost object for alignment of left, right, top, and bottom, respectively.

When aligning an object, the position of the opposite edge can be retained so that the object is resized rather than moved.

The position of the other sides of the object is also retained unless you specify that the area is to be kept, in which case the other sides are moved to achieve the original object area.

When you do not specify the **-resize** option, any movable object can be aligned. If you do specify it, only resizable objects can be aligned.

See the man page for the **get_edit_property** command for details on which objects you can move and resize.

The tool automatically performs snapping of the origin, bounding box, or points using global snap settings unless you specify the **-no_snap** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example moves the currently selected objects so that their left edges are 20 units from the left edge of the core.

```
prompt> align_objects [get_selection] -parent -offset 20
```

set_object_snap_type(2)
```

all_active_scenarios

Lists the active scenarios available in memory.

SYNTAX

```
string all_active_scenarios
```

ARGUMENTS

None.

DESCRIPTION

This command displays all active scenarios currently in memory. This list excludes scenarios that are inactive.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example uses **all_active_scenarios** to list the active scenarios.

```
prompt> create_scenario MODE1
prompt> create_scenario MODE2
prompt> create_scenario MODE3
prompt> set_active_scenarios {MODE1 MODE3}
prompt> all_active_scenarios
MODE1 MODE3
```

SEE ALSO

create_scenario(2)
current_scenario(2)
remove_scenario(2)
set_active_scenarios(2)
```

all_ao_cellsfp

Returns a collection of always-on cells available in the design.

SYNTAX

```
collection all_ao_cellsfp
```

DESCRIPTION

The **all_ao_cells** command returns a collection of existing always-on cells in the design. If the design has dual-powered marked always-on cells, they are returned by this command. However, if the design has always-on power guides that contain regular cells, those cells are also returned by this command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

```
get_always_on_logic(2)
```

all_bounds_of_cell

Returns the collection of all bounds in the specified list of cells from the design.

SYNTAX

```
collection all_bounds_of_cell
cell_list
```

Data Types

cell_list list

ARGUMENTS

cell_list

Specifies the list of all cells for which to determine the bounds. This can be a simple list or it can be an entire collection manipulation command, enclosed in square brackets [], that returns a collection of cells.

DESCRIPTION

This command returns the collection of all the group or move bounds of a specified cell list. You can use wild cards, such as an asterisk (*) or question mark (?), when specifying the input cell list.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the returned collection of all bounds of cells named *cell1*, *cell2*, and *cell3*.

```
prompt> all_bounds_of_cell {cell1 cell2 cell3}
{cell_bound1 cell_bound2 cell_bound3}
```

The following example shows the returned collection of all bounds of cells in the *u** cell list. In this case, the command returns the collection specified by the **get_cells** command operating on *u**.

```
prompt> all_bounds_of_cell [get_cells u*]
{my_bound1 my_bound2}
```

Following example shows the returned collection of all the bounds of cells in the

SBLK subdesign. In this case, the command returns the collection specified by the **get_cells** command operating on *SBLK*.

```
prompt> all_bounds_of_cell [get_cells SBLK/*]  
{bound1 bound2}
```

SEE ALSO

```
create_bounds(2)  
foreach_in_collection(2)  
get_cells(2)  
remove_bounds(2)  
report_bounds(2)  
sizeof_collection(2)
```

all_cells_in_bound

Returns the collection of all cells in the specified list of group bounds and move bounds from the design.

SYNTAX

```
collection all_cells_in_bound
{bound_list}
```

Data Types

bound_list list

ARGUMENTS

{*bound_list*}

Specifies all the lists of bounds for which to determine cells. The tool returns the collection of the bounds.

DESCRIPTION

This command returns the collection of all the cells from the specified group and move bounds. These bounds are created by using the **create_bound** command. This command inputs a list of multiple bounds and returns a collection of cells from all of them. The tool searches the entire design hierarchy. It returns cells from the entire design, not just from the top level.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the returned collection of all cells in the *my_bound1* bound, which was created by using the **create_bound** command.

```
prompt> all_cells_in_bound {my_bound1}
{cell11 top/cell12 top/cell14 cell10}
```

The following example shows the returned collection of all cells from multiple bounds given as a list. The list is composed of **my_bound1** and **my_bound2**.

```
prompt> all_cells_in_bound {my_bound1 my_bound2}
{cell11 cell12 cell13 cell14 cell15}
```

`sizeof_collection(2)`

all_clocks

Returns a collection of all clocks in the current design.

SYNTAX

```
collection all_clocks
```

ARGUMENTS

This command has no arguments.

DESCRIPTION

Returns a collection containing all clocks in the current design. The clocks must be defined in the design before running this command. To create clocks, use the **create_clock** command. To remove clocks, use **remove_clock**. To list detailed information about all clocks in the design, use **report_clock**.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example applies the **set_dont_touch_network** command to all clocks in the current design.

```
prompt> set_dont_touch_network [all_clocks]
```

SEE ALSO

```
create_clock(2)
remove_clock(2)
report_clock(2)
set_dont_touch_network(2)
current_design(3)
```

all_connected

Returns the objects connected to a net, port, pin, net instance, or pin instance.

SYNTAX

```
collection all_connected
[-leaf] object
```

Data Types

object string

ARGUMENTS

-leaf

Specifies that only leaf pins are returned for a hierarchical net. For nonhierarchical nets, there is no difference in output.

object

Specifies the object whose connections are returned. The object must be a net, port, pin, net instance, or pin instance.

DESCRIPTION

Returns a collection of objects connected to the specified net, port, pin, net instance, or pin instance. A net instance is a net in the hierarchy of the design. A pin instance is a pin on a cell in the hierarchy of a design.

If **-leaf** is used, then a list of leaf pins of the net is returned.

To connect nets to ports or pins, use **connect_net**. To break connections, use **disconnect_net**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **all_connected** to return the objects connected to MY_NET:

```
prompt> all_connected MY_NET

prompt> connect_net MY_NET OUT3
Connecting net 'MY_NET' to port 'OUT3'.

prompt> connect_net MY_NET U65/Z
Connecting net 'MY_NET' to pin 'U65/Z'.
```

```
prompt> all_connected MY_NET
{OUT3 U65/Z}

prompt> all_connected OUT3
{MY_NET}

prompt> all_connected U65/Z
{MY_NET}
```

This next example uses **all_connected** to associate net load capacitance with the net n47, which is connected to the pin instance C/Z:

```
prompt> set_load 0.147 [all_connected [get_pins U0/U1/C/Z]]
Set "load" attribute to 0.147 for net "U0/U1/n47"
```

SEE ALSO

`all_inputs(2)`
`all_outputs(2)`
`connect_net(2)`
`create_net(2)`
`current_design(2)`
`disconnect_net(2)`
`remove_net(2)`

all_connectivity_fanin

Reports pins, ports, or cells in the fanin of specified sinks.

SYNTAX

```
list all_connectivity_fanin
    -to sink_list
    [-startpoints_only]
    [-only_cells]
    [-flat]
    [-levels count]
```

Data Types

<i>sink_list</i>	list
<i>count</i>	int

ARGUMENTS

-to *sink_list*
Reports a list of sink pins, ports, or nets in the design and connectivity based fanin of each sink in the *sink_list*. If you specify a net, the effect is the same as listing all driver pins on the net.

-startpoints_only
Returns only the connectivity startpoints.

-only_cells
Results in a set of all the cells in the connectivity fanin of the *sink_list*.

-flat
Specifies to function in the flat mode of operation. The two major modes in which **all_connectivity_fanin** functions are hierarchical (default) and flat. When in hierarchical mode, only objects from the same hierarchy level as the current sink are returned. Thus, pins within a level of hierarchy lower than that of the sink are used for traversal but they will not be reported.

-levels *count*
Stops traversal when reaching the perimeter of the search of *count* hops, where counting is performed over the layers of cells that are of equidistant from the sink.

DESCRIPTION

This command reports the connectivity fanin of specified sink pins, ports, or nets in the design. A pin is considered to be in the connectivity fanin of a sink if there is a path through combinational logic from the pin to that sink. The fanin report stops at the clock pins of registers (sequential cells).

NOTE: This command reports same results as `all_fanin` except the cases 1. *false paths* are not considered in this commands 2. manually created clocks are not treated as

```
paths start points
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples show the connectivity fanin of a port in the design. The design comprises three inverters in a chain named *iv1*, *iv2*, and *iv3*. The *iv1* and *iv2* inverters are hierarchically combined in a larger cell named *ii2*.

```
prompt> all_connectivity_fanin -to tout
{"ii2/hin", "iv3/in", "iv3/out", "tin", "ii2/hout", "tout"}

prompt> all_connectivity_fanin -to tout -flat

{"ii2/iv1/U1/a", "ii2/iv2/U1/z", "tin", "iv3/U1/a", "ii2/iv1/U1/z",
"ii2/iv2/U1/a", "iv3/U1/z", "tout"}
```

SEE ALSO

```
all_fanin(2)
all_fanout(2)
report_transitive_fanin(2)
```

all_connectivity_fanout

Returns a set of pins, ports, or cells in the fanout of the specified sources.

SYNTAX

```
list all_connectivity_fanout
    -from source_list
    [-endpoints_only]
    [-only_cells]
    [-flat]
    [-levels count]
```

Data Types

<i>source_list</i>	list
<i>count</i>	int

ARGUMENTS

-from *source_list*
Specifies a list of source pins, ports, or nets in the design. The connectivity fanout of each source in *source_list* is reported. If a net is specified, the effect is the same as listing all load pins on the net.

-endpoints_only
Returns only connectivity endpoints as a result.

-only_cells
Results in a set of all cells in the connectivity fanout of the *source_list*, rather than a set of pins or ports.

-flat
Specifies to function in the flat mode of operation. The two major modes in which **all_connectivity_fanout** functions are hierarchical (default) and flat. When in hierarchical mode, only objects from the same hierarchy level as the current source are returned. Thus, pins within a level of hierarchy lower than that of the source are used for traversal but are not reported.

-levels *count*
Stops traversal when reaching the perimeter of the search of *count* hops, where counting is performed over the layers of cells that are of equidistant from the source.

DESCRIPTION

This command reports the connectivity fanout of specified source pins, ports, or nets in the design. A pin is considered to be in the connectivity fanout of a sink if there is a path through combinational logic from that source to the pin. The fanout report stops at the inputs to registers (sequential cells).

NOTE: This command reports same results as `all_fanout` except the cases 1. `false`

paths are not considered in this command 2. manually created clocks are not treated as paths start points

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the connectivity fanout of a port in the design. The design comprises three inverters in a chainnamed *iv1*, *iv2*, and *iv3*. The *iv1* and *iv2* inverters are hierarchically combined in a larger cell named *ii2*.

```
prompt> all_connectivity_fanout -from tin
{"iv3/out", "tout", "iv3/in", "ii2/hin", "ii2/hout", "tin"}

prompt> all_connectivity_fanout -from tin -flat
{"tout", "ii2/iv2/U1/z", "ii2/iv1/U1/a", "iv3/U1/z", "iv3/U1/a",
 "ii2/iv2/U1/a", "ii2/iv1/U1/z", "tin"}

prompt> all_connectivity_fanout -from tin -levels 1 -only_cells
{"iv3", "ii2"}
```

SEE ALSO

```

```

all_critical_cells

Returns a collection of critical leaf cells in the top hierarchy of the current design.

SYNTAX

```
collection all_critical_cells
[-slack_range range_value]
```

Data Types

range_value float

ARGUMENTS

-slack_range *range_value*

Specifies a margin of slack for searching top-hierarchy leaf cells in paths whose slacks are in the specified *range_value* relative to the worst slack of the current design. A top-hierarchy leaf cell is a cell in the top hierarchy and with no hierarchy underneath. The *range_value* must be expressed in the same units as the technology library used during optimization. In addition, *range_value* must be positive or 0.0. If no *range_value* is specified, the default is 0.0. A *range_value* of 0.0 means that top-hierarchy leaf cells in the most critical paths (the ones with the worst violations) are returned. If a positive *range_value* is specified, all top-hierarchy leaf cells are returned if they are in near-critical paths with slacks in the *range_value* relative to the worst slack of the current design.

DESCRIPTION

Returns a collection of leaf cells that are in the top hierarchy and in some path with a slack in the *range_value* relative to the worst slack of the current design. This command returns only those cells with no hierarchy underneath. If all timing paths passing through a cell are unconstrained, the cell is assumed to be non-critical, and thus is not returned. You can use this command, along with the **group** command, to group together into a new subhierarchy those cells in the most critical paths. Then, you can try various optimization techniques on the new subhierarchy.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example lists all top-hierarchy leaf cells in the worst critical paths of the current design.

```
prompt> all_critical_cells
```

The following example lists all top-hierarchy leaf cells in those paths within range 5.0 relative to the worst slack of the current design.

```
prompt> all_critical_cells -slack_range 5.0
```

The following example groups all top-hierarchy leaf cells in the worst critical paths into a new hierarchy, called CRIT, under the top hierarchy of the current design.

```
prompt> group [all_critical_cells] -design_name CRIT
```

The following example reports cell connections of all top-hierarchy leaf cells in the worst critical paths of the current design.

```
prompt> report_cell -connections [all_critical_cells]
```

SEE ALSO

`all_critical_pins(2)`
`current_design(2)`
`group(2)`
`report_cell(2)`

all_critical_pins

Returns a collection of critical endpoints or startpoints in the current design.

SYNTAX

```
collection all_critical_pins
[-type endpoint | startpoint]
[-slack_range range_value]
```

Data Types

range_value float

ARGUMENTS

-type endpoint | startpoint

Specifies that the pins or ports to be searched are either timing endpoints or timing startpoints. The default is 'endpoint'.

-slack_range range_value

Specifies a margin of slack for searching timing endpoints (or startpoints) in paths whose slacks are in the specified *range_value* relative to the worst slack of the current design. The *range_value* must be expressed in the same units as the technology library used during optimization. In addition, *range_value* must be positive or 0.0. If no *range_value* is specified, the default is 0.0. A *range_value* of 0.0 means that endpoints (or startpoints) in the most critical paths (the ones with the worst violations) will be returned. If a positive *range_value* is specified, endpoints (or startpoints) in near-critical paths with slacks in the *range_value* relative to the worst slack of the current design will be returned.

DESCRIPTION

Returns a collection of endpoints (or startpoints) which are in some timing path with a slack in the *range_value* relative to the worst slack of the current design. For a pin, if all timing paths passing through it are unconstrained, it is assumed to be non-critical, and thus it will not be returned. Usually, this command may be used together with **all_fanin** or **all_fanout** commands to report some useful information (e.g., cells in the transitive timing fanin cone of the most critical endpoints).

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example lists all endpoints in the worst critical paths of the current design.

```
prompt> all_critical_pins
```

The following example lists all startpoints in those paths within range 5.0 relative to the worst slack of the current design.

```
prompt> all_critical_pins -type startpoint -slack_range 5.0
```

The following example reports cells in the 3-level transitive fanin timing cone of endpoints in the worst critical paths.

```
prompt> report_cell [all_fanin -to [all_critical_pins] \  
-only_cells -levels 3 -flat]
```

The following example reports the logic in the transitive fanin of endpoints in the worst critical paths of the current design.

```
prompt> report_transitive_fanin -to [all_critical_pins]
```

SEE ALSO

```

group(2)
```

all_designs

Returns a collection containing all designs in the current design.

SYNTAX

```
collection all_designs
```

ARGUMENTS

There are no arguments to this command.

DESCRIPTION

The **all_designs** command returns a collection containing the designs in the current design hierarchy in bottom-up order. You must set the current design using the **current_design** command before using **all_designs**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

`current_design(2)`

all_dont_touch

Returns a collection of **dont_touch** cells or nets from the current design or from the specified input collection.

SYNTAX

```
collection all_dont_touch
-cells | -nets
[input_coll]
```

Data Types

input_coll string

ARGUMENTS

-cells
Specifies that all cells with the **dont_touch** attribute are to be returned.
The **-cells** and **-nets** options are mutually exclusive: use only one.

-nets
Specifies that all nets with the **dont_touch** attribute are to be returned. The **-cells** and **-nets** options are mutually exclusive: use only one.

input_coll
Searches the specified input collection and returns the collection of cells or nets having the **dont_touch** attribute. Objects are to be searched only from the content of *input_coll* rather than from the entire design. By default, this option is off.

DESCRIPTION

This command returns the collection of cells or nets that have the **dont_touch** attribute from the design or from a list that you can specify. You can use wild cards, such as an asterisk (*) or question mark (?), when specifying the input cell list.

The command returns a standard Tcl collection. You can perform all of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, on this collection handle.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example shows the collection of all cells with the **dont_touch** attribute in the design.

all_dont_touch

```
prompt> all_dont_touch -cells
{U20 U21 U23 SBLK/U1 SBLK/U2}
```

The following example shows the collection of all nets with the **dont_touch** attribute from an existing collection where *COLL* is its handle.

```
prompt> all_dont_touch -nets $COLL
{n2 n5 SBLK/n2}
```

SEE ALSO

sizeof_collection(2)
```

all_drc_violated_nets

Returns a collection of DRC-violated nets from the current design or from the specified input collection.

SYNTAX

```
collection all_drc_violated_nets
-max_capacitance | -max_transition | -max_fanout
[input_coll]
[-bound upper]
[-threshold threshold]
```

Data Types

<i>input_coll</i>	collection
<i>upper</i>	float
<i>threshold</i>	float

ARGUMENTS

-max_capacitance
Returns the collection of maximum capacity nets that violate design rule checking (DRC), as designated by **drc_violated_nets**.

-max_transition
Returns the collection of maximum transition nets that violate DRC, as designated by **drc_violated_nets**.

-max_fanout
Returns the collection of maximum fanout nets that violate DRC, as designated by **drc_violated_nets**.

input_coll
Searches the specified input collection and returns the requested collection of nets that violate DRC constraints. Objects are searched only from the contents of the specified input collection, rather than from the design.

-bound *upper*
Captures all DRC-violated nets that have values less than or equal to the bound specified by *upper*. By default, this option is off.

-threshold *threshold*
Captures all DRC-violated nets that have values greater than or equal to the threshold specified by *threshold*. By default, this option is off.

DESCRIPTION

The command returns a collection of DRC-violated nets from the current design or from the specified input collection. The tool can search the entire design hierarchy. It returns DRC-violated nets from the entire design, not just from the top level.

all_drc_violated_nets

This command returns the three most common types of DRC violations: max_capacitance, max_transition, and max_fanout. You can specify each of the violations separately in this command. If you do not specify an option, a collection of all three types of DRC-violated nets is returned.

The command returns a standard Tcl collection. You can perform all of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, on this collection handle.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example shows the collection of all maximum capacity DRC-violated nets from the design.

```
prompt> all_drc_violated_nets -max_cap
{n1 n2 n3 abc/n14}
```

The following example shows the collection of all **-max_fanout** DRC-violated nets from an existing collection stored in \$COLL.

```
prompt> all_drc_violated_nets -max_fanout $COLL
{n1 n3 abc/n14}
```

SEE ALSO

```
foreach_in_collection(2)
sizeof_collection(2)
```

all_fanin

Reports pins, ports, or cells in the fanin of specified sinks.

SYNTAX

```
collection all_fanin
-to sink_list
[-startpoints_only]
[-exclude_bboxes]
[-break_on_bboxes]
[-only_cells]
[-flat]
[-levels count]
```

Data Types

<i>sink_list</i>	list
<i>count</i>	int

ARGUMENTS

```
-to sink_list
    Reports a list of sink pins, ports, or nets in the design and a timing fanin
    of each sink in the sink_list. If you specify a net, the effect is the same
    as listing all driver pins on the net.

-startpoints_only
    Returns only the timing startpoints.

-exclude_bboxes
    Excludes blackboxes from the final result.

-break_on_bboxes
    Stops timing fanin traversal on blackboxes.

-only_cells
    Results in a set of all the cells in the timing fanin of the sink_list.

-flat
    Specifies to function in the flat mode of operation. The two major modes in
    which all_fanin functions are hierarchical (default) and flat. When in
    hierarchical mode, only objects from the same hierarchy level as the current
    sink are returned. Thus, pins within a level of hierarchy lower than that of
    the sink are used for traversal but are not reported.

-levels count
    Stops traversal when reaching the perimeter of the search of count hops, where
    counting is performed over the layers of cells that are of equidistant from
    the sink.
```

DESCRIPTION

This command reports the timing fanin of specified sink pins, ports, or nets in the design. A pin is considered to be in the timing fanin of a sink if there is a timing path through combinational logic from the pin to that sink. The fanin report stops at the clock pins of registers (sequential cells).

Multicorner-Multimode Support

Depending on the options used, this command either uses the current scenario or has no dependency on scenario-specific information.

EXAMPLES

The following examples show the timing fanin of a port in the design. The design comprises three inverters in a chain named *iv1*, *iv2*, and *iv3*. The *iv1* and *iv2* inverters are hierarchically combined in a larger cell named *ii2*.

```
prompt> all_fanin -to tout
{ii2/hin iv3/in iv3/out tin ii2/hout tout}

prompt> all_fanin -to tout -flat
{ii2/iv1/U1/a ii2/iv2/U1/z tin iv3/U1/a ii2/iv1/U1/z
ii2/iv2/U1/a iv3/U1/z tout}
```

SEE ALSO

`all_fanout(2)`
`report_transitive_fanin(2)`

all_fanout

Returns a set of pins, ports, or cells in the fanout of the specified sources.

SYNTAX

```
collection all_fanout
  -clock_tree
  -from source_list
  [-endpoints_only]
  [-exclude_bbboxes]
  [-break_on_bbboxes]
  [-only_cells]
  [-flat]
  [-levels count]
```

Data Types

<i>source_list</i>	list
<i>count</i>	int

ARGUMENTS

```
-clock_tree
  Uses all clock source pins and/or ports in the design as the list of sources.
  Clock sources are specified by using the create_clock command. If there are
  no clocks, or if the clocks have no sources, the report is empty. Use the
  report_clock command to list the sources for all clocks in the design. The -clock_tree
  option generates a report that displays the clock trees or
  networks in the design. The -clock_tree and -from options are mutually
  exclusive.

-from source_list
  Specifies a list of source pins, ports, or nets in the design. The timing
  fanout of each source in source_list is reported. If a net is specified, the
  effect is the same as listing all load pins on the net. The -clock_tree and
  -from options are mutually exclusive.

-endpoints_only
  Returns only timing endpoints as a result.

-exclude_bbboxes
  Excludes blackboxes from the final result.

-break_on_bbboxes
  Stops timing fanout traversal on blackboxes.

-only_cells
  Results in a set of all cells in the timing fanout of the source_list, rather
  than a set of pins or ports.

-flat
  Specifies to function in the flat mode of operation. The two major modes in
```

which **all_fanout** functions are hierarchical (default) and flat. When in hierarchical mode, only objects from the same hierarchy level as the current source are returned. Thus, pins within a level of hierarchy lower than that of the source are used for traversal but are not reported.

-levels count

Stops traversal when reaching the perimeter of the search of *count* hops, where counting is performed over the layers of cells that are of equidistant from the source.

DESCRIPTION

This command reports the timing fanout of specified source pins, ports, or nets in the design. A pin is considered to be in the timing fanout of a sink if there is a timing path through combinational logic from that source to the pin. The fanout report stops at the inputs to registers (sequential cells). The source pins or ports are specified by using the **-clock_tree** or **-from source_list** option.

Multicorner-Multimode Support

Depending on the options used, this command either uses the current scenario or has no dependency on scenario-specific information.

EXAMPLES

The following example shows the timing fanout of a port in the design. The design comprises the following three inverters in a chain, iv1, iv2, and iv3. The iv1 and iv2 inverters are hierarchically combined in a larger cell named ii2.

```
prompt> all_fanout -from tin
{iv3/out tout iv3/in ii2/hin ii2/hout tin}

prompt> all_fanout -from tin -flat
{tout ii2/iv2/U1/z ii2/iv1/U1/a iv3/U1/z iv3/U1/a
ii2/iv2/U1/a ii2/iv1/U1/z tin}

prompt> all_fanout -from tin -levels 1 -only_cells
{iv3 ii2}
```

SEE ALSO

all_fanin(2)
create_clock(2)
report_clock(2)
report_transitive_fanout(2)

all_fixed_placement

Returns the collection of all fixed-placement cells or ports in the design or from a list of objects in the input collection.

SYNTAX

```
collection all_fixed_placement
          -cells | -ports
          [input_coll]
```

Data Types

input_coll collection

ARGUMENTS

-cells

Specifies that the collection of fixed-placement cells is to be returned. If you specify this option, you must not specify the **-ports** option: They are mutually exclusive.

-ports

Specifies that the collection of fixed-placement ports is to be returned. If you specify this option, you must not specify the **-cells** option: They are mutually exclusive. All the ports which are either having implicit *is_fixed* attribute or valid location are treated as fixed-placement ports

input_coll

Specifies the input collection to search and return the collection of fixed-placement objects. Objects are to be searched only from the the content of the specified input collection rather than from the design.

DESCRIPTION

This command can return the collection of all fixed-placement objects in the design. The tool searches the entire design hierarchy. It returns fixed-placement objects from the entire design, not just from the top level.

If you specify a value for *input_coll*, the command searches for fixed-placement objects only from the specified collection, rather than from the entire design.

If you do not specify either the **-cells** or **-ports** option, the **all_fixed_placement** command returns an error.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the collection of all fixed-placement cells from the design.

```
prompt> all_fixed_placement -cells
{"ii2/hin", "iv3/in", "iv3/out", "tin", "ii2/hout", "tout"}
```

The following example shows the collection of all fixed-placement ports from the design.

```
prompt> all_fixed_placement -ports
{"hin", "in", "out", "tin", "hout", "tout"}
```

The following example shows the collection of all fixed-placement cells from an existing collection stored in \$COLL.

```
prompt> all_fixed_placement -cells $COLL
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

SEE ALSO

```
foreach_in_collection(2)
remove_dont_touch_placement(2)
set_dont_touch_placement(2)
sizeof_collection(2)
```

all_high_fanout

Returns a collection of high-fanout nets from the current design or from the specified input collection.

SYNTAX

```
collection all_high_fanout
-nets
[-threshold value]
[input_coll]
[-through_buf_inv]
```

Data Types

<i>value</i>	float
<i>input_coll</i>	collection

ARGUMENTS

-nets
Specifies that the collection of high-fanout nets is to be returned.

-threshold *value*
Specifies a threshold value used to determine if a net is high-fanout net. The *value* is a user-specified value. By default, the "high_fanout_net_threshold" value is used to determine if a net is a high-fanout net.

input_coll
Search the specified input collection for high_fanout nets. Objects are to be searched only from the the contents of the specified input collection rather than from the design.

-through_buf_inv
Indicates to treat a buffer tree as transparent. The leaf loads of the buffer tree are treated as the fanouts of the net.

DESCRIPTION

This command can return the collection of all high-fanout nets in the design. The tool searches the entire design hierarchy. It returns nets from the entire design, not just from the top level.

To determine if a net is a high-fanout net, use the **high_fanout_net_threshold** variable value as the threshold value. The command returns all nets with a fanout count higher than this threshold as high-fanout nets. You can also specify the threshold by using the optional **-threshold** option.

If you specify a value for *input_coll*, the command searches for high-fanout objects only from the specified collection, rather than from the entire design.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection handle.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the collection of all the high-fanout nets from the design.

```
prompt> all_high_fanout -nets
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

The following example shows the collection of all the high-fanout nets from an existing collection stored in \$COLL.

```
prompt> all_high_fanout -nets $COLL
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

The following example shows the collection of all the high-fanout nets from the design having a fanout count of more than 100.

```
prompt> all_high_fanout -nets -threshold 100
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

SEE ALSO

`sizeof_collection(2)`

all_ideal_nets

Returns a collection of ideal nets from the current design or from the specified input collection.

SYNTAX

```
collection all_ideal_nets
[input_coll]
```

Data Types

input_coll collection

ARGUMENTS

input_coll

Specifies the input collection to search for ideal nets.

If you do not specify this argument, the command searches for ideal nets in the current design.

DESCRIPTION

This command returns a collection of ideal nets.

If you specify a value for *input_coll*, the command searches for ideal nets only in the specified collection.

If you do not specify a collection, the command searches for ideal nets in the current design. The tool searches the entire design hierarchy. It returns ideal nets from the entire design, not just from the top level.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection handle.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection of all ideal nets from the design.

```
prompt> all_ideal_nets
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

The following example returns a collection of all ideal nets from an existing collection stored in \$COLL.

```
prompt> all_ideal_nets $COLL
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

SEE ALSO

`all_fanout(2)`
`foreach_in_collection(2)`
`sizeof_collection(2)`

all_inputs

Returns a collection of input or inout ports in the current design.

SYNTAX

```
collection all_inputs
[-clock clock_name]
[-edge_triggered | -level_sensitive]
```

Data Types

clock_name string

ARGUMENTS

```
-clock clock_name
      Limits the search to ports that have input delay relative to clock_name.
-edge_triggered
      Limits the search to ports that have edge-triggered input delay as specified
      by set_input_delay -clock.
-level_sensitive
      Limits the search to ports that have level-sensitive input delay as specified
      by set_input_delay -level_sensitive.
```

DESCRIPTION

Returns a collection of all input or inout ports in the current design, unless one of the options limits the search. The **all_inputs** command is usually used with a command that places attributes on input ports. To get detailed information on ports in the current design, use the **report_port** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example lists all input ports in the current design.

```
prompt> all_inputs
{A1 A2 BIDIR1}
```

The following example sets the drive value of all the input ports on the current design to 10:

```
prompt> set_drive 10.0 [all_inputs]
```

The following example marks with a multicycle value of 0 all paths from inputs having level-sensitive input delay relative to PHI1 to level-sensitive registers clocked by PHI1.

```
prompt> set_multicycle_path 0 \
    -from [all_inputs -clock PHI1 -level_sensitive] \
    -to [all_registers -data_pins -clock PHI1]
```

SEE ALSO

`set_drive(2)`
`set_input_delay(2)`
`set_multicycle_path(2)`

all_isolation_cellsfp

Returns a collection of isolation cells available in the design.

SYNTAX

```
collection all_isolation_cellsfp
```

DESCRIPTION

The **all_isolation_cells** command returns a collection of the existing isolation cells in the design. The enabled level shifters also work as isolation cells, but that type of cell is not returned by this command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

```
check_mv_design(2)  
all_level_shifters(2)
```

all_level_shiftersfp

Returns a collection of level-shifter cells available in the design.

SYNTAX

```
collection all_level_shiftersfp
[-type els | simple]
```

ARGUMENTS

-type els | simple

Specifies the type of level-shifter cells to include in the collection. If you specify -type els, the command returns only the enabled level-shifter cells. If you specify -type simple, the command returns only regular level-shifter cells. If you do not specify this option, the command returns all level-shifter cells.

DESCRIPTION

The **all_level_shifters** command returns a collection of existing level-shifter cells in the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

`check_level_shifters(2)`

all_macro_cells

Returns a collection of all macro cells in the design or from a list of objects in the input collection.

SYNTAX

```
collection all_macro_cells
[input_coll]
```

Data Types

input_coll collection

ARGUMENTS

input_coll

Specifies the input collection to search and return the collection of macro cells. Objects are to be searched only from the the content of the specified input collection rather than from the design.

DESCRIPTION

This command can return the collection of all macro cells from the design. The tool searches the entire design hierarchy. It returns cells from the entire design, not just from the top level. This command uses the same definition as used in the legalizing process to determine if a cell is a macro cell.

If you specify a value for *input_coll*, the command searches for macro cells only from the specified collection, rather than from the entire design.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the collection of all macro cells from the design.

```
prompt> all_macro_cells
{"macro1", "top/macro2", "top/macro4", "macro10"}
```

The following example shows the collection of all macro_cells from an existing collection stored in \$COLL.

```
prompt> all_macro_cells $COLL
```

```
{macro1 macro2}
```

SEE ALSO

```
foreach_in_collection(2)
sizeof_collection(2)
set_cell_type(2)
```

all_mtcmos_cellsfp

Returns a collection of MTCMOS cells available in the design.

SYNTAX

```
collection all_mtcmos_cellsfp
[-type coarse | fine]
```

ARGUMENTS

-type coarse | fine

Specifies the type of the MTCMOS cell to include in the collection.

If you specify -type coarse, the command returns only the coarse-grained MTCMOS cells. If you specify -type fine, the command returns only the fine-grained MTCMOS cells. If you do not specify this option, the command returns all MTCMOS cells.

DESCRIPTION

The **all_mtcmos_cells** command returns a collection of existing MTCMOS cells in the design.

all_objects_in_bounding_box

Returns the collection of all cells and/or nets in the specified bounding box in the design or from a list of objects in the input collection.

SYNTAX

```
collection all_objects_in_bounding_box
-cells | -nets
[-phys_cells]
-coordinates {llx lly urx ury}
[-flat]
[input_coll]
```

Data Types

<i>llx</i>	integer
<i>lly</i>	integer
<i>urx</i>	integer
<i>ury</i>	integer
<i>input_coll</i>	collection

ARGUMENTS

-cells
Specifies that all the cells from the bounding box are to be returned. The **-cells** and **-nets** options are mutually exclusive; you can use only one.

-nets
Specifies that all the nets from the bounding box are to be returned. The **-cells** and **-nets** options are mutually exclusive; you can use only one.

-phys_cells
Returns only physical-only cells.

-coordinates {*llx lly urx ury*}
Specifies the coordinates of the area from which the objects are to be returned.

-flat
Gets cells or nets inside ilm.

input_coll
Specifies the input collection to search and from which to return the collection of cells or nets from the specified bounding box. Objects are to be searched only from the the content of the specified input collection, rather than from the design.

DESCRIPTION

This command can return the collection of all objects from the rectangular area (bounding box) specified by the coordinates described by the **-coordinates** option.

The tool searches the entire design hierarchy. It returns objects from the entire design, not just from the top level.

If you do not specify the **-cell** or **-nets** option, the command returns a collection of both objects together from the specified bounding box.

If you specify a value for *input_coll*, the command searches for objects only from the specified collection, rather than from the entire design. You must specify bounding box coordinates; this command does not provide a default.

A standard Tcl collection is returned. All of the generic collection-manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the collection of all cells in the bounding box described by the 10 10 90 90 coordinates from the design.

```
prompt> all_objects_in_bounding_box -cells \
-coordinate {10 10 90 90}
{u1 u2 u3 abc/u14}
```

The following example shows the collection of all nets in the bounding box described by the 10 10 90 90 coordinates from the design.

```
prompt> all_objects_in_bounding_box -nets \
-coordinate {10 10 90 90}
{n1 n2 n3 abc/n14}
```

SEE ALSO

```
foreach_in_collection(2)
sizeof_collection(2)
```

all_outputs

Returns a collection of output or inout ports in the current design.

SYNTAX

```
collection all_outputs
[-clock clock_name]
[-edge_triggered | -level_sensitive]
```

Data Types

clock_name string

ARGUMENTS

```
-clock clock_name
      Limits the search to ports that have output delay relative to clock_name.
-edge_triggered
      Limits the search to ports that have edge-triggered output delay as specified
      by set_output_delay -clock.
-level_sensitive
      Limits the search to ports that have level-sensitive output delay as
      specified by set_output_delay -level_sensitive.
```

DESCRIPTION

Returns a collection of all output or inout ports in the current design, unless one of the options limits the search. The **all_outputs** command is usually used with a command that places attributes on output ports. To get detailed information on ports in the current design, use the **report_port** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example lists all output ports.

```
prompt> all_outputs
{OUT1 OUT2 BIDIR1}
```

The following example sets a capacitive load of 3.5 on each output port.

```
prompt> set_load 3.5 [all_outputs]
```

The following example sets paths leading to output ports clocked by TSTCLK to be

false.

```
prompt> set_false_path -to [all_outputs -clock TSTCLK]
```

SEE ALSO

[all_inputs\(2\)](#)
[current_design\(2\)](#)
[report_port\(2\)](#)

[set_load\(2\)](#)
[set_output_delay\(2\)](#)

all_physical_only_cells

Returns a collection of all physical-only (filler) cells in the design or from a list of objects in the input collection.

SYNTAX

```
collection all_physical_only_cells
[-lib_cells lib_list | -cell_name list]
[-coordinates {llx lly urx ury}]
[input_coll_handle]
```

Data Types

<i>lib_list</i>	list
<i>list</i>	list
<i>llx</i>	float
<i>lly</i>	float
<i>urx</i>	float
<i>ury</i>	float
<i>input_coll_handle</i>	collection

ARGUMENTS

-lib_cells *lib_list*

Specifies a list of library cells. The tool searches physical-only cells of these library cell types. The default is to return all physical-only cells from the entire design area or from whatever option you specify.

-cell_name *list*

Specifies the base instance name filler cells to be searched from the design. The default is to return all physical-only cells from the entire design area or from whatever option you specify.

-coordinates {*llx lly urx ury*}

Specifies the coordinates of the area from which to return the physical-only cells. The default is to return all physical-only cells from the entire design area or from whatever option you specify.

input_coll_handle

Specifies the input collection to search and from which to return the collection of physical-only cells. Objects are to be searched only from the the content of the specified input collection rather than from the design. The default is to return all physical-only cells from the entire design area or from whatever option you specify.

DESCRIPTION

This command returns the collection of all physical-only cells from the design. The tool searches the entire design hierarchy. It returns physical-only cells from the entire design, not just from the top level.

You can use wild cards, such as an asterisk (*) or question mark (?), when specifying cell instances names.

A standard Tcl collection is returned. All of the generic collection-manipulating commands, such as the **foreach_in_collection** and **sizeof_collection** commands, for example, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example collects all the physical-only cells from the design.

```
prompt> all_physical_only_cells
{fill11 fill12 fill13 abc/fill14}
```

The following example collects all physical-only cells from the design that have a lib cell of type *OKOAFILLER*.

```
prompt> all_physical_only_cells -lib_cell OKOAFILLER
{hin in out tin hout tout}
```

The following example collects all the physical-only cells from an existing collection stored in \$COLL.

```
prompt> all_physical_only_cells $COLL
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

The following example collects all physical-only cells from the design that have an instance name starting with *fill*.

```
prompt> all_physical_only_cells -cell_name fill*
{fill11 fill12 fill13}
```

SEE ALSO

all_physical_only_nets(2)
all_physical_only_ports(2)
foreach_in_collection(2)
sizeof_collection(2)

all_physical_only_nets

Returns a collection of all physical-only nets in the design or from a list of objects in the input collection.

SYNTAX

```
collection all_physical_only_nets
[input_coll]
```

Data Types

input_coll collection

ARGUMENTS

input_coll

Specifies the input collection to search and return the collection of physical-only nets. Objects are to be searched only from the the content of the specified input collection rather than from the design.

DESCRIPTION

This command can return the collection of physical-only nets from the design. The tool searches the entire design hierarchy. It returns physical-only nets from the entire design, not just from the top level. It returns power and ground nets together: They are not returned separately.

If you specify a value for *input_coll*, the command searches for physical-only nets only from the specified collection, rather than from the entire design.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection of all physical-only nets from the design.

```
prompt> all_physical_only_nets
{pnet1 pnet2 gnd vcc}
```

The following example returns a collection of all the physical-only nets from an existing collection stored in \$COLL.

```
prompt> all_physical_only_nets $COLL
{vcc vdd gnd vcc5}
```

SEE ALSO

```
all_physical_only_cells(2)
all_physical_only_nets(2)
foreach_in_collection(2)
sizeof_collection(2)
```

all_physical_only_ports

Returns a collection of all physical-only ports in the design or from a list of objects in the input collection.

SYNTAX

```
collection all_physical_only_ports
[input_coll]
```

Data Types

input_coll collection

ARGUMENTS

input_coll

Specifies the input collection to search and return the collection of physical-only ports. Objects are to be searched only from the the content of the specified input collection rather than from the design.

DESCRIPTION

This command can return the collection of all physical-only ports from the design. The tool searches the entire design hierarchy. It returns physical-only ports from the entire design, not just from the top level.

If you specify a value for *input_coll*, the command searches for physical-only ports only from the specified collection, rather than from the entire design.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection of all physical-only ports from the design.

```
prompt> all_physical_only_ports
{port1 port2 port3}
```

The following example returns a collection of all the physical-only ports from an existing collection stored in \$COLL.

```
prompt> all_physical_only_ports $COLL
```

```
{pport portp1 pport2}
```

SEE ALSO

```
all_physical_only_cells(2)
all_physical_only_nets(2)
foreach_in_collection(2)
sizeof_collection(2)
```

all_registers

Returns a collection of sequential cells or pins in the current design.

SYNTAX

```
collection all_registers
[-no_hierarchy]
[-clock clock_name]
[-rise_clock rise_clock_name]
[-fall_clock fall_clock_name]
[-cells]
[-data_pins]
[-clock_pins]
[-slave_clock_pins]
[-output_pins]
[-inverted_output]
[-level_sensitive | -edge_triggered]
[-master_slave]
```

Data Types

<i>clock_name</i>	string
<i>rise_clock_name</i>	string
<i>fall_clock_name</i>	string

ARGUMENTS

-no_hierarchy

Limits the search to only the current level of hierarchy. Subdesigns are not searched. By default, this option is off.

-clock *clock_name*

Considers only sequential cells clocked by *clock_name* in the search. By default, this option is off.

-rise_clock *rise_clock_name*

Considers only sequential cells clocked by *rise_clock_name* and having the open edge effectively the rising clock edge. By default, this option is off.

-fall_clock *fall_clock_name*

Considers only sequential cells clocked by *fall_clock_name* and having the open edge effectively the falling clock edge. By default, this option is off.

-cells

Returns a collection sequential cells that meet the search criteria. This is the default. If no object type is specified in the command (**-cells**, **-data_pins**, **-clock_pins**, etc.), then the command returns a collection of sequential cells.

-data_pins

Returns a collection of data pins of the sequential cells that meet the search criteria.

```

-clock_pins
    Returns a collection of clock pins of the sequential cells that meet the
    search criteria.

-slave_clock_pins
    Returns a collection of slave clock pins of master-slave registers that meet
    the search criteria. Slave clock pins are specified as "clocked_on_also" in
    the library.

-output_pins
    Returns a collection of output pins of the sequential cells that meet the
    search criteria.

-inverted_output
    Limits the search to flip-flops that have their output phase inverted with
    respect to the original HDL description. In Design Compiler, the
    compile_seqmap_enable_output_inversion variable determines whether the
    compile command allows sequential elements to have their output phase
    inverted.

-level_sensitive
    Limits the search to level-sensitive cells.

-edge_triggered
    Limits the search to edge-triggered cells.

-master_slave
    Limits search to master_slave cells.

```

DESCRIPTION

This command returns a collection of sequential cells or pins in the current design, filtered as specified by the options. By default, the command returns a collection of all sequential cells in the design. If you specify *clock_name*, it considers only the sequential cells in the transitive fanout of the sources of the clock. You can use one or more of the options **-cells**, **-data_pins**, **-clock_pins**, **-slave_clock_pins**, or **-output_pins** to return a collection containing the respective types of objects. For example, if you use **-data_pins**, the command returns a collection containing the only the data pins of the sequential cells that meet the search criteria. If you use both **-cells** and **-data_pins**, the command returns a collection containing both the sequential cells and their data pins.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example sets max_delay targets for timing paths leading to data pins of all registers clocked by *PHI2*.

```
prompt> set_max_delay 10.0 -to [all_registers -clock PHI2 -data_pins]
```

The following example returns a list of data pins for all master-slave registers clocked by *clockB*.

```
prompt> all_registers -master_slave -data_pins -clock clockB
```

The following example returns a list of all level-sensitive cells and their clock (enable) pins.

```
prompt> all_registers -level_sensitive -cells -clock_pins
```

The following example shows how to push into an instance named *U1* and find level-sensitive cells without searching subdesigns of that instance.

```
prompt> current_instance U1
prompt> all_registers -no_hierarchy
```

SEE ALSO

```
create_clock(2)
current_design(2)
current_instance(2)
remove_clock(2)
set_max_delay(2)
```

all_rp_groups

Returns a collection of specified relative placement groups and all groups in their hierarchy.

SYNTAX

```
collection all_rp_groups
[rp_groups]
```

Data Types

rp_groups list or collection

ARGUMENTS

rp_groups
Specifies the relative placement groups for which to search.
If you do not specify this argument, the command returns a collection containing all relative placement groups currently loaded in memory.

DESCRIPTION

The **all_rp_groups** command returns a collection of specified groups and all subgroups in their hierarchy. If you do not specify *rp_groups*, the command returns all relative placement groups currently loaded in memory. This command is supported only for designs that do not contain multiply-instantiated designs.

If no relative placement groups are found, the command returns an empty string.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **all_rp_groups** command:

```
prompt> get_rp_groups
{mul::grp_mul ripple::grp_ripple example3::top_group}

prompt> all_rp_groups
{mul::grp_mul ripple::grp_ripple example3::top_group}

prompt> all_rp_groups ripple::grp_ripple
{ripple::grp_ripple mul::grp_mul}
```

```
prompt> remove_rp_groups -all -quiet  
1
```

```
prompt> all_rp_groups
```

`create_rp_group(2)`
`remove_rp_groups(2)`

all_rp_hierarchicals

Returns a collection of hierarchical relative placement groups that contain specified groups in their hierarchy. The specified groups can be either included or instantiated in their parent group.

SYNTAX

```
collection all_rp_hierarchicals
[rp_groups]
```

Data Types

rp_groups list or collection

ARGUMENTS

rp_groups

Specifies the relative placement groups whose ancestor groups are to be in the collection returned by this command. The specified groups can be either included or instantiated in their parent group.

If you do not specify this argument, this command returns a collection containing all hierarchical relative placement groups currently loaded in memory.

DESCRIPTION

The **all_rp_hierarchicals** command returns a collection of hierarchical groups that are ancestors of the relative placement groups specified in *rp_groups*. This command is supported only for designs that do not contain multiply-instantiated designs.

If you do not specify *rp_groups*, the command returns a collection containing all hierarchical relative placement groups currently loaded in memory.

If no relative placement groups are found, the command returns an empty string.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **all_rp_hierarchicals** command:

```
prompt> get_rp_groups
{b::top a0::a0_group b::u_top/a1_group
 b::u_top/a1_group_include b::u_nxt/a1_group
```

```
b::a1_group_include a1::a1_group}

prompt> all_rp_hierarchicals
{b::a1_group_include b::u_nxt/a1_group
 b::u_top/a1_group_include b::u_top/a1_group b::top}

prompt> all_rp_hierarchicals b::u_top/a1_group_include
{b::u_top/a1_group}

prompt> remove_rp_groups -all -quiet
1

prompt> all_rp_hierarchicals
```

all_rp_inclusions

Returns a collection containing of hierarchical relative placement groups that include the specified groups.

SYNTAX

```
collection all_rp_inclusions
[rp_groups]
```

Data Types

rp_groups list or collection

ARGUMENTS

rp_groups

Specifies the included relative placement groups whose parent groups are to be included in the collection returned by this command.
If you do not specify this argument, this command returns a collection containing all hierarchical relative placement groups in the design that contain included groups.

DESCRIPTION

The **all_rp_inclusions** command returns a collection containing the hierarchical groups that include the relative placement groups specified in *rp_groups*. If you do not specify *rp_groups*, this command returns a collection containing all hierarchical relative placement groups currently in memory that include other relative placement groups. This command is supported only for designs that do not contain multiply-instantiated designs.

If no relative placement groups are found, the command returns an empty string. Relative Placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **all_rp_inclusions** command:

```
prompt> get_rp_groups
{mul::grp_mul mul::big_grp ripple::grp_ripple
 example3::g2 example3::top_group}

prompt> all_rp_inclusions
{mul::big_grp example3::g2}
```

```
prompt> all_rp_inclusions mul::grp_mul  
{mul::big_grp}  
  
prompt> remove_rp_groups -all -quiet  
1  
  
prompt> all_rp_inclusions
```

all_rp_instantiations

Returns a collection of hierarchical relative placement groups that instantiate specified groups.

SYNTAX

```
collection all_rp_instantiations
[rp_groups]
```

Data Types

rp_groups list or collection

ARGUMENTS

rp_groups
Specifies the instantiated relative placement groups whose parent groups are to be included in the collection returned by this command.
If you do not specify this argument, this command returns a collection containing all hierarchical relative placement groups in the design that contain instantiated groups.

DESCRIPTION

The **all_rp_instantiations** command returns a collection of hierarchical relative placement groups that instantiate the groups specified in *rp_groups*. If you do not specify *rp_groups*, this command returns a collection containing all hierarchical relative placement groups currently in memory that instantiate other relative placement groups. This command is supported only for designs that do not contain multiply-instantiated designs.

If no relative placement groups are found, the command returns an empty string.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **all_rp_instantiations** command:

```
prompt> get_rp_groups
{mul::grp_mul ripple::grp_ripple example3::top_group}

prompt> all_rp_instantiations
{ripple::grp_ripple example3::top_group}
```

```
prompt> all_rp_instantiations ripple::grp_ripple  
{example3::top_group}  
  
prompt> remove_rp_groups -all -quiet  
1  
  
prompt> all_rp_instantiations
```

all_rp_references

Returns a collection of relative placement groups that directly contain the specified cells, which are either leaf cells or hierarchical cells that contain instantiated relative placement groups.

SYNTAX

```
collection all_rp_references
[cell_list]
[-design design_name]
```

Data Types

<i>cell_list</i>	list
<i>design_name</i>	design

ARGUMENTS

cell_list

Specifies the cells (either leaf cells or hierarchical cells that contain instantiated relative placement groups) whose parent groups are to be included in the collection returned by this command.
If you do not specify this argument, this command returns a collection containing all relative placement groups that directly contain any leaf cells in the specified design.

-design design_name

Specifies the design in which to locate the specified cells.
If you do not specify this option, the tool looks for the cells in the current design.

DESCRIPTION

The **all_rp_references** command returns a collection of relative placement groups that directly contain the cells (either leaf cells or hierarchical cells that contain instantiated relative placement groups) specified in *cell_list*. This command is supported only for designs that do not contain multiply-instantiated designs.

If you do not specify *cell_list*, the command returns a collection containing all relative placement groups that directly contain any leaf cells in the specified design.

A group directly contains a leaf cell if the cell was added to the group using the **-leaf** option of the **add_to_rp_group** command.

A group directly contains a hierarchical cell if the cell was used to hierarchically instantiate another group using the **-instance** option the **add_to_rp_group** command.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **all_rp_references** command:

```
prompt> get_rp_groups
{mul::grp_mul ripple::grp_ripple example3::ripple
example3::top_group}

prompt> all_rp_references
{mul::grp_mul ripple::grp_ripple example3::ripple}

prompt> all_rp_references U1 -design mul
{mul::grp_mul}

prompt> remove_rp_groups -all -quiet
1

prompt> all_rp_references
```

all_scenarios

Lists all defined scenarios available in memory.

SYNTAX

```
string all_scenarios
```

ARGUMENTS

The **all_scenarios** command has no arguments.

DESCRIPTION

Displays the scenarios currently defined in memory. This list includes both active and inactive scenarios.

Multicorner-Multimode Support

This command uses information from both active and inactive scenarios.

EXAMPLES

The following example uses **all_scenario** to list the available scenarios.

```
prompt> create_scenario MODE1
prompt> create_scenario MODE2
prompt> all_scenarios
MODE1 MODE2
```

SEE ALSO

```
all_active_scenarios(2)
set_active_scenarios(2)
current_scenario(2)
remove_scenario(2)
create_scenario(2)
```

all_size_only_cells

Returns the collection of cells that have been specified size_only attribute on them.

SYNTAX

```
collection all_size_only_cells  
cell_list
```

Data Types

cell_list list

ARGUMENTS

cell_list

Specifies the list of cells, from which size_only cells are returned. This can be a simple list or it can be an entire collection manipulation command, enclosed in square brackets [], that returns a collection of cells. By default, all cells in the design are considered.

DESCRIPTION

This command returns the collection of size only cells from the specified cell list. You can use wild cards, such as an asterisk (*) or question mark (?), when specifying the input cell list.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection handle.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

```
prompt> all_size_only_cells  
{ "U20", "U21", "U23", "SBLK/U1", "SBLK/U2" }
```

Following example shows the returned collection of size only cells in the *SBLK* subdesign. In this case, the command returns the collection specified by the **get_cells** command operating on *SBLK*.

```
prompt> all_size_only_cells [get_cells SBLK/*]  
{ "SBLK/U1", "SBLK/U2" }
```

SEE ALSO

`set_size_only(2)`
`get_attribute(2)`
`foreach_in_collection(2)`
`get_cells(2)`
`set_attribute(2)`
`report_attribute(2)`
`sizeof_collection(2)`

all_spare_cells

Returns a collection of all spare cells in the design or from a list of objects in the input collection.

SYNTAX

```
collection all_spare_cells
[input_coll]
```

Data Types

input_coll collection

ARGUMENTS

input_coll

Specifies the input collection to search and return the collection of spare cells. Objects are to be searched only from the content of the specified input collection, rather than from the design.

DESCRIPTION

The **all_spare_cells** command returns the collection of all spare cells in the entire design hierarchy (not just those in the top level of the design).

If you specify a value for the *input_coll* option, the tool searches for spare cells only in the collection this option identifies, rather than in the entire design.

The **all_spare_cells** command looks for an internal attribute placed earlier on existing cells during physical optimization or on additional cells at the end of physical optimization. (For more information, see the man page for the **insert_spare_cell** command.)

The tool returns a standard Tcl-language collection. You can perform all of the generic-collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection of all spare cells in the design.

```
prompt> all_spare_cells
{spare1 top/spare2 top/spare4 spare10}
```

The following example returns a collection of all spare cells from an existing

collection stored in \$COLL.

```
prompt> all_spare_cells $COLL
{spare1 spare2}
```

SEE ALSO

```
foreach_in_collection(2)
sizeof_collection(2)
```

all_threestate

Returns a collection of threestate cells or nets.

SYNTAX

```
collection all_threestate
-nets
[input_coll]
```

Data Types

input_coll collection

ARGUMENTS

-nets

Specifies that the collection of threestate nets is to be returned.

input_coll

Search the specified input collection and return a collection of threestate nets. Objects are to be searched only from the the content of the specified input collection rather than from the design.

DESCRIPTION

This command can return a collection of all threestate nets from the design. The tool searches the entire design hierarchy. It returns threestate nets from the entire design, not just from the top level.

If you specify a value for *input_coll*, the command searches for threestate nets only from the specified collection, rather than from the entire design.

Only those nets are returned as three state, which are driven by a pin which is tri-state or bi-directional.

If you do not specify the **-nets** option, the **all_threestate** command returns an error.

A standard Tcl collection is returned. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection handle.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection of all threestate nets from the design.

```
prompt> all_threestate -nets
{ii2/hin iv3/in iv3/out tin ii2/hout tout}
```

SEE ALSO

`all_fanout(2)`
`foreach_in_collection(2)`
`sizeof_collection(2)`

all_tieoff_cells

Returns a collection of all tie-off cells in the current design or in the input collection.

SYNTAX

```
collection all_tieoff_cells
```

ARGUMENTS

The **all_tieoff_cells** command has no arguments.

DESCRIPTION

This command returns a collection of all tie-off cells from the current design. The tool searches the entire design hierarchy. It returns tie-off cells from the entire design, not just from the top level.

Tie-off cells are the constant cells that the tool introduced in the design. To find the value of a tie-off cell, the tool examines the corresponding lib_cell of each cell to determine if it is logic-0 or logic-1.

If you specify a value for *input_coll*, the command searches for tie-off cells or nets only from the specified collection, rather than from the entire design.

This command returns a standard Tcl collection. All of the generic collection manipulating commands, such as **foreach_in_collection**, **sizeof_collection**, and so on, can be performed on this collection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection of all tie-off cells from the design.

```
prompt> all_tieoff_cells
{logic1 logic0}
```

The following example returns a collection of all tie-off cells from an existing collection stored in \$COLL.

```
prompt> all_tieoff_cells $COLL
{logic1}
```

SEE ALSO

`foreach_in_collection(2)`

sizeof_collection(2)

allocate_fp_budgets

Performs proportional timing budgeting.

SYNTAX

```
allocate_fp_budgets
[-black_box_cells bb_cells_list]
[-fixed_delay_objects objects]
[-file_format_spec file_format_string]
[-no_interblock_logic]
[-cells budget_cell_names]
[-incremental]
[-advanced]
[-no_split]
[-create_qtm_models [-qtm_model_path output_directory]]
```

Data Types

<i>bb_cells_list</i>	list
<i>objects</i>	collection
<i>file_format_string</i>	string
<i>budget_cell_names</i>	list
<i>output_directory</i>	string

ARGUMENTS

```
-black_box_cells bb_cells_list
    Specifies a list of black box cells to budget. The cells should have a timing
    model. By default, none of the black box cells are rebudgeted.

-fixed_delay_objects objects
    Specifies a collection of objects that are implemented and their related
    delays will not change. The objects can include one or more of:soft macro
    cells, hard macro cells, black box cells, hierarchical cells for plan groups,
    pins of soft macros with ILMs, and pins of hierarchical cells for plan groups.
    The budgets allocated to them are equal to the current delay. By default,
    there are no fixed delay objects.

-file_format_spec file_format_string
    Specifies the directory and naming style of the resulting Synopsys Design
    Constraints (SDC) files.

-no_interblock_logic
    Specifies that the top-level delays are considered fixed. There is no
    proportional budget allocation at the top level.

-cells budget_cell_names
    Specifies a list of budget cell names. By default, all plan groups and soft
    macros in the current design are budgeted.

-incremental
    Performs budgeting in incremental mode. In incremental mode, budgeting
```

retrieves certain block implementation information from the ILMs of soft macros and budgets the delays using this information.

-advanced

Specifies that budgeting is to be based on virtual in-place optimization (IPO).

-no_split

Do not split long lines. By default, SDC files created by the budgeter split long lines by using a backslash () symbol at the end of each line.

-create_qtm_models

Creates quick timing models (QTM) for the plan groups or soft macros that are budgeted. The delay arcs and the constraint arcs in the generated QTM represent the budgets on the plan groups or soft macros. You can load the QTMs for the soft macros or plan groups after they are committed to soft macros, to check timing at the top level and to verify the budgets.

By default, quick timing models are not created.

-qtm_model_path output_directory

Specifies the path to write the quick timing model (QTM) files that are generated by the tool.

By default, the files are written to the current work directory. This option takes effect only when the **-create_qtm_models** option is specified.

DESCRIPTION

This command performs proportional timing budgeting for all plan groups or soft macros in the design. It prints out Synopsys Design Constraints (SDC) files, which contain timing constraints describing the budgets.

By default, the **allocate_fp_budgets** command disables recovery and removal arcs in a way that is similar to that of the **report_timing** and timing optimization commands. To enable recovery and removal arcs, set the **enable_recovery_removal_arcs** variable to true. This variable setting is honored by the **allocate_fp_budgets** command, the **report_timing** command, and the timing optimization commands, such as **place_opt**.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example performs timing budgeting for a design with three blocks named BlockA, BlockB, and BlockC. It creates three SDC files in the current directory, named BlockA.sdc, BlockB.sdc, and BlockC.sdc, which contain the timing constraints for the corresponding block.

```
prompt> allocate_fp_budgets
```

The following example creates three files named BlockA.sdc, BlockB.sdc, and

BlockC.sdc. In this case, the delay internal to the file named BlockA.sdc is considered to be fixed. This potentially affects all three generated files.

```
prompt> allocate_fp_budgets -fixed_delay_objects [get_cells BlockA]
```

report_timing(2)
enable_recovery_removal_arcs(3)
```

analyze_fp_rail

Analyzes a complete or partial power network for voltage (IR) drop and electromigration (EM) on the specified power and ground nets.

SYNTAX

```
status analyze_fp_rail
-nets nets
[-power_budget power]
[-analyze_power]
[-voltage_supply voltage]
[-pad_masters pad_masters]
[-read_pad_instance_file file_name]
[-read_pad_master_file file_name]
[-use_pins_as_pads]
[-top_level_only]
[-create_virtual_rails layer]
[-ignore_blockages]
[-ignore_conn_view_layers layer]
[-read_power_compiler_file file_name]
[-read_prime_power_file file_name]
[-read_default_power_file file_name]
[-output_directory directory_name]
```

Data Types

<i>nets</i>	collection or list
<i>power</i>	float
<i>voltage</i>	float
<i>pad_masters</i>	string
<i>file_name</i>	string
<i>layer</i>	collection or list
<i>directory_name</i>	string

ARGUMENTS

-nets *nets*
Specifies the names of the power or ground nets on which to perform power network analysis. The default is to perform it on all power and ground nets.

-power_budget *power*
Specifies a total power budget for the analyzed design on which to perform constraint-driven power network analysis. The power budget is divided among the instances according to their sizes. For hard macros or standard cells, the power budget is computed based on the percentage of the total area. For a hierarchical block, the it is computed based on the sum of all cells and blocks inside it. The power unit is in milliwatts. The default is **1000**. For example, if the power budget for the entire design is 500 milliwatts, the total area of the top-level blocks is 500,000 square microns, and one of the blocks has an area of 25,000 square microns, power network analysis allocates the power for that 25,000-square-micron block as follows:

500mW * (25,000/50,000) = 25mW

-analyze_power

Specifies the power network analysis|synthesis (PNA|PNS) engine to analyze power for each instance from ICC. Before using this tcl option for power analysis, the default toggle rate (default as 0.1) and default static probability (default 0.5) for primary inputs and black box outputs can be set using **set power_default_toggle_rate** and **set power_default_static_probability** commands. The toggle rate and/or static probability for a specified object, e.g. a net, pin or port can be set using **set_switching_activity**. The switching activity interchange format (SAIF) file may also be read using **read_saif** command. **set_cell_internal_power** can be used to set the power value of a pin per toggle. Please refer to **report_power** command for more detailed information. **report_power -cell -flat -nosplit** is recommended to be run first prior to PNA with **-analyze_power**.

-analyze_power can be used concurrently with option **-power_budget**. If a power budget is specified using **-power_budget** together with **-analyze_power** and the power budget is larger than the sum of instance power calculated by **-analyze_power**, the difference between power budget and the total power by **-analyze_power** will be assigned to those instances that are not assigned in **-analyze_power** if there is any such instances. Otherwise, the power budget is ignored. Power budget is set to 0 by default with "**-analyze_power**".

-analyze_power can also be used concurrently with **-read_default_power_file**. The power specified in the default power file has a higher priority than that calculated by **-analyze_power** option, i.e. if the power value is calculated and read from the default power file for one instance, the instance will be assigned with the power from the default power file.

"**-analyze_power**" is mutually exclusive with "**-read_power_compiler_file**" and "**-read_prime_power_file**".

By default, power is NOT calculated from ICC unless this option is explicitly used.

-voltage_supply voltage

Specifies at the power pad the voltage of the net to be analyzed. The voltage unit is volts. The default is **1.5**.

-pad_masters pad_masters

Specifies the pad masters and the associated net as follows

net_name:pad_master_name

If net name is not specified, the pad master is used for both power and ground nets. By default, PNA will assume all the pads logically connected to signal **1** or **0** as power pads.

-read_pad_instance_file file_name

Specifies the pad instance file name and (optionally) the net name. If you do not specify the net name, the command assumes that the specified pad instance is used for both power and ground nets.

The *instance_and_net* format is as follows:

instance_name [net_name]

For example, a valid *instance_and_net* value might be **VDD1 VDD**. By default, this option is off.

-read_pad_master_file file_name

Specifies the pad master file name and (optionally) the net name. If you do

not specify the net name, the command assumes that the specified pad master is used for both power and ground nets. The *master_name_and_net* format is as follows:

master_name [net_name]

For example, a valid *master_name_and_net* value might be **VDD.FRAM VDD**. By default, this option is off.

-use_pins_as_pads

Specifies to regard pins as pads in block level simulation.

-top_level_only

Specifies for the power network analysis (PNA) engine to ignore cells inside soft macros, but to consider all the power and ground net wires and vias in the design. By default, the PNA engine analyzes the design as if it were flat.

-create_virtual_rails layer

Allows Power network analysis to create virtual pseudo straps that represent the metal 1 straps for the standard cell pin connections because, during floorplanning stages, metal 1 straps for the standard cell pin connections usually are not available. During power planning, Power network analysis then analyzes the IR (voltage) drop and electromigration to predict what the effects might be when the metal 1 straps are available. This option creates pseudo horizontal straps with specified layers for standard cell pin connections based on the row information in the database. By default, this option is off.

-ignore_blockages

Ignores blockages for virtual pads.

By default, this option is off.

-ignore_conn_view_layers layer

Ignores all metal layers (select the All option) or the specified metal layer(s) (select the Specified option) in connectivity (.CONN) views. By default, this option is off and none of metal layers are ignored.

-read_power_compiler_file file_name

Obtains the power calculation source from a Power Compiler report file. By default, this option is off.

-read_prime_power_file file_name

Obtains the power calculation source from a Prime Power/Prime Time PX report file. By default, this option is off.

-read_default_power_file file_name

Uses the PNA default format to obtain a power calculation. The *power_name_and_value* format is as follows, where *power_value* is given in mW:
instance_or_master_name [power_value]

For example, a valid *power_name_and_value* value might be as follows:

instance X1 0.2

master abc.FRAM 0.1

By default, the command also reads a power information file generated from AstroRail by using the **poDumpPowerInfo** command.

```
-output_directory directory_name
    The specified directory stores the IR/EM results with the file name
    design_name.net_name.pw_hl.pna and the power allocation results with the
    file name design_name.net_name.power. The default is pna_output.
```

DESCRIPTION

This command allows user to perform a power network analysis (PNA) in a complete or partially built power/ground network at design planning stage. If the power ports in standard cells and/or hard macros are yet to be connected to the P/G network, the PNA will make virtual connection to those unconnected power ports and analyze the IR drop and EM in the power network based on user provided power budget and voltage supply.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example shows how to analyze the voltage drop on net *VDD* and *VSS* in the power network. The total power budget in the design is 1000mW, the voltage supply is 1.2V, and the pad master is *pvdi.FRAM* for net *VDD* and *pvdo.FRAM* for net *VSS*.

```
prompt> analyze_fp_rail\
-nets {VDD VSS}\
-power_budget 1000\
-voltage_supply 1.2\
-pad_masters "VDD:pvdi.FRAM VSS:pvdo.FRAM"
```

The following example shows how to analyze the voltage drop on net *VDD* in the power network. The power is analyzed by ICC and the voltage supply is 1.2V.

```
prompt> analyze_fp_rail\
-nets VDD\
-analyze_power\
-voltage_supply 1.2
```

SEE ALSO

create_fp_virtual_pad(2)
load_fp_rail_map(2)
```

analyze_fp_routing

Analyzes the existing global routing to determine where nets cross plan groups or voltage areas boundaries. Creates feedthroughs on plan groups or on hierarchical modules that belong to voltage areas. In the case of plan groups, records the location, level, and direction of the pins (including feedthrough pins) that are implied by the routing.

SYNTAX

```
int analyze_fp_routing
[-output_feedthrough_nets {plan_groups | voltage_areas}
[-finalize_pins_feedthroughs {plan_groups | voltage_areas}]
[-include_flip_chip_style_connections]
```

ARGUMENTS

-output_feedthrough_nets {plan_groups | voltage_areas}

This option causes `analyze_fp_routing` to output a list of feedthrough nets to the specified file. It will list feedthrough nets on plan groups if "plan_groups" option is selected and list feedthrough nets on voltage area if "voltage_areas" option is selected. No changes are made to the database. This option is intended to preview the nets whose routing implies feedthroughs on plan groups or voltage areas. It may be run prior to running `analyze_fp_routing` with the "-finalize_pins_feedthroughs" option to see which nets will have feedthrough ports created within them. If run AFTER running -finalize_pins_feedthroughs, it will also list the feedthrough nets. Note that this command lists the names of the nets that will contain feedthroughs, not the names of the feedthrough ports, which may not yet have been created.

-finalize_pins_feedthroughs {plan_groups | voltage_areas}

This option causes `analyze_fp_routing` to insert feedthroughs into the logical hierarchy based on the existing global routing. If the "plan_groups" option is selected, pin locations for each crossing with a plan group are also calculated and saved. If the "voltage_areas" option is selected, then feedthrough nets and ports are created for nets that have routing crossing a voltage area. For the "voltage_areas" option, if the routing crosses a plan group which also belongs to a voltage area, the feedthrough will be created on that plan group; otherwise, it will select a hierarchical module within this voltage area and create a feedthrough on it. A voltage area need not correspond to a single hierarchy module. If a voltage area corresponds to more than one hierarchical modules, this command will create feedthroughs on the hierarchical modules which has connection to the processing net. Note that for "voltage_areas" only logical feedthrough nets and ports are created. The physical location of the boundary crossing is not recorded. Those logical feedthrough ports are listed in a text file "VA_Feedthroughs.port" under current directory.

These two options can be combined if you want to create feedthroughs on both plan groups and voltage areas in one run.

-include_flip_chip_style_connections

This option specifies that the command also processes the nets that are

connected to top level flip-chip bump pins or IO pins that are overlapped with voltage area/plan groups. It will create feedthrough nets/ports as needed for those nets. The default behavior of `analyze_fp_routing` doesn't process the nets that are connected to flip-chip bump pins or the top level terminals that are overlapped with voltage areas/plan groups.

DESCRIPTION

Use this command to analyze the global routing with respect to crossings of plan groups or voltage areas. This information can be used to output a list of the feedthrough nets on plan groups and/or voltage areas. It can update the database by inserting feedthroughs into the logical hierarchy where plan group crossings do not have corresponding connections in hierarchy preservation and by saving the position of each boundary crossing as a guide to pin placement later. It can also update the database by inserting feedthroughs into hierarchical modules that belong to voltage areas when the router runs across a voltage area.

The pin locations on plan groups are used later during commit to generate a pin placement. Inserted feedthroughs on voltage areas can be used during buffer insertion to optimize timing.

The behavior of this command depends on pin constraints set previously with `set_fp_pin_constraints` and upon voltage area constraints set previously with `set_fp_voltage_area_constraints`. It also depends on the last global route (and the pin/voltage area constraints which controlled that global route). The nets that this command analyzes can be limited by a prior run of `set_fp_pin_constraints` and `set_fp_voltage_area_constraints`. If `set_fp_pin_constraints` or `set_fp_voltage_area_constraints` was called prior to running this command, and it specified a limited set of nets, then this command will analyze those nets only, and it will do it based upon the state of the last global route.

Use `--output_feedthrough_nets` to preview the nets that would have feedthroughs created within them. Use the commands `set_fp_pin_constraints` and (or) `set_fp_voltage_area_constraints` to include/exclude those "previewed" nets and insert feedthroughs on the included nets with `--finalize_pins_feedthroughs` option.

The following example creates feedthroughs on plan groups as necessary and creates pin locations for plan groups for later pin assignment during commit. It also creates feedthroughs on hierarchical modules that belong to voltage areas if needed so that later buffer insertion can be done on those feedthroughs within the voltage areas.

```
prompt> analyze_fp_routing --finalize_pins_feedthroughs {plan_groups | voltage_areas}
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

`set_fp_pin_constraints(2)`
`set_fp_voltage_area_constraints(2)`

analyze_rail

Performs the targeted rail analyses on the specified nets. This command generates data needed to run PrimeRail and constructs a script that runs PrimeRail within the IC Compiler session. This command enables three target analyses: power and ground network integrity analysis, voltage drop analysis, and electromigration analysis. A previously generated PrimeRail command script can also be used to drive the rail analysis.

SYNTAX

```
status analyze_rail
nets
[-integrity]
[-voltage_drop]
[-electromigration]
[-primerail_script_file pr_script]
[-script_only]
```

Data Types

<i>nets</i>	collection or list
<i>pr_script</i>	string

ARGUMENTS

nets

Specifies the names of the power and ground nets to be analyzed. When not specified, this command returns an error.

-integrity

Performs connectivity checking on the specified power and ground nets. When enabled, the power and ground network integrity will be reported in a Milkyway error view and resistivity map data will be generated.

-voltage_drop

Performs voltage drop analysis on the specified power and ground nets. When enabled, voltage drop map data will be generated and voltage drop violations will be reported in the Milkyway error view.

By default, the command performs voltage drop analysis if no specific analysis type is specified.

-electromigration

Performs electromigration analysis on the specified power and ground nets. When enabled, electromigration map data will be generated and electromigration violations will be reported in the Milkyway error view.

-primerail_script_file *pr_script*

Specifies and uses an existing PrimeRail script to perform the PrimeRail run. This script generally is generated from an earlier **analyze_rail** run. When a user-specified script file is used, all the other currently enabled options will become disabled. For example, executing **analyze_rail -voltage_drop -primerail_script_file myscript.cmd** disables the **-voltage_drop**

option.

-script_only
Generates the PrimeRail script for the target analyses, such as integrity, voltage drop or electromigration, without actually executing the analysis run. This allows the user to modify and re-use the run script as desired. This switch cannot be used in conjunction with the **-primerail_script_file** option.

DESCRIPTION

The command prepares the data needed for a PrimeRail rail analysis, and then calls PrimeRail to perform the rail analysis run. By default, the command performs voltage drop analysis on the specified power and ground nets. PrimeRail generates map data files that can be viewed to analyze the results. These map files are saved to the */output_dir/rail_map_data/current_mw_cell_net_name* directory at the end of the run. PrimeRail also generates an error view that documents issues found during the run. Display the errors in the error browser, depending upon the analysis options chosen.

Power and ground network integrity analysis checks for missing vias, insufficient vias, pin connections, and other related power and ground integrity, and saves the identified issues into the Milkyway error view. This analysis also calculates the minimum path resistivity on the target power and ground nets and saves the results into the map data files that can be viewed via the resistivity map.

Voltage drop analysis analyzes the voltage drop of the specified power and ground nets and saves the results into the map data files that can be viewed via the voltage drop map. If a voltage drop threshold has been set with the **set_rail_options** command, threshold violations will be reported to the error view.

Electromigration analysis calculates current density or pin currents and saves the results into the map data files that can be viewed via the electromigration map. The electromigration analysis also calculates the electromigration violations based on the default rules that are currently loaded in Milkyway. The violations are saved to Milkyway error view.

You can choose to perform more than one target analyses, such as resistivity and voltage drop, in a single run.

EXAMPLE

The following example performs the voltage drop analysis:

```
prompt> set_rail_options -default  
prompt> analyze_rail {VDD VDDV}
```

The following example performs power and ground network integrity analysis:

```
prompt> set_rail_options -user_defined_taps VDD_tap.txt  
prompt> analyze_rail VDD -integrity
```

The following example performs power and ground network integrity analysis and

voltage drop analysis:

```
prompt> analyze_rail {VDD VSS} -integrity -voltage_drop
```

[-starrcxt_map_file file_name]
[-configuration list_of_scenario_configurations]
[-output_directory directory]
[-input_rise_transition transition_time]
[-input_fall_transition transition_time]
[-period pulse_duration]
[-clock clock_name]
[-no_extraction]
[-from pins]
[-tie_high pins_or_nets]
[-tie_low pins_or_nets]
[-zero_resistance nets]
[-reset_annotation]
[-purge_all_annotations]
[-projected_loads load_configuration]
[-projected_drivers driver_configuration]
[-projected_input_skew input_skew_configuration]
[-probe_wires net]
[-verbose]
[-starrcxt_nxtgrd_file ]
```

Data Types

<i>string</i>	<i>name_of_simulator</i>
<i>net_or_pins</i>	collection of one net or multiple pins
<i>name_of_simulator</i>	<i>string</i>
<i>list_of_files</i>	<i>list</i>
<i>list_of_scenario_configurations</i>	<i>list</i>
<i>directory</i>	<i>path</i>
<i>transition_time</i>	float > 0.0
<i>clock_name</i>	<i>string</i>
<i>pins</i>	collection
<i>pins_or_nets</i>	collection
<i>nets</i>	collection
<i>load_configuration</i>	<i>list</i>
<i>driver_configuration</i>	<i>list</i>
<i>input_skew_configuration</i>	<i>list</i>

ARGUMENTS

-name string

Specifies the name of this subcircuit, which is used to distinguish it from other subcircuits in the same design. The string is used to construct both circuit elements and file names, so it must only contain alphanumeric characters and underscores. With that restriction, you can use any name, but if a clock is being analyzed you should use the name of the clock (if this is unique). Many files are generated based on this name.

-to net_or_pins

Specifies a collection of input pins that are driven by the circuit. If you specify a single net, the input pins associated with the net are included as load pins. (In earlier releases, the option was known as **-load**.)

-analysis_mode max | min | max_then_min

Specifies how buffer delays are calculated. If set to max, the delays for the buffers are calculated using their maximum delay value. If set to min, their minimum delay value is used. If set to max_then_min, maximum analysis is performed, followed by minimum analysis. You can use this option only if the TLUPPlus specifies two corners.

-effort low | medium | high

Specifies the precision of the analysis done by the simulator. The effort setting is reformatted to suit the input syntax of the circuit simulator and sent as a parameter to the circuit simulation engine to control the precision of its analysis. The default is low.

-simulator name_of_simulator

Specifies which simulator to use. Only HSIM and NanoSim simulators are supported. The default is NanoSim.

-spice_header_files list_of_files

Specifies the locations of the spice device models of the transistors. Spice device models are needed for all the transistors. You specify the device models with the file path, and the file paths are copied into the simulator input. If you specify multiple files, they are included in the order specified. Note that file locations are relative to the current working directory (not relative to the temporary working directory, as was done in some earlier versions of mesh analysis).

-driver_subckt_files list_of_files

Specifies the locations of the subcircuit models of the buffers in the clock mesh tree. The circuit simulator requires a subcircuit model for all the buffers in the clock mesh tree. You specify the subcircuit models with the file path, and the file paths are copied into the simulator input. If you specify multiple files, they are included in the order specified. Note that file locations are relative to the current working directory.

-starrcxt_map_file file_name

Specifies the file name that contains the physical layer mapping information between the input database and the nxtgrd file. This file maps every TCAD process layer to a corresponding layer of layout database. This is a mandatory option if you want to use Star-RCXT for extraction.

```

-configuration list_of_scenario_configurations
    Specifies the SPICE settings for each scenario to be analyzed. The list can
    be of any length.
    The format of the list_of_scenario_configurations argument is
        -configuration {
            {-scenario_name scenario
                [-max_driver_subckt_files max_files]
                [-max_spice_header_files header_max]
                [-min_driver_subckt_files min_files]
                [-min_spice_header_files header_min]
            } ...
        }
    The -scenario_name option is a required option and the specified name must
    be the same as the name used in the create_scenario command that created the
    scenario.
    If you do not specify the -max_driver_subckt_files or -
    min_driver_subckt_files option for a scenario, that scenario uses the files
    specified in the -driver_subckt_files command option. If you do not specify
    the -max_spice_header_files or -min_spice_header_files option for a
    scenario, that scenario uses the files specified in the -spice_header_files
    command option.

-output_directory directory
    Specifies the directory used to contain the simulation driving files and the
    results of the simulation. If you do not specify this option, the -name option
    is used for the name of the output directory. If no directory by this name
    exists, one is created. Because many files are created in this directory, you
    must specify a directory with write permissions and sufficient disk space.

-input_rise_transition transition_time
    Specifies the rise transition time for the root of the subcircuit. This value
    must be greater than zero. The parameter overrides any rise transition time
    otherwise observable in the circuit.
    If you do not specify this option, the tool considers all the clocks found
    at the root of the subcircuit, and uses the slowest rise transition time.

transition_time
    Specifies the fall transition time for the root of the subcircuit. This value
    must be greater than zero. The parameter overrides any fall transition time
    otherwise observable in the circuit.
    If you do not specify this option, the tool considers all the clocks found
    at the root of the subcircuit, and uses the slowest fall transition time.

-period pulse_duration
    Controls the waveform (width of the pulse) applied at the root node. This
    value must be greater than zero.
    If you do not specify this option, the tool uses a pulse with half the width
    of the relevant clock period. In general, you should not have to change this
    option.

-clock clock_name
    Specifies for which clock domain the analysis should be done. This especially
    helps to select the appropriate clock path when multiple clocks arrive at
    pins of a cell in the clock mesh circuitry.

```

-no_extraction
Controls whether the tool runs the **extract_rc** command to extract parasitics before writing the simulation driving files.
By default, the tool runs the **extract_rc** command. If your design already has current parasitic information written in the output directory from a previous run, you can suppress extraction to save time.

-from pins
Specifies the startpoint to analyze a circuit.
If you do not specify this option, the command automatically determines a single driving point of a clock tree based on the load of the clock tree. If you design the tree from the loads up, specify the pins to be driven for timing purposes. You must specify this option if you are analyzing circuits with complex cells such as AND gates, multiplexers, and integrated clock-gating (ICG) cells. (In earlier releases, This option was known as **-inputs**.)

-tie_high pins_or_nets
Holds the specified nets (or the nets attached to the specified pins) at logic one during simulation. If you specify a net, it is equivalent to specifying all the pins on that net.
This option is for advanced users only and might be useful for enable pins.

-tie_low pins_or_nets
Holds the specified nets (or the nets attached to the specified pins) at logic zero during simulation. If you specify a net, it is equivalent to specifying all the pins on that net.
This option is for advanced users only and might be useful for disable pins.

-zero_resistance nets
Sets the wire resistance for the specified nets to zero to perform "what if" analysis.
This option is for advanced users and can be used to estimate the amount of skew that has been introduced by wire resistance.

-reset_annotation
Removes the mesh timing annotation data from the previous **analyze_subcircuit** session from a single net.
You must use this option together with the **-to** option.

-purge_all_annotations
Removes the mesh timing annotation data from the previous **analyze_subcircuit** session from the entire design.

-projected_loads load_configuration
Specifies additional loads that are to be included in the simulation in accordance with the configuration list. The configuration list defines projected load groups that are included in the simulation. You can define any number of projected load groups in the configuration list.
The format of the projected loads configuration list is

```

-projected_loads {
    {-within rectangle
        [-capacitance capacitance_value]
        [-load_pin library_pin -number_of_loads positive_integer]
        [-load_wire_capacitance capacitance_value]
    }...
}
```

```

}

The -within option is required for each projected load group. It defines the mesh elements to which additional capacitance is added. Only mesh elements within the specified rectangle are in the load group.
You can specify the additional capacitance in the following ways:
* Use the -capacitance option to specify a capacitance value.
  This value is added to all mesh elements in the load group.

* Use the -load_pin option to specify a load pin.
  This is typically the name of a buffer or an integrated clock-gating cell (ICG). The tool multiplies the capacitance attribute of the specified pin by the value of the -number_of_loads option and adds this value to all mesh elements in the load group. The -number_of_loads option estimates the number of integrated clock-gating cells (ICGs) and buffer loads found within the specified region.

* Use the -load_wire_capacitance option to specify a small capacitance value that is added to the value associated with each load pin to model the comb routing to the pin.
The specified capacitance is added to the load pin capacitance, which is calculated by adding the load pin capacitance to the wire capacitance times the number of loads. This capacitance is modeled as being distributed uniformly over the mesh straps in the specified region.
If you specify multiple projected load region statements, their effect is cumulative. That is, the capacitance at a point is impacted by the sum of all the projected load statements that overlap it.
When constructing the projected groups configuration for a hierarchical design, you can get the bounding box of a cell or soft macro from its bbox attribute. You can get the capacitance of a library pin, for your own reference, from its capacitance attribute.
For example, you can define two projected load regions with this syntax:
analyze_subcircuit -name testc ... -projected_loads {
  {-within {{100.0 300.5} {800.0 440.6}}
   -capacitance 0.3e-12
   -load_pin tcbn90ghphvtwc/BUFFHVTD24
   -load_wire_cap 0.001e-12
   -number_of_loads 1000}
  {-within {{1900.0 2300.5} {3800.0 2440.6}}
   -load_pin tcbn90ghphvtwc/BUFFHVTD24
   -number_of_loads 1000}
}

-projected_drivers driver_configuration
Specifies additional drivers that are to be included in the simulation in accordance with the configuration list. The configuration list defines projected drivers that are included in the simulation. You can define any number of projected drivers in the configuration list.
To run analyze_subcircuit, your design must first have a mesh driver at each location where a driver might be needed. With this option, you can change the number and type of drivers seen by the simulation. This allows you to experiment with various drivers to get the set of drivers that is sufficient to drive your design reliably without overdriving the mesh and wasting power and area.
The configuration list defines the projected drivers that are included in the
```

simulation. You can define any number of projected drivers in the configuration list.

The format of the projected drivers configuration list is

```
-projected_drivers {  
    {-within rectangle | -nearest point  
     [-replicate integer]  
     [-projected_lib_cell lib_cell]  
    }...  
}
```

To identify the affected mesh drivers, you must specify either the **-within** option or **-nearest** option for each driver group. When you use the **-within** option, the specification affects the mesh drivers within the specified rectangle. When you use the **-nearest** option, the specification affects the mesh driver that is nearest to the specified point. The **-nearest** option might be effective for tuning the design based on the results of a previous analysis.

You can use the following options to specify additional drivers:

* **-replicate**

When you use this option, the simulation model includes the specified number of drivers in parallel for each affected mesh driver.

For example, if you specify **-replicate 4**, the SPICE simulation sees your original mesh driver plus three new ones in parallel. Note that these driver cells are not actually added to the design and they do not have locations or routing associated with them.

The only tool that sees them is the SPICE simulation.

You should not specify a value of 0. If you do, the SPICE simulation does not see the original cell; that is, part of the mesh that is not driven.

However, any routing parasitics associated with the comb route from its output pin are retained regardless of the value of this parameter. Because mesh drivers are typically close to the mesh and are therefore short and of low capacitance, this should not be a major inaccuracy.

* **-projected_lib_cell lib_cell**

When you use this option, the simulation uses the specified library cell instead of the actual mesh driver.

If you specify multiple projected driver groups and their geometric regions overlap on a driver, they are processed in the order they appear, and only the final one impacts the driver. This can be used to specify a projected driver for the entire design in one large region and to specify additional driver sizing in a series of small regions.

For example, you can define two projected driver groups with this syntax:

```
analyze_subcircuit -name testc ... -projected_drivers {  
    {-within {{100.0 300.5} {800.0 440.6}} -replicate 4}  
    {-within {{1900.0 2300.5} {3800.0 2440.6}}  
     -projected_lib_cell tcbn90ghphvtwc/BUFFHVTD24}  
}
```

-projected_input_skew input_skew_configuration

Specifies that simulation is to model skew on the input pins of the mesh drivers.

One of the major motivations for using a clock mesh is to reduce skew in the presence of on-chip variation (OCV) or other imperfections in a standard

clock tree. Because the premesh tree design flow generally produces a low-skew tree, to determine how effective the mesh would be at skew reduction is difficult. Because skew reduction is determined mainly by the width and pitch of the mesh, you are likely to create excess mesh straps unless you perform OCV analysis. You can use the **-projected_input_skew** option to calibrate the effectiveness of the mesh by simulating the effect of delay on the mesh driver inputs in one or more regions.

The worst case OCV probably occurs when a clock tree driver is close to the root of the premesh tree that has a very large additional delay, which might make half of what the chip sees as a large mesh driver input delay. If you consider this case too pessimistic, you might want to take only one quarter of the chip; that is, probably the quadrant with the largest load. Add delays to the mesh driver inputs in that quadrant by one typical gate delay.

The skew configuration list defines the delay to simulate on the mesh driver inputs in a region. You can define any number of input skew groups in the configuration list.

The format of the skew configuration list is

```
-projected_input_skew {
    {-within rectangle
        -rise_delay time
        -fall_delay time
        [-rise_transition time]
        [-fall_transition time]
    }...
}
```

The **-within** option is required for each input skew group. It defines the mesh drivers for which to model skew. Only mesh drivers within the specified rectangle are in the input skew group. If you specify multiple input skew groups, the specified geometric regions must not overlap.

You can specify the following delay values for each input skew group:

- * **-rise_delay**

Delays the input waveform for the rising edge by the specified time.
You must specify this value for each input skew group.

- * **-fall_delay**

Delays the input waveform for the falling edge by the specified time.
You must specify this value for each input skew group.

- * **-rise_transition**

Specifies the rising transition time for the input waveform.
If you do not specify this option, the simulation uses the rising transition time of the root of the tree.

- * **-fall_transition**

Specifies the falling transition time for the input waveform.
If you do not specify this option, the simulation uses the falling transition time of the root of the tree.

For example, if the mesh has an active area of 3000 by 4000 microns with the largest loads in the lower right quadrant and a gate delay is 0.025 ns, define the input skew group as follows:

```
analyze_subcircuit -name testc ... -projected_input_skew {
    {-within {{1500.0 0.0} {3000.0 2000}}
        -rise_delay 0.025 -fall_delay 0.020
        -rise_transition 0.1 -fall_transition 0.08}
}
```

-probe_wires net
 Specifies that extraction is to insert probe points at regular intervals along the wires of the specified net, which is typically a clock mesh net. You can specify only a single net. These probe points allow analysis to separate the skew on the mesh from the skew on the loads, which is typically larger and more random, so each can be addressed and minimized appropriately. Circuit performance in a clock mesh is determined by the efficacy of the drivers, mesh straps, and the routing from the mesh straps to the loads. Sometimes it is useful to distinguish between the delays and skew on the mesh straps and the skew induced by the comb routing to the load pins. The **-probe_wires** option causes the extraction to insert probe points along the long wires associated with the specified net. Short wires will not have probe points added. The spacing between probe points is determined by the tool. After simulation, the tool prints out a summary of the maximum, minimum, and average latency and transition times observed on these probe points. This summary might be useful for tuning the distribution of mesh drivers and adjusting the widths of the mesh straps. Only one net may be so instrumented. You can use this option only when you use Star-RCXT for extraction.

-verbose
 Displays the extraction and circuit simulation messages to the console. By default, these messages are redirected into log files in the output directory.

-starrcxt_nxtgrd_file
 Specifies the tcad grd file that contains conductor sheet resistance and models for 3-D parasitic capacitance calculation for Star-RCXT. This is a mandatory option if you want to use Star-RCXT for extraction. You need to specify one file for every scenario corner in the proper order in the list.

DESCRIPTION

Within IC Compiler, timing prediction is generally done with static timing analysis. But for some purposes, such as clock meshes, it is necessary or desirable to use circuit simulation. This command generates the necessary files to run a circuit simulator, invokes the simulator, and reads the output of simulation back into your design as annotations for delay and transition times.

By default, the **analyze_subcircuit** command extracts and simulates the circuit as it stands. You can also use this command to perform "what if" analysis to see how the mesh would behave with additional loads or different drivers. This is especially important in large hierarchical designs where the turnaround time of physical synthesis can be long and the need for upfront analysis is greater. For details about specifying additional loads, see the description for the **-projected_loads** option. For details about specifying additional drivers, see the description for the **-projected_drivers** option. For details about modeling input skew, see the description for the **-projected_input_skew** option.

FILES

Inputs required:

You must have a circuit-level model for each of the buffer gates in your clock tree,

analyze_subcircuit

150

and a transistor model for each of the transistors in the circuit models.

Files generated:

This command creates the *output* directory if it is not already present, and populates it with files for simulation and annotation. These include the circuit files, command files, and measurement files. One of these files is a shell script that is used to invoke the circuit simulator. Simulation produces many output and log files, which will also populate the directory. This command then processes those output files and generates an annotation file. This file can be sourced into your design, to update the delays and transition times of your subcircuit to match the circuit simulation results.

LIMITATIONS

The subcircuit to be analyzed is modeled as being by a single signal. That signal is applied at the unique point, determined automatically by traversing the circuit from the load pins, through any buffers, and stopping at an input port or a multiple input gate. The circuit to be simulated must not have any "side inputs." It does timing from one point to many.

If you want to analyze a set of mesh drivers whose inputs are not yet connected, you can do this by using the **-from** option and listing all the mesh driver input pins. For the purpose of simulation, these will all be driven in parallel, with no skew among them. This type of simulation is only for early exploration, before the clock tree "above" the mesh drivers has been designed.

Buffers that are "shorted together" in a mesh or other structure are supported. The resistance and capacitance of the mesh is determined by extraction, and is expressed in a parasitic input file with values obtained the IC Compiler extractor or Star-RCXT.

The entire subcircuit must be in the top level of the current Milkyway design. It must not extend into an ILM or subdesign.

The underlying circuit simulator is not case sensitive, so elements "buff_27" and "BUFF_27" are indistinguishable, and the design must not contain both names. For similar reasons, circuit elements should not contain the dot character "..".

NanoSim simulator will generally model coupling among the elements of the clock tree itself. The simulation of the tree accepts a transition time for the root gate. If the tree is driven by multiple clocks and the input signal has widely divergent transition times when operating in the various modes, this effect will not be modeled. The loads of the flip-flops are modeled by lump capacitance, not by active transistor models. If this operation is done before the signal nets have been routed, which would normally be the case, the final gate placement, routing geometry and detailed placement may not match the geometry in the final chip. There is no modeling of IR drop in the power or ground wires. The actual VSS and VDD used for each buffer gate is assumed to be static and is determined before simulation starts.

For more information on simulation refer to :

NanoSim User Guide
HSIM User Guide

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

In the following example, a clock tree called clk1 has been implemented with a set of specified library references to be used as buffers, driving a clock mesh net called mesh_net.

After this command has been run, the **report_timing** and **report_clock_tree** commands will reflect the delays and transitions observed in the circuit simulation.

```
prompt> analyze_subcircuit -name clk1 -to mesh_net \
    -output_directory clk_working \
    -spice_header_file original/models.sp \
    -driver_subckt_file {original/drivers.sp extra_cells.sp}
```

The following command uses HSIM simulator for analysis.

```
prompt> analyze_subcircuit -name clk1 -to mesh_net \
    -output_directory clk_working \
    -spice_header_file original/models.sp \
    -simulator hsim \
    -driver_subckt_file {original/drivers.sp extra_cells.sp}
```

In the following example, a clock tree called clk2 has been implemented with a set of specified library references used as buffers driving a set of pins, but not using a mesh net.

```
prompt> set load_pins \
    [get_pins {addr_reg[27]/CP S45_reg[6]/CP S47_reg[13]/CP \
    S37_reg[10]/CP}]
prompt> analyze_subcircuit -name addr -to $load_pins \
    -spice_header_file original/models.sp \
    -driver_subckt_file original/drivers.sp -effort high
```

If each scenario has a different SPICE file/header file, you should use **-configuration** as shown in the following example.

```
prompt> analyze_subcircuit -to clk \
    -driver_subckt_files max_spice_model \
    -spice_header_files header_file \
    -config {
        {-scenario_name scenario1
            -max_driver_subckt_files max_spice_model_1
            -max_spice_header_file max_header_file_1}
        {-scenario_name scenario2 -max_spice_header_file max_header_file_2}
    }
```

append_to_collection

Adds objects to the collection in the specified variable. The variable is updated.

SYNTAX

```
collection append_to_collection
var_name
object_spec
[-unique]
```

Data Types

<i>var_name</i>	collection
<i>object_spec</i>	list

ARGUMENTS

var_name

Specifies a variable name. The objects matching *object_spec* are added into the collection referenced by this variable.

object_spec

Specifies a list of named objects or collections to add.

-unique

Indicates that duplicate objects are to be removed from the resulting collection. By default, duplicate objects are not removed.

DESCRIPTION

The **append_to_collection** command allows you to add elements to a collection. This command treats the variable name given by *var_name* as a collection, and appends all of the elements in *object_spec* to that collection. If the variable does not exist, it is created as a collection with elements from *object_spec* as its value. If the variable does exist, and it does not contain a collection, it is an error.

The result of the command is the collection which was initially referenced by *var_name*, or the collection created if the variable did not exist.

The **append_to_collection** command provides the same semantics as a common use of **add_to_collection** but with significant improvement in performance. An example of replacing **add_to_collection** with **append_to_collection** is given below.

```
set var_name [add_to_collection $var_name $objs]
```

Using **add_to_collection** this becomes:

```
append_to_collection var_name $objs
```

The **append_to_collection** command can be much more efficient than **add_to_collection** if you are building up a collection in a loop. The arguments of the command have the same restrictions as the **add_to_collection** command. Please see the **add_to_collection** man page for more information about those restrictions.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example from IC Compiler shows how a collection can be built up with **append_to_collection**:

```
prompt> set xports
Error: can't read "xports": no such variable
      Use error_info for more info. (CMD-013)
prompt> append_to_collection xports [get_ports in*]
{"in0", "in1", "in2"}
prompt> append_to_collection xports CLOCK
{"in0", "in1", "in2", "CLOCK"}
```

SEE ALSO

```
add_to_collection(2)
foreach_in_collection(2)
index_collection(2)
remove_from_collection(2)
sizeof_collection(2)
```

apropos

Searches the command database for a pattern.

SYNTAX

```
string apropos
[-symbols_only]
pattern
```

Data Types

pattern string

ARGUMENTS

-symbols_only
 Searches only command and option names.

pattern
 Searches for the specified *pattern*

DESCRIPTION

The **apropos** command searches the command and option database for all commands that contain *pattern*. The *pattern* argument can include the wildcard characters "*" and "?". The search is case-sensitive. For each command that matches the search criteria, the command help is printed as though **help -verbose** was used with the command.

Whereas **help** looks only at command names, **apropos** looks at command names, the command one-line description, option names, and option value-help strings. The search can be restricted to only command and option names with the **-symbols_only** option.

When searching for dash options, do not include the leading dash. Search only for the name.

EXAMPLES

In the following example, assume that the **get_cells** and **get_designs** commands have the **-exact** option. Note that without the **-symbols_only** option, the first search picks up commands which have the string "exact" in the one-line description.

```
prompt> apropos exact
get_cells           # Create a collection of cells
      [-exact]        (Wildcards are considered as plain characters)
      patterns         (Match cell names against patterns)

get_designs        # Create a collection of designs
      [-exact]        (Wildcards are considered as plain characters)
      patterns         (Match design names against patterns)
```

```
real_time          # Return the exact time of day

prompt> apropos exact -symbols_only
get_cells          # Create a collection of cells
  [-exact]
    (Wildcards are considered as plain characters)
  patterns          (Match cell names against patterns)

get_designs        # Create a collection of designs
  [-exact]
    (Wildcards are considered as plain characters)
  patterns          (Match design names against patterns)
```

SEE ALSO

help(2)

archive_design

Archives the given design(s) to a new location.

SYNTAX

```
status archive_design
-source library_path
-design design_names
-archive archive_directory
[-complete]
[-overwrite]
```

Data Types

<i>library_path</i>	string
<i>design_names</i>	string
<i>archive_directory</i>	string

ARGUMENTS

```
-source library_path
    The path to the Milkyway library that contain the design(s) of interest.

-design design_names
    The Milkyway designs to archive. To archive multiple designs, enclose the
    design names in quotation marks delimited by the space character, ' '. To
    archive all designs in the main library, pass "*" as the argument. By default,
    the latest version of the design is archived, but a specific verison may be
    specified e.g., "top_design;3"

-archive archive_directory
    The location of the new archive directory.

-complete
    By default, archive_design takes a minimalistic approach and will only
    archive designs in reference libraries if they are needed by the design(s)
    being archived. If this option is used, even designs in referenced libraries
    that are not used will be copied over to the archive location. This allows
    the archived design to be further optimized later if needed.
```

DESCRIPTION

This command will copy the given Milkyway design, logic libraries, TLU+ files, and create a `design_setup.tcl` file in the given archive directory. The purpose is to extract one or more designs of interest from a library containing many designs, leaving you with a smaller, self-contained set of files for that design.

For the Milkyway design, `archive_design` will copy the latest version (unless otherwise specified) of all views of the design(s) being archived, and any subdesigns that are referenced directly or indirectly by these design(s). Note that the LM view is not archived. If `-complete` is specified, then all designs contained

in archived reference libraries will be copied. The main library and all needed reference libraries will each be placed in separate directories under the design/subdirectory. The library references maintained in the archived libraries are updated to reflect the new locations of the reference libraries in the archive location.

The logic .db libraries that are copied come from the variables **search_path**, **target_library**, and **link_library**. target_library and link_library contain a list of logic libraries. Minimum libraries set using the command **set_min_library** will also be copied. If the variables are not set or the files not found, then it is not copied to the archive location. Logic .db libraries will be stored under the logic_db/ subdirectory.

TLU+ files that are archived are defined with the **set_tlu_plus_files** command. If no values have been specified or the files not found, then the TLU plus file will not be copied. TLU+ files will be stored under the tlu_plus/ subdirectory.

The design_setup.tcl file contains variable initializations that can be sourced by the user. It contains the values of application variables from the current session similar to the output of **write_app_var**. Variable settings in the design_setup.tcl file may be modified from the current session values to reflect the new archive location. This file will be stored in the root directory of the archive location.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example is a typical usage of **archive_design**:

```
prompt> source ~/my_designs/ORCA/orig_data/design_setup.tcl
prompt> archive_design -source ~/my_designs/ORCA/design -
design "icc_top_route icc_top_place" -archive my_archive
```

search_path(3)
target_library(3)
link_library(3)
set_min_library(2)
write_app_var(2)

assign_flip_chip_nets

Creates or reconnects nets between flip chip drivers to bumps.

SYNTAX

```
status assign_flip_chip_nets
[-personality_type personality_type_list]
[-prefix prefix]
[-uniquify num_to_uniquify]
[-eco]
```

Data Types

<i>personality_type_list</i>	list
<i>prefix</i>	string
<i>num_to_uniquify</i>	integer

ARGUMENTS

-personality_type *personality_type_list*

Specifies a list of personality types for matching the flip chip drivers and bumps. Only drivers and bumps with identical personalities are matched. Each personality type is a string name.

By default, the tool processes all personality types.

-prefix *prefix*

Specifies a prefix string name. Use this option when a new net must be generated to connect a flip-chip driver and a bump.

-uniquify *num_to_uniquify*

Specifies whether to and how to uniquify the driver nets inside a driver group. A driver group is multiple drivers whose flip-chip ports are connected by the same net. The *num_to_uniquify* argument accepts integers from -n to 0 to n.

n means n-to-1 uniquify and to assign one bump for every n flip-chip driver port.

1 means 1-to-1 uniquify and to assign one bump for each flip-chip driver port. New nets will be created with the original net name followed by "#". For example, VDD net will be uniquified to VDD, VDD_1, VDD_2, ...

0 means "do not uniquify" and to assign only one bump for the multiple flip-chip driver ports. The original driver net is reused.

-n means 1-to-n connection and to assign n bumps for each flip-chip driver port.

The default behavior is 1-to-1 uniquify.

To form a 1-to-n connection, first assign_flip_chip_nets with "-uniquify 1", then assign_flip_chip_nets again with "-uniquify -n."

-eco

Assigns flip-chip nets only for unconnected drivers or bumps or both, and keeps the existing flip-chip connections.

DESCRIPTION

Based on the current placement results, you can use this command to locate the nearest unassigned bumps, match them to flip-chip drivers using the shortest wire length method, and then automatically assign new logical nets or reconnect the nets between the flip-chip bumps and drivers. According to the **-uniquify** style you specify, the matching can be 1-to-1 or n-to-1 (n drivers to 1 bump) or 1-to-n (1 driver to n bumps).

For bumps with an existing logical connection, the previous connection to the bump is removed and a new bump is assigned. The newly matched bump is reconnected to the matching flip-chip driver. The new bump net inherits the net name from the flip-chip driver pad to which the bump is now connected. A new net is created only if the flip-chip driver pad has no existing net connection.

The driver-to-bump matching is processed by personality types previously defined by the **set_flip_chip_type** command. Only drivers and bumps with identical personality types are matched. The tool does not process unspecified personality types if you use the **-personality_type** option.

Prerequisites

Use the **set_attribute** command to specify a port of the flip-chip driver cell as the designated flip-chip port. This identifies the port that is used to connect to a bump.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example performs driver-to-bump matching of the personality types "red" and "yellow".

```
prompt> assign_flip_chip_nets -personality_type {"red" "yellow"}
```

The following example performs 3-to-1 driver-to-bump matching

```
prompt> assign_flip_chip_nets -uniquify 3
Matching 8 POWER flip chip driver ports to 3 bumps using Munkres algorithm...
Initializing Munkres Matrix...
Solving Munkres Matrix...
>>>>>>>>>>>>>>>>>>
Storing the matching result...
Clearing up Munkres...
Uniquified net vdd_1 being created from original net vdd
Uniquified net vdd_2 being created from original net vdd
Total 8 drivers-bumps match of all
```

```
prompt> report_flip_chip_driver_bump
BUMP_CELL NET DRIVER_CELL(S)
"BUMP1" "vdd_1" "VDDPST_1" "VDDPST_2" "VDDPST_3"
"BUMP2" "vdd_2" "VDDPST_4" "VDDPST_5" "VDDPST_6"
"BUMP3" "vdd" "VDDPST_7" "VDDPST_8"
```

SEE ALSO

`set_flip_chip_type(2)`
`merge_flip_chip_nets(2)`

balance_inter_clock_delay

Performs interclock delay balancing.

SYNTAX

```
status balance_inter_clock_delay
[-clock_trees list_of_clocks]
[-max_target_delay float_value]
[-operating_condition min | max | min_max]
```

Data Types

<i>list_of_clocks</i>	list
<i>float_value</i>	float

ARGUMENTS

-clock_trees *list_of_clocks*

Performs interclock delay balance on the clocks specified in the *list_of_clocks*. When this option is omitted and no balance group defined, the balancing is performed on all clocks in the design. When this option is omitted and any balance group defined through set_inter_clock_delay_options, the balancing is performed on clocks defined in balance groups.

-max_target_delay *float_value*

Specifies the maximum target delay using a positive float value. The tool balances all of the clocks' longest paths up to the **-max_target_delay** value if no other higher priority options are specified.

-operating_condition *min | max | min_max*

Sets the operating condition to reflect the worst case (such as long delays, low voltage, or high temperatures). This option can be combined with another operating condition. If no operating condition option is specified (*min*, *max* or *min_max*) is set, the default is **-max**.

DESCRIPTION

The **balance_inter_clock_delay** command performs interclock delay balance by inserting delay cells at the root of the clock to meet the clock insertion delay requirements. If timing violations occur due to an unbalanced clock insertion delay in a different clock domain, set a clock delay requirement with a small longest path delay value and run the **balance_inter_clock_delay** command. This minimizes the differences between the longest paths among the clocks.

Multicorner-Multimode Support

This command uses information from the clock tree synthesis scenario.

EXAMPLES

The following command performs interclock delay balance using the maximum target delay options:

```
prompt> balance_inter_clock_delay\
-max_target_delay 0.5
```

The following command performs interclock delay balance for the *CLK1* clock tree to 0.5ns and *CLK2* to 0.8ns, by using the **set_inter_clock_delay_options** command and the **balance_inter_clock_delay** command:

```
prompt> set_inter_clock_delay_options\
-target_delay_clock CLK1\
-target_delay_value 0.5
prompt> set_inter_clock_delay_options\
-target_delay_clock CLK2\
-target_delay_value 0.8

prompt> balance_inter_clock_delay
```

The following command performs interclock delay balance for the *CLK1* clock tree lags *CLK2* by 0.5ns, using the **set_inter_clock_delay_options** command and the **balance_inter_clock_delay** command:

```
prompt> set_inter_clock_delay_options\
-delay_offset 0.5\
-offset_to CLK1 -offset_from CLK2

prompt> balance_inter_clock_delay
```

The following command performs interclock delay balance only on *CLK4* and *CLK5* under the worst and the best operating conditions, even though the design may have *CLK1*, *CLK2*, and *CLK3* clocks:

```
prompt> balance_inter_clock_delay\
-clock_trees [get_clocks {CLK4 CLK5}]\
-operating_condition min_max
```

SEE ALSO

`set_inter_clock_delay_options(2)`

calculate_caa_based_yield2db

Calculate critical area analysis based yield and add it into db library.

SYNTAX

```
status calculate_caa_based_yield2db
library_name/db_file_name
-particle_distr_func_file file_name]
[-data_kit_type tsmc | tsmc_encr]
[-layer_alias_dsd_format {x_y_z_r_t}]
[-output db_file_name]
```

ARGUMENTS

```
-particle_distr_func_file file_name
    Specifies the particle distribution function file. User can define
    ShrinkFactor in this file for half-node support. The shrinkage factor impacts
    the total critical area in Poisson equation, thus impact to the cell yield.
    If ShrinkFactor is not specified, default to 1. It is mandatory.

-data_kit_type tsmc | tsmc_encr
    Specifies the data kit type. Currently, it only support tsmc or tsmc_encr.
    If the particle distribution function file from tsmc is plain text format,
    use the tsmc data kit type, if it's in encrypted format, please use the
    tsmc_encr type. Default is tsmc_encr.

-layer_alias_dsd_format {x_y_z_r_t}
    The -layer_alias_dsd_format option is needed when there are multiple routing
    layers defined in the library and CAA tables. It specifies the metal scheme
    that will be used for the tapeout. The order is {Mx My Mz Mt Mr}. For example,
    {5 2 1 0 0} means that M2, M3, M4, M5, and M6 are Mx layers; M7 and M8 are
    My; and M9 is Mz. For more details about the metal scheme, consult the TSMC
    manual.

-output db_file_name
    Specifies the db file name to be written out, it will contains the CAA based
    yield data directly if the calculation finished successfully. It's optional
    when the input is a library_name, as users can choose using write_lib to write
    out the CAA yield db. It becomes required when the input is a .db file
```

DESCRIPTION

Command **calculate_caa_based_yield2db** calculate CAA based yield, using critical_area_table defined in input library, particle distribution function, routing layer alias dsd format, then add cell yield model to library db file. This data can be used to improve yield in many stages of the whole design flow by various methods, such as yield based cell swapping, optimization, etc.

The cell yield data is stored as cell attribute, by the format of "failure rate", from the Poisson equation, we can know their relationship: Cell_CA_Yield = exp (-Cell_FR); Cell failure rate can be reported by "report_lib yield <library_name>", if

the library is generated from .lib.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example calculates CAA based yield for library read from "test.lib" , and write out "yield.db" file which contains yield data.

```
prompt> read_lib test.lib
prompt> calculate_caa_based_yield2db test -
particle_distr_func_file ddk_1.txt \
    -data_kit_type tsmc caa_yield -layer_alias_dsd_format {1 2 1 2 1}
prompt> write_lib test -output yield.db
prompt> report_lib -yield test
```

SEE ALSO

[report_critical_area\(2\)](#)

cd

Changes the current directory.

SYNTAX

```
int cd  
[directory]
```

Data Types

directory string

ARGUMENTS

directory
Any existing directory name.

DESCRIPTION

Changes the current directory to *directory*. If you specify no argument, your login or home directory becomes the new current directory. By default, the current directory is the directory where dc_shell or the Design Analyzer is invoked.

A file specification of dot (.) is shorthand for the current directory. Dot is commonly included in the **search_path** variable. Changing the current directory changes the interpretation of ".." in the **search_path** variable.

Changing the current directory in the Design Analyzer does not affect the current directory of the your UNIX environment.

Note: The **sh** command cannot be used to change directories.

EXAMPLES

```
prompt> cd /usr/designer
```

```
prompt> pwd  
/usr/designer
```

```
prompt> cd joe
```

```
prompt> pwd  
/usr/designer/joe
```

```
prompt> cd ../bob
```

```
prompt> pwd  
/usr/designer/bob
```

```
prompt> cd ~
```

```
prompt> pwd  
/usr/designer/joe  
  
prompt> cd ~doug  
  
prompt> pwd  
/usr/designer/doug  
  
prompt> cd  
  
prompt> pwd  
/usr/designer/joe  
  
prompt> cd /usr/designer  
  
prompt> ls  
bob      designs      doug  
joe      one.db       two.db  
  
prompt> cd designs  
  
prompt> ls  
one.db      other.db  
  
prompt> search_path = ". ~"  
  
prompt> read {one.db, two.db}  
Loading db file '/usr/designer/designs/one.db'  
Loading db file '/usr/designer/joe/two.db'  
  
prompt> cd /tmp  
  
prompt> read one.db  
Loading db file '/usr/designer/joe/one.db'
```

pwd(2)

change_fp_soft_macro_to_black_box

Converts the specified soft macros to black boxes.

SYNTAX

```
status change_fp_soft_macro_to_black_box
black_boxes
```

ARGUMENTS

`black_boxes`
Specifies the soft macros to convert.

DESCRIPTION

Converts the specified soft macros to black boxes (the original soft macro is removed and replaced with an empty one).

All instantiated subdesigns and leaf cells in the specified soft macro are removed from the logical (hierarchy preservation) information in the database.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example converts the soft macro alu1 to a black box.

```
prompt> change_fp_soft_macro_to_black_box [get_cell alu1]
```

SEE ALSO

`estimate_fp_black_boxes(2)`
`get_cells(2)`

change_link

Changes the design to which a cell is linked.

SYNTAX

```
status change_link
object_list
design_name
[-all_instances]
```

Data Types

object_list	list
design_name	string

ARGUMENTS

object_list
Specifies the cells or references in the current design for which the link is to be changed.

design_name
Specifies the name of the design to which the cells or references in object_list are to be linked.

-all_instances
Enables the command to accept instance cells in the object_list.

DESCRIPTION

The **change_link** command specifies a design that the link for a cell or reference is changed to. If a cell is specified, it is changed to be one occurrence of the specified design. If a reference is specified, all cells of the given reference type are changed to be occurrences of the design.

The cell or reference link can only be changed to a compatible design. For example, the design must have the same number of ports with the same name and direction as the cell or reference.

This command can also be used to change the reference of a physical-only cell to another physical-only library cell.

Physical-only and standard cells are not compatible, so a physical only cell's reference can be changed to only another physical-only library cell. Similarly, references of standard cells can be changed to logical library cells only.

While the *design_name* argument accepts names in the format *library/library_cell*, it does not imply that the actual library cell used for the new cell will be from the specified library. The actual library cell used is determined by the current link library settings.

During **change_link** activity, all Synopsys database format link information is copied from the old design to the new design. If the old design is a synthetic module, all attributes of the old synthetic module are moved to the new link. After running the **change_link** command, run the design with the **link** command.

Use the **-all_instances** option when any cell in *object_list* is an instance in the lower hierarchy and its parent cell is not unique. All similar instance cells under the same parent design are automatically linked to the new reference design. The current design does not have to be changed in order to change the link for the instance cells in the lower design hierarchy. If none of the cells in *object_list* is an instance in the lower hierarchy, or if its parent cell is unique, the **-all_instances** option is not required.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **-all_instances** option:

```
prompt> get_cells -hierarchical -filter "ref_name == bot"
{mid1/bot1 mid1/bot2}
1

prompt> get_cells -hierarchical -filter "ref_name == IVA"
{mid1/bot1/inv1 mid1/bot2/inv1 mid1/bot1/inv2 mid1/bot2/inv2 mid1/inv3}
1

prompt> change_link mid1/bot1/inv1 lsi_10k/IVAP -all_instances
Information: Changed link for all instances of cell 'inv1' in subdesign 'bot'.
(UID-193)
1

prompt> get_cells -hierarchical -filter "ref_name == IVAP"
{mid1/bot1/inv1 mid1/bot2/inv1}
1

prompt> get_cells -hierarchical -filter "ref_name == IVA"
{mid1/bot1/inv2 mid1/bot2/inv2 mid1/inv3}
1
```

In the above example, the *bot* design has cells named *inv1* and *inv2* that were linked to *lsi_10k/IVA*. The *mid1/bot1* and *mid1/bot2* cells instantiate the *bot* design. The *mid1/inv3* cell is also linked to *lsi_10k/IVA*. After running **change_link** in the example, the *mid1/bot1/inv1* and *mid1/bot2/inv1* cells are relinked to *lsi_10k/IVAP*, because they are the instances of the same *inv1* cell in the *bot* design. The *mid1/bot1/inv2* and *mid1/bot2/inv2* cells are not relinked because they are not the instances of the *inv1* cell in the *bot* design. The *mid1/inv3* cell is not relinked because it is not in an instance that instantiates the *bot* design.

SEE ALSO

`link(2)`

change_macro_view

Changes the view of the macro that is used.

SYNTAX

```
status change_macro_view
-reference cell_reference_name
-view view_name
[-quiet]
```

Data Types

<i>cell_reference_name</i>	string
<i>view_name</i>	string

ARGUMENTS

```
-reference cell_reference_name
    Specifies the cell reference name for which we want to change the reference
    view.
    All instances of the cell reference will use the view specified by -view
    view_name.

-view view_name
    Specifies the view name that will be used.
    Valid values: FRAM and CEL.

-quiet
    Suppresses the messages.
```

DESCRIPTION

This command changes the macro's view. All instances of the cell reference are affected by this command.

The command returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example replaces the existing CEL view with the FRAM view for the mem_ctrl macro.

```
prompt> change_macro_view -reference mem_ctrl -view FRAM
```

The following example defines that the CEL view is to be used for the mem256x16

reference cell.

```
prompt> change_macro_view -reference mem256x16 -view CEL
```

SEE ALSO

`create_macro_fram(2)`

change_names

Changes the names of ports, cells, and nets in a design.

SYNTAX

```
integer change_names
[-rules name_rules]
[-hierarchy]
[-verbose]
[-names_file names_file]
[-log_changes log_file]
[-restore]
[-dont_touch object_list]
[-instance instance]
[-new_name new_name]
```

Data Types

<i>name_rules</i>	string
<i>names_file</i>	string
<i>log_file</i>	string
<i>object_list</i>	list
<i>instance</i>	string or instance object
<i>new_name</i>	string

ARGUMENTS

-rules *name_rules*
Specifies a name rule set that details the rules for modifying names to which the object names conform. The *name_rules* file is defined by using the **define_name_rules** command. By default, this value is the *name_rules* file specified by the **default_name_rules** variable. The tool ignores the **-rules** option if you specify the **-names_file** option.

-hierarchy
Specifies that all names in the design hierarchy are to be modified. By default, the tool changes only objects in the *current design*.

-verbose
Specifies that every name change is to be reported. By default, the tool provides only a summary detailing the number of name changes in the design.

-names_file *names_file*
Specifies a file of manual name changes for designs in dc_shell. By default, the command automatically makes name changes. If you specify this option, the tool ignores the **-rules** option.

-log_changes *log_file*
Specifies the log file in which to cumulatively record all name changes to the specified file. If the tool executes multiple **change_names** commands, the *log_file* must be empty before the first **change_names** command is executed.

```

-restore
    Reverses the changes recorded in the names_file during the current session
    and restores the contents of the file to the state it was in when opened.

-dont_touch object_list
    Specifies the designs on which the change_names command is not to be applied.
    By default, there is no design in the list. Any design under the hierarchy
    of the current design can be added to the list to be labeled dont_touch,
    ensuring that change_names does not apply any changes to them. Name "." is
    considered to be the current design.

-instance instance
    Specifies the instance on which the change_names command is to be applied.
    This option must be used with -new_name to specify a new instance name. This
    option is mutually exclusive with all other options except -new_name and -verbose.

-new_name new_name
    Specifies the new instance name when -instance option is used. The new name
    must consist of only alphanumeric characters and the underscore (_), and must
    start with an alphabetical character. The new name cannot be a reserved word
    using by Verilog, System Verilog, or VHDL. The new name should not conflict
    with existing instance, port, and net name within the same design. The leading
    backslash will be removed from the new name.

```

DESCRIPTION

Changes the names of ports, cells, and nets in a design to conform to specified name rules. This command cannot be used to change the names of library cells. Names are changed so that they are unique within the design, but only if they do not conform to the specified rules. Names are also changed to enforce the bus member to use the same base name as its owning bus. Use the **report_names** command to show the effects of executing this command without actually making the changes.

Note that if you examine the **report_names** report and do not want the names of bus members to be changed to use the same base name as the owning bus, set the **change_names_dont_change_bus_members** environment variable to **true** and run the command again.

There are two primary reasons for using the **change_names** command:

- It enables you to modify design object names in the tool so that the names match those that are ultimately created for a design by the **write** command. The names the tool displays in reports and in other information match those used in your target system.
- It enables you to define naming rules specific to your target system that might not be included in a **write** command format. For example, you might be using VHDL as a design transfer mechanism, but the naming rules of your system might be more restrictive than those supported by the true VHDL format.

To obtain a list of available name rules, use the **report_name_rules** command. For information on naming rules that can be affected during the execution of the **change_names** file, see the **define_name_rules** man page.

When you execute **change_names** with no options specified, it operates on ports, cells, and nets in the *current design*. When you specify the **-hierarchy** option, changes are expanded to include all design objects within the *current design* object hierarchy. Specifying the **-names_file** option overrides all other options. The **names_file** option contains a mapping of user-defined name changes. These name changes are not subject to any name rules, but an error is reported if any name changes are nonunique.

The names file specified by *names_file* in the **-names_file** option has one format without a delimiter and another format with a semicolon (;) as a delimiter. These formats are described below.

Names File Without a Delimiter

This format matches the format of the **report_names** command output. Thus, the output of **report_names** can be redirected to a file, edited, and then reused as input to the **change_names** command.

If you are creating this format of the names file, all information above the report bar formed by the dashed line (-----) is ignored. If no report bar is present in the file, the file is parsed. After the bar, each line of the file is parsed into four fields. The fields must be separated by whitespace characters, such as blanks, tabs, or new lines. The fields are as follows:

```
design_name    object_type    object_name    new_name
```

Names File With a Delimiter

Create a names file with a delimiter (;) using the methodology described in the **Names File Without Delimiter** section above, and adding the following line above the report bar formed by the dashed line (-----):

```
use delimiter:true
```

The fields must be separated by whitespace characters, such as blanks, tabs, or new lines. The fields are as follows:

```
design_name    object_type    object_name    new_name ;
```

The *design_name* is a design currently read into the tool. The *object_type* is a port, cell, or net. The *object_name* is the name of an object within the specified *design_name*. The *new_name* is the name designated to replace *object_name*.

Following these rules and assuming that *TOP* is the current design, the example names file can be reformatted and still be valid.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows a names file without a delimiter:

```
*****  
Report : names  
  -rules MY_RULES  
Design : TOP  
Version: v3.0  
Date   : Tue Aug 13 14:24:23 2007  
*****
```

Design	Type	Object	New Name
TOP	cell	U\$1	U_1
TOP	net	NET_NAME_IS_WAY_TOO_LONG	NET_NAME_IS_WAY_TOO
TOP	net	12345	N12345

The following example shows a names file with a delimiter:

```
use delimiter:true  
  
Design      Type    Object      New Name  
-----  
TOP         cell    U$1        U_1 ;  
TOP         net     NET_NAME_IS_WAY_TOO_LONG  
                         NET_NAME_IS_WAY_TOO ;  
TOP         net     12345      N12345 ;  
  
TOP cell U$1 U_1  
. net NET_NAME_IS_WAY_TOO_LONG NET_NAME_IS_WAY_TOO  
TOP net 12345 N12345
```

The following example shows how to change the names in the *current design* to conform to the rules defined by the **default_name_rules** variable:

```
prompt> list default_name_rules  
default_name_rules = "EXAMPLE"  
  
prompt> change_names  
Information: Using name rules 'EXAMPLE'.  
Information: 4 names changed in design 'TOP'.
```

The following example shows how to use the **-verbose** option to show each name changed by the **change_names** command.

```
prompt> change_names -verbose  
Information: Using name rules 'EXAMPLE'.  
  
Design      Type    Object      New Name  
-----
```

change_names

TOP	port	A1	a_
TOP	port	A2	a_a
TOP	port	A3	a_b
TOP	port	A4	a_c

The following example shows how to use the **-hierarchy** option to change names throughout the design hierarchy. Typically, you want to change the names of all designs in the hierarchy to conform to your name rules.

```

prompt> change_names -hierarchy
Information: Using name rules 'EXAMPLE'.
Information: 12 names changed in design 'HALF_ADDER'.
Information: 35 names changed in design 'SUBTRACTOR'.
Information: No names changed in design 'TOP'.

```

The following example shows how to use the **define_name_rules** command to create a set of simple name rules. In this example, the name rules require that all names use uppercase characters or numerals.

```

prompt> define_name_rules CAPS_ONLY -allow "A-Z 0-9"

prompt> change_names -rules CAPS_ONLY -verbose
Information: Using name rules 'CAPS_ONLY'.

```

Design	Type	Object	New Name
MY_BUFFER	port	a1	A1
MY_BUFFER	port	a2	A2
MY_BUFFER	port	b1	B1
MY_BUFFER	port	b2	B2
MY_BUFFER	cell	u1	U1
MY_BUFFER	cell	u2	U2

The following example shows how to make manual name changes to design objects by using the **report_names** and **change_names** commands. First, a report of all of the original design objects is redirected to a file. This file is then edited to make manual changes. Finally, the edited names file is used to direct name changes made by **change_names**. In this case, name rules are ignored and your manual changes are given precedence.

```

prompt> report_names -original > TOP.names
prompt> /* Edit the names file TOP.names here */
prompt> change_names -names_file TOP.names
Information: 15 names changed using names file 'TOP.names'

```

The following example shows how to use the **-instance** option to change one instance name.

```
prompt> change_names -instance a1 -new_name a2
```

`define_name_rules(2)`
`report_name_rules(2)`
`report_names(2)`
`default_name_rules(3)`

change_selection

Changes the selection in the GUI, taking a collection of objects and changing the selection according to the type of change specified.

SYNTAX

```
int change_selection
[-name slct_bus]
[-replace]
[-add]
[-remove]
[-toggle]
[-type object_type]
[-clock_trees clock_tree_list]
collection
```

Data Types

<i>slct_bus</i>	string
<i>object_type</i>	list
<i>clock_tree_list</i>	list
<i>collection</i>	list

ARGUMENTS

-name *slct_bus*
Specifies to change the selection bus by using the value of *slct_bus*. By default, the command changes the selection bus by using the name *global*.

-replace
Replaces the current selection with the objects in the collection. This is the default behavior of the command if you do not specify any optional parameter.

-add
Adds the objects in the collection to the current selection. By default, this option is off.

-remove
Removes the objects that are specified in the collection from the current selection. By default, this option is off.

-toggle
Adds each item that is specified in the collection to the selection bus if it is not currently contained there. If it is currently contained in the selection bus, remove it. By default, this option is off.

-type *object_type*
Specifies the type to change. Only those items from the collection that are of the type specified by *object_type* are used to change the selection. The valid values are **design**, **port**, **net**, **cell**, **pin**, and **path** (timing path). By default, the command uses the entire collection.

```
-clock_trees clock_tree_list
    Specifies a list of clock trees for changing the selection. By default, this
    option is off.

collection
    Specifies the collection of objects to use to change the selection. The type
    of change that is applied to the current selection with the collection is
    specified by the optional parameters listed above. By default, this option
    is off.
```

DESCRIPTION

The **change_selection** command changes the selection in the GUI. When selections are changed, the GUI updates all relevant windows to reflect it.

A collection of objects and the type of change are given as input to the command. The collection of objects might be returned as the result of another command such as the **get_designs** command. If the collection is empty and you use the **-replace** option (or let the command default by specifying no option), the current selection is cleared.

If you use the **-type** option, only the type of objects specified are used to change the current selection. For example, if you use **-type design**, the command uses only the design objects in the collection to change the current selection. If you do not use **-type** option, all objects in the collection are used to change the current selection. For example, if you use the **-add** option without using the **-type** option, all objects, regardless of their type, are added to the current selection.

For information about collections, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example replaces the current selection with the collection of design objects, regardless of type.

```
prompt> change_selection [get_designs]
```

The following example adds a cell named U5 to the selection made in the example above.

```
prompt> change_selection -add [get_cells U5]
```

The following example removes all pin objects from the current selection.

```
prompt> change_selection -remove -type pin [get_selection]
```

The following example clears the selection.

```
prompt> change_selection ""
```

The following example creates a new selection bus and adds a net named n1 to the selection.

```
prompt> set slct [create_selection_bus]
prompt> change_selection -name $slct [get_nets 1]
```

SEE ALSO

`collections(2)`
`filter_collection(2)`
`get_selection(2)`
`query_objects(2)`

change_tie_connection

Changes tie connection of the specified signal pins and ports.

SYNTAX

```
status change_tie_connection
[-net net]
-port port_list
-pin pin_list
```

Data Types

<i>net</i>	list
<i>port_list</i>	list
<i>pin_list</i>	list

ARGUMENTS

-net *net*

Specifies the net to connect. The net must be a power or ground net, a scalar (single bit) net, and must exist in the current design.

This argument is optional. If no net is provided, and the pins or ports are currently connected to a PG net, they will be disconnected.

-port *port_list*

Specifies a list of signal ports to which the PG net is connected.

A port can be at top level or any other hierarchical level. Use "-port" to change the connection for a hierarchical port inside the module.

For example, "-port ma(mb/Q)" means Q's connection will be changed inside hierarchical scope "ma(mb". While, "-pin ma(mb/Q)" means Q's connection will be changed inside hierarchical scope "ma".

If a specified port is already connected to a signal net, the tool issues an error message and reminds the user to use disconnect_net to disconnect first. If a specified port is already connected to a PG net, the tool automatically reconnects the port.

This argument is optional. If not specified, "-pin" argument must be presented.

-pin *pin_list*

Specifies a list of signal pins to which the PG net is connected.

If a specified pin is already connected to a signal net, the tool issues an error message and reminds the user to use disconnect_net to disconnect first.

If a specified pin is already connected to a PG net, the tool automatically reconnects the pin.

This argument is optional. If not specified, "-port" argument must be presented.

DESCRIPTION

This command changes tie connection on a list of signal pins and signal ports to the specified PG nets. PG nets include nets specified by **mw_logic1_net** and **mw_logic0_net**.

variables.

Both "-port" and "-pin" can be specified at the same time. At least one of the two must be specified.

The net should be at top level or be at the same hierarchy level as the pins or ports. A net can be connected to many pins or ports; however, you cannot connect a pin or port to more than one net.

To disconnect objects on a net, do not use the **-net** option.

To display pins and ports on a net, use **all_connected** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **change_tie_connection** to change signal pin U7/A connection from tie low to tie high. The **all_connected** command is used to verify the Milkyway net connection before and after the command.

```
prompt> all_connected [get_pin U7/A]
{VSS}
prompt> change_tie_connection -net VDD -pin [get_pin U7/A]
Connecting power net 'VDD' to pin 'U7/A'.
prompt> all_connected [get_pin U7/A]
{VDD}
```

The following example shows the error message generated when you attempt to disconnect a PG pin.

```
prompt> change_tie_connection -pin U7/VDD
Error: PG leaf pin is not supported by this command. (UIED-65)
```

characterize

Captures information about the environment of specific cell instances, and assigns the information as attributes on the design to which the cells are linked.

SYNTAX

```
int characterize
cell_list
[-no_timing] [-constraints]
[-connections] [-power]
[-verbose]
```

Data Types

cell_list list

ARGUMENTS

cell_list
A list of cells in the current design whose designs are to be characterized.

-no_timing
Indicates not to characterize the timing characteristics of the design.
Attributes representing the timing environment or requirements will not be placed on the subdesigns.

-constraints
Indicates to place area, power, connection class, and design rule constraint information on the subdesigns.

-connections
Indicates to characterize the connection attributes of the design.

-power
Indicates to use the switching activity information of the cells in *cell_list* to annotate the corresponding subdesigns.

-verbose
Indicates to echo equivalent commands that are applied to the subdesign being characterized.

DESCRIPTION

This command places on a design the information and attributes that characterize its environment in the context of a specified instantiation in another design.

The primary purpose of **characterize** is to capture the timing environment of the subdesign. This happens if **characterize** is used with no arguments, and if **-constraint**, **-connection**, or **-power** is used.

The command derives and asserts the following on the design to which the instance is

linked:

Unless **-no_timing** is specified, **characterize** places on the subdesigns any timing characteristics previously set by the following commands:

```
create_clock
group_path
read_sdf
read_clusters
set_annotated_check
set_annotated_delay
set_auto_ideal_net
set_disable_timing
set_drive
set_driving_cell
set_false_path
set_ideal_latency
set_ideal_net
set_ideal_transition
set_input_delay
set_load
set_max_delay
set_min_delay
set_multicycle_path
set_operating_conditions
set_output_delay
set_resistance
set_timing_ranges
set_wire_load_model
set_wire_load_mode
set_wire_load_selection_group
set_wire_load_min_block_size
```

If **-constraint** is specified, **characterize** places on the subdesigns any area, power, connection class, and design rule constraints previously set by the following commands:

```
set_max_area
set_max_power
set_dont_touch_network
set_ideal_network
set_ideal_net
set_connection_class
set_fanout_load
set_max_capacitance
set_max_fanout
set_min_porosity
set_fanout_load
set_max_transition
set_min_capacitance
set_cell_degradation
set_fix_multiple_port_nets
```

If **-connections** is specified, **characterize** places on the subdesigns any connection

attributes previously set by the following commands:

```
set_equal  
set_opposite  
set_logic_one  
set_logic_zero  
set_logic_dc  
set_unconnected
```

NOTE: connection_class information is applied only if **-constraint** is used.

If **-power** is specified, **characterize** places on the subdesigns any switching activity information, toggle rates, and static probability previously set, calculated, or saved by the following commands:

```
report_power  
set_switching_activity
```

In most cases, characterizing a design removes the effects of any previous characterization and replaces all the relevant information. However, in the case of back-annotation, (**set_load**, **set_resistance**, **read_sdf**, **set_annotated_delay**, **set_annotated_check**), the annotations are moved during the characterize step, and cannot overwrite existing annotations made on the subdesign. In this case, annotations must be explicitly removed from the subdesign (using **reset_design**) before running **characterize** the next time.

characterize can be used with **set_dont_touch** to maintain hierarchy during optimization. This method of optimization is known as bottom-up optimization. It can be applied using a golden instance or a uniquify approach. An alternative to bottom-up optimization is top-down optimization, otherwise known as hierarchical compile. In top-down optimization, the tool performs characterization and optimization of subdesigns automatically.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example shows the golden instance approach to bottom-up optimization. This is useful when the same design is used in several places, with a similar environment. **characterize** and **set_dont_touch** are used to optimize the subdesign once and reference that optimized design in several places. The characterization is done using a golden instance (U1 in this case) and reflects the environment of that instance. Assume that U1 and U2 both reference design ADDER and have similar environments.

Characterize the ADDER design with respect to instance "U1" and compile it.

```
prompt> current_design TOP  
prompt> characterize U1  
prompt> current_design ADDER
```

```

prompt> compile

Compile the top level while preserving "U1" and "U2".
prompt> current_design TOP
prompt> set_dont_touch {U1 U2}
prompt> compile

```

The following example shows the uniquify approach to bottom-up optimization. If a design is used in more than one place with different environments, use the **uniquify** command to create a design for each instance. You can now characterize the new designs and optimize each separately.

Uniquify the hierarchy so that all hierarchical cells reference different designs. This creates new design names such as ADDER_1 and ADDER_2.

```

prompt> current_design TOP
prompt> uniquify

```

Characterize the unique designs with respect to their environments, and compile each.

```

prompt> characterize {U1 U2}
prompt> current_design ADDER_1
prompt> compile
prompt> current_design ADDER_2
prompt> compile

```

Compile the top-level design while preserving U1 and U2.

```

prompt> current_design TOP
prompt> set_dont_touch {U1 U2}
prompt> compile

```

The following example shows top-down optimization. In top-down optimization, the tool implicitly performs characterization for each subdesign.

```

prompt> current_design TOP
prompt> uniquify
prompt> compile

```

check_ccs_lib

Runs validation and correlation on the specified libraries.

SYNTAX

```
check_ccs_lib
    -f config_file_name
```

Data Types

config_file_name string

ARGUMENTS

```
-f config_file_name
    Specifies a configuration file name.
```

DESCRIPTION

This command runs validation and correlation on the specified libraries.

```
Usage: check_ccs_lib -f <config_file>
                  -help Prints this help message.

set debug_correlation yes
set lsf_correlation yes
run correlation
```

SEE ALSO

`check_library(2)`

check_clock_tree

Checks the clock trees of the current design for common problems that can adversely impact clock tree synthesis.

SYNTAX

```
status check_clock_tree
[-clocks clock_list]
```

Data Types

clock_list list

ARGUMENTS

-clocks *clock_list*

Causes the command to only check those clock-trees whose names are in the specified list. If the **-clocks** option is not provided, all clocks in the current design are checked.

DESCRIPTION

The **check_clock_tree** command can be used at any time for a linked design to check for common problems that adversely impact clock-tree synthesis. The following classes of checks are performed:

CTS-810 exceptions defined on hierarchical pins CTS-811 clocks defined on hierarchical pins CTS-821 a master clock does not propagate to a generated clock CTS-822 improperly specified master clock CTS-823 a master clock terminates at a multi-clock pin CTS-831 a clock has no synchronous pins CTS-832 a clock loops to itself CTS-833 cascading master clocks CTS-834 multiple clocks per register CTS-835 exceptions defined on output pins CTS-836 unclocked sink pins CTS-840 multiple exceptions CTS-841 ignored exceptions

Some checks are specific to overlapping clock domains; these require that the shell variable **timing_enable_multiple_clocks_per_reg** be set true in order for the timing-engine to propagate multiple clocks per register. If the variable is set false when **check_clock_tree** is invoked, an extra check will be performed to detect and warn about overlapping clocks (CTS-834).

When **check_clock_tree** encounters a problem, a warning or informational message will be printed, sometimes followed by additional information to make solving the problem easier. There is a man page for each message type that explains the problem in detail and what a user can do to solve it.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

In the following example, the **check_clock_tree** command is used to check all of the clocks in the currently linked design:

```
prompt> check_clock_tree
```

In the following example, the **check_clock_tree** command is used to check a specific list of clocks in the currently linked design:

```
prompt> check_clock_tree -clocks [list clock1 clock2]
```

SEE ALSO

`report_clock_tree(2)`
`report_clock_timing(2)`
`set_clock_tree_exceptions(2)`
`compile_clock_tree(2)`

check_design

Checks the current design for consistency.

SYNTAX

```
status check_design
[-summary]
[-no_warnings]
[-one_level]
[-multiple_designs]
[-no_connection_class]
[-post_layout | -only_post_layout]
```

ARGUMENTS

-summary

Displays a summary of the warning messages instead of one message per warning. This does not affect the way error messages are issued. The **-summary** option used along with the **-post_layout** or the **-only_post_layout** option only displays a summary of the missing back-annotation information.

-no_warnings

Suppresses warning messages, so only error messages are printed.

-one_level

Performs checks at only the current level of hierarchy. By default, **check_design** checks the current level and all designs below it.

-multiple_designs

Reports warning messages related to multiply-instantiated designs. With this option, the tool lists all multiply-instantiated designs along with instance names and associated attributes, such as dont_touch, black_box, and ungroup. By default, these messages are suppressed.

-no_connection_class

Suppresses connection class warning messages. This switch is useful while working on GTECH design/netlist, on which connection class violations are expected. By default, these messages are reported.

-post_layout

Checks the design for annotated information in a links-to-layout flow. The information is annotated on the design after the design has been placed and routed by the backend tool. This includes delay back-annotation, resistance back-annotation, capacitance back-annotation, and PDEF back-annotation; for example, clusters, cell locations, and so forth. The **-post_layout** option lists designs or instances that have any of these annotations missing. The **-post_layout** option must be used at least once for a design flow to validate the back-annotation part of the links-to-layout flow.

-only_post_layout

Checks only the annotated information in a links-to-layout flow. The information includes delay back-annotation, resistance back-annotation,

capacitance back-annotation, and PDEF back-annotation; for example, clusters, cell locations, and so forth. This option lists designs or instances that have any of these annotations missing. The **-only_post_layout** option can be used instead of the **-post_layout** option to validate the back-annotation part of the links-to-layout flow.

DESCRIPTION

The **check_design** command checks the internal representation of the current design for consistency, and issues error and warning messages as appropriate.

Error messages indicate design problems of such severity that **compile** does not accept the design; for example, recursive hierarchy in a design (when a design references itself) is an error. Warning messages are informational and do not necessarily indicate design problems. However, these messages should be investigated.

The **check_design** command flags multiple instances of a design within a system. If a design is instantiated in two different designs, a warning message is issued. For information on how to respond to error messages dealing with multiple instances, see the **uniquify** command man page.

The **check_design -summary** command automatically runs on every design that is compiled. However, you can use the **check_design** command explicitly to see warning messages.

Potential problems detected by this command include unloaded input ports or undriven output ports, nets without loads or drivers or with multiple drivers, cells or designs without inputs or outputs, mismatched pin counts between an instance and its reference, tristate buses with non-tristate drivers, and so forth.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command checks the current design for problems and issues error and warning messages:

```
prompt> check_design
```

The following command checks only the current level of the design:

```
prompt> check_design -one_level
```

SEE ALSO

check_library(2)
check_timing(2)

```
current_design(2)
set_dont_touch(2)
uniquify(2)
check_design_allow_non_tri_drivers_on_tri_bus(3)
```

check_error

Prints extended information on errors from last command.

SYNTAX

```
int check_error
[-verbose] [-reset]
```

ARGUMENTS

-verbose
Displays the list of errors found during previous commands.
By default, the command only returns the error status.

-reset
Resets the list of previously found errors. After resetting the error list,
the **check_error -verbose** command returns an empty list.
By default, the command does not modify the error list.

DESCRIPTION

The **check_error** command is used to compare errors issued by previous commands to the list of error codes specified by the **check_error_list** variable.

If the **check_error** command finds errors that are specified in the **check_error_list** variable, the command returns 1. If the **check_error** command does not find any errors that are specified by the **check_error_list** variable, the command returns 0.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows how to use **check_error** to check if execution errors are specified by the **check_error_list** variable.

```
prompt> list check_error_list
{"UID-3", "EQN-18", "EQN-19"}
```

There is no error found in previous command, so the **check_error** returns 0.

```
prompt> check_error
0
```

```
prompt> link
Warning: Can't read link_library file 'your_library.db'. (UID-3)
Linking design:
    top
Using the following designs and libraries:
```

```
top, left, mux4_0, reg4_1, reg4_0, right, mux4_1, reg4_3, reg4_2, lsi_10k (library)
Loading db file '/remote/dtg678/dcmgr/peac_ls/synopsys/libraries/syn/gtech.db'
Loading db file '/remote/dtg678/dcmgr/peac_ls/synopsys/libraries/syn/standard.s
ldb'
1
prompt> check_error
1
prompt> check_error -verbose
{"UID-3"}
1
```

The following command resets the error list:

```
prompt> check_error -reset -verbose
{"UID-3"}
1
prompt> check_error -verbose
{}
0
```

To use **check_error** in a script to see if specified errors occurred in the previous commands, use the following command:

```
prompt> if( check_error() == 1) {
    echo failure_message
    exit(1)
} else {      echo success_message
}
```

SEE ALSO

`check_error_list(3)`

check_fp_budget_result

Performs post-budgeting timing analysis.

SYNTAX

```
status check_fp_budget_result
[-blocks block]
[-pins pin]
-file_name output_design_report
```

Data Types

<i>block</i>	string
<i>pin</i>	string
<i>output_design_report</i>	string

ARGUMENTS

-blocks *block*

Specifies name of a plan group in the design. It reports budgeting analysis information related to that particular plan group in the design. You can specify the value of *block* by using a collection generated by the **get_cells** command. By default, the command generates the budgeting analysis report for all the pins on all the plan groups.

-pins *pin*

Specifies name of a pin on a plan group in the design. It reports budgeting analysis information related to that particular pin in the design. You can specify the value of *pin* by using a collection generated by the **get_pins** command. By default, the command generates the budgeting analysis report for all the pins on all the plan groups.

-file_name *output_design_report*

Specifies the name of the output design report file to which design information will be written.

DESCRIPTION

This command allows you to generate a report containing budgeted and actual delays through a hierarchical block.

A timing path starts at a start point and ends at an end point. For this report, hierarchical pins divide timing paths into timing path segments. This report prints the actual and budgeted delay for each of these path segments. This helps you to analyze the process of generating budgets for the design.

For each pin on the block, the report lists the worst-case timing paths per clock domain going through the pin. The report shows the budgeted and actual delays for each path segment on the timing path.

This command can be run only after calling the IC Compiler Timing Budgeter.

If you do not specify any of the optional options, the command writes out the information for the entire design. You can specify the **-blocks** or **-pins** option to restrict the information written.

In the report file, the information is divided by soft macro or plan group. All the timing path information related to one soft macro or plan group is printed together.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example creates a report file named *b1.rpt* containing information about a block named *B1* in the design.

```
prompt> check_fp_budget_result -blocks B1 -file_name b1.rpt
```

The following example creates a report file named *all.rpt* containing information about the entire design.

```
prompt> check_fp_budget_result -file_name all.rpt
```

SEE ALSO

allocate_fp_budgets(2)
check_fp_timing_environment(2)
get_cells(2)
get_pins(2)

check_fp_pin_alignment

Checks the soft macro pin alignment QoR.

SYNTAX

```
status check_fp_pin_alignment
[-detour]
[-tolerance real]
[-report_nets]
[-nets collection]
```

ARGUMENTS

-detour

Generates a detour report for soft macro pins.

Note that unlike pin alignment checking, pin detour checking is performed on all two-pin and multi-pin nets connected to soft macros.

To determine the detour measure for a net, two bounding boxes are computed. The first bounding box minimally encompasses all the physical pins connected to the net, both inside and outside the soft macros. The second bounding box only minimally encompasses all the standard cell pins connected to the net (pins on soft macros are excluded). By definition, the first bounding box is at least as large as the second bounding box, and a detour exists if the first bounding box is larger than the second bounding box.

If you specify this option, the tool computes a count of the number of nets in which such a detour exists. When used in conjunction with the **-report_nets** option, the tool generates an actual list of nets with detours. To suppress reporting of nets that are slightly detoured, use the **-tolerance** option.

-tolerance *real*

Specifies the percentage tolerance for the detour report.

This option allows you to specify the percentage in which the perimeter of the first bounding box is allowed to be larger than the perimeter of the second bounding box, before the net is flagged as having a detour. It is useful for suppressing reporting of slightly detoured nets by supplying it with a small tolerance value, such as 0.1.

The valid range for tolerance is from 0 through 100 percent. A tolerance value greater than 100 is reset to 100. A tolerance value less than 0 is reset to 0. The default value for tolerance is 0.

-report_nets

Prints out the individual net names in the pin detour and pin alignment report.

By default, the tool outputs only the detoured net count.

-nets *collection*

Specifies the nets for which soft macro pin alignment and pin detour checks are performed.

DESCRIPTION

This command checks the soft macro pin alignment QoR.

If you do not specify the **-detour** option, the tool performs normal alignment checking. Alignment checking is limited to two-pin nets with at least one connection to a soft macro. Nets not connected to a soft macro or those with more than two connections of any kind are not checked. In particular, a net connected to a top-level pin (that is, a terminal) is not checked unless it is connected to a soft macro on the other end. A text report like the following is produced at the end of the alignment checking:

```
*****
Report: check_fp_pin_alignment pin alignment check
Design: RISC_CORE
Version: C-2009.06
Date: Thu Apr 23 20:10:35 2009
*****
All numbers cited pertain only to two-connection nets with at least one
soft macro connection
186 total two-connection nets
176 alignable two-connection nets (176 non-blocked)
23 unaligned alignable two-connection nets (23 non-blocked)
66 aligned two-connection nets on different metal layers
0 aligned two-connection nets on different metal layers (soft macro ->
soft macro connections)
```

The definitions for terms used in this report are as follows:

alignable nets A two-pin net with only a single soft macro pin is considered alignable if the nonsoft macro pin (a terminal, a standard cell pin, or a hard macro pin) is located within the projection of the soft macro edge on which the soft macro pin is located. A two-pin net connected to soft macros at both ends is considered alignable if the projections of the soft macro edges on which the soft macro pins sit overlap.

non-blocked A two-pin net is considered "non-blocked" if the flyline connecting the two pins is not interrupted by any soft macro or hard macro not connected to the net.

If you specify the **-report_nets** option, the names of all nets that are alignable but are unaligned are printed out.

If you specify the **-detour** option, a detour report is generated. A detour is caused by an invalid soft macro pin placement, which causes routing from the source to targets to be longer than is necessary. The detour report consists of a simple count of the number of nets with a detour measure exceeding the tolerance specified by the **-tolerance** option. Detour measures of interconnected feedthrough nets created by IC Compiler during pin cutting or top-down pin placement are computed as a single net.

If you specify both the **-report_nets** option and the **-detour** option, the individual nets that fail the detour test are listed in the detour report.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example checks the soft macro pin alignment using a detour report.

```
prompt> check_fp_pin_alignment -detour
*****
Report: check_fp_pin_alignment detour check
Design: TOP
Version: C-2009.06
Date: Thu Apr 23 20:10:36 2009
*****
106 pin detours.

prompt> check_fp_pin_alignment -report_nets -detour
*****
Report: check_fp_pin_alignment detour check
Design: RISC_CORE
Version: C-2009.06
Date: Thu Apr 23 20:10:36 2009
*****
2 pin detours.
***** Nets with pin detour, tolerance = 0.000000 *****
OUT_VALID
Oprnd_A[11]
*****
```

SEE ALSO

[check_fp_pin_assignment\(2\)](#)

check_fp_pin_assignment

Performs pin placement checks.

SYNTAX

```
status check_fp_pin_assignment
[-pin_spacing]
[-pin_preroute_spacing]
[-shorts]
[-no_stacking]
[-layers]
[-layers_pg]
[-wiretrack]
[-missing]
[-missing_pg]
[-single_pin]
[-off_edge]
[-outside_pin_guide]
[-block_level]
[-nets net_collection]
[objects]
```

Data Types

objects collection

ARGUMENTS

-pin_spacing

Determines if any two signal pins are closer than the number of wire tracks specified by the **-pin_spacing** option of the **set_fp_pin_constraints** command. By default, the command does not perform this test.

-pin_preroute_spacing

Determines if any signal pin is closer to a preroute than the number of wire tracks specified by the **-pin_preroute_spacing** option of the **set_fp_pin_constraints** command. By default, the command does not perform this test.

-shorts

Checks for shorts. A short occurs if two pins on the same layer touch or overlap each other. By default, the command does not perform this test.

-no_stacking

Determines if pins are placed on legal layers. If the **-no_stacking** option is used in an earlier call to the **set_fp_pin_constraints** command to avoid pin overlaps on different layers, the **-no_stacking** option determines if the rule specified by **-no_stacking** in **set_fp_pin_constraints** is honored. The available **no_stack_type** rules in **set_fp_pin_constraints** are **all**, **pg_pins_only**, and **signal_pins_only**. It is important to note that the type of checks performed on individual macros

depends on the specific stacking setting associated with each macro. For example, if a design has macros A, B, C with the following stacking rules:
A -Pin stacking is allowed for both PG and signal pins.

B -Pin stacking is not allowed on either PG or signal pins.

C -Pin stacking is allowed only for signal pins.

Then, if you use the **-no_stacking** option, the actual tests performed on these macros are as follows:

A -No check for pin stacking is performed, since pin stacking of both kinds is allowed.

B -Pin stacking checks are performed on both PG and signal pins.

C -Pin stacking checks are performed only on PG pins.

Finally, using the **-no_stacking** option implicitly turns on the **-shorts** option. For more information, see the **set_fp_pin_constraints** man page. By default, the command does not perform this test.

-layers

Determines if signal pins are placed on legal metal layers as specified by the **set_fp_pin_constraints** command used with the **allow_layer** option. For the default minimum and maximum metal layers for pin placement, see the **set_fp_pin_constraints** man page. By default, the command does not perform this test.

-layers_pg

Determines if power and ground pins are placed on legal layers. By default, the command does not perform this test.

-wiretrack

Determines if pins are centered on wire tracks. By default, the command does not perform this test.

-missing

Determines if any signal pins are missing. By default, the command does not perform this test.

-missing_pg

Determines if any power or ground pins are missing. By default, the command does not perform this test.

-single_pin

Checks for unrouteable pins on abutted edges. A macro pin is flagged a single (unrouteable) pin if any one of the following scenarios occurs:

1. The macro pin is placed on a part of a macro edge that abuts another macro edge and the macro pin does not abut the other pin on the same metal layer to which it is connected.

2. The macro pin is placed on a part of a macro edge that coincides with the top-level cell boundary and the macro pin is connected to anything other than a terminal (top-level pin), unless the pin is connected solely to other pins on the same macro and those pins are stacked on top of the pin.

3. The macro pin is placed on a part of a macro edge that coincides with the top-level cell boundary and the macro pin is connected solely to a terminal but the terminal is not stacked on top of the macro pin on the same metal layer.

Checks are performed on both soft and hard macro signal pins.

By default, the command does not perform this test. This option is ignored if the **-block_level** option is used.

-off_edge
 Checks if part of a pin outline coincides with an edge. By default, the command does not perform this test.

-outside_pin_guide
 Checks if the center of a pin is not inside the associated pin guide. By default, the command does not perform this test.

-block_level
 Checks block-level pin placement. The tests you specify are performed on terminals (top-level pins). By default, the tests are performed on soft macros pins.

-nets net_collection
 Specifies a collection of nets for which to check pin placement. If you specify this option, the command checks pin placement only on soft macro pins and relevant hard macro pins connected to the specified nets. All relevant pins on specified soft and hard macros are checked if this option is not used. If this option is not used and no macros are specified, checks are performed on all relevant soft macro pins and hard macro pins.

objects
 Specifies the collection of macros for which to check pin placement. The command checks pin placement only on the macros you specify. By default, if no macros are specified, the checks are applied on pins on all soft and relevant hard macros.

DESCRIPTION

This command performs pin placement checks as specified. It reads in relevant constraint values, set earlier by using the **set_fp_pin_constraints** command, to perform the tests.

Note that this command checks pin placement only for soft macro pins, unless the **-single_pins** and/or **-block_level** options are used. Checks are performed on terminals (top-level pins) if the **-block_level** option is used. Routability checks are also performed on hard macro pins if the **-single_pins** option is used. No other checks are performed on hard macro pins.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example checks a soft macro named A for shorted and missing pins. It also determines if any two signal pins are closer than the number of wire tracks previously specified by using the **-pin_spacing** option of the **set_fp_pin_constraints** command.

```
prompt> check_fp_pin_assignment -short -missing \
```

-pin_spacing [get_cells A]

SEE ALSO

check_fp_pin_alignment(2)
set_fp_pin_constraints(2)

check_fp_rail

Checks the integrity of the power network created by power network synthesis, early in the design planning stage.

SYNTAX

```
status check_fp_rail
-nets nets
[-ring]
[-floating_segment]
[-power_switch_connection]
```

Data Types

nets collection or list

ARGUMENTS

```
-nets nets
      Specifies the net name(or names) of the power network for integrity checking.
      If no power straps exist with the specified net name, the command quits and
      issues an error message.
      You can specify a single net name or you can specify multiple net names
      separated by a comma or a space.

-ring
      Only checks the core rings of the power network. If a core ring segment is
      broken, a warning message is issued. By default this option is off.
      "floating_segment" Only checks the floating segments in the power network.
      If a floating segment is detected, a warning message is issued. By default,
      this option is off.
      "-power_switch_connection" Only checks the connection between power switch
      cell input pin and the permanent power/ground straps. If there are
      unconnected power switch input pins, a warning message is issued. This option
      is used in a multi-VDD design with power-down voltage areas. By default, this
      option is off.
```

DESCRIPTION

This command allows you to check the integrity of the power network created by **synthesize_fp_railfp** and **commit_fp_railfp** commands early in the design stage. If there are broken core rings, floating segments, or unconnected power switch input pins in the power mesh, a warning message is issued.

EXAMPLES

The following example shows how to check the VDD ring of a power plan.

```
prompt> check_fp_rail \
-nets {VDD} \
```

-ring

```
prompt> WARNING: Core ring is broken at (123.400 227.900)
```

SEE ALSO

`synthesize_fp_rail(2)`
`commit_fp_rail(2)`

check_fp_timing_environment

Performs timing environment analysis.

SYNTAX

```
integer check_fp_timing_environment
[-block_pin_stats]
[-unbudgetable_pins]
[-unconstrained_pins]
[-exception_pins]
[-static_logic_pins]
[-delay_violators percent]
[-num_pin_connections connections]
[-block_name string]
[-pin_name string]
[-zero_wire_delay slack_percent]
[-bottleneck slack_limit]
[-bottleneck_max_cell num_cells]
[-bottleneck_no_vipo]
[-vipo_timing slack_percent]
[-format_report]
```

Data Types

<i>percent</i>	float
<i>connections</i>	integer
<i>string</i>	string
<i>slack_percent</i>	float
<i>slack_limit</i>	float
<i>num_cells</i>	integer

ARGUMENTS

-block_pin_stats

Specifies whether to print block pin statistics. It prints the number of budgetable pins, the number of unbudgetable pins, and the total number of pins on the block.

-unbudgetable_pins

Specifies whether to print block pins that cannot be budgeted. It prints why each pin cannot be budgeted:

- * Pin is not connected to net
- * Pin is not connected to a top-level net, but is connected to an internal net
- * Pin is not connected to an internal net, but is connected to a top-level net
- * Only fixed delay exists on one side of the pin
- * Timing paths through the pins are not constrained
- * Pin is an input or output clock port
- * Pin is connected to power or ground net, or has set_case_analysis on it

-unconstrained_pins
 Specifies whether to print unconstrained block pins. A pin is unconstrained if it has no timing paths through it.

-exception_pins
 Specifies whether to print block pins touched by an exception. The exception can be set_false_path, set_multicycle_path, set_min_delay, or set_max_delay.

-static_logic_pins
 Specifies whether to print block pins that are set to static logic state. It prints whether a block pin is tied to high or low by a power or ground net in the input netlist. It also reports if a block pin is set to specific state by set_case_analysis, set_logic_one, or set_logic_zero.

-delay_violators percent
 Where *percent* ≥ 0 . Specifies whether to print cells with delays greater than the specified percentage of the capture clock period. The *percent* argument must be greater than or equal to zero. It traverses all the critical paths per clock domain through a block pin.

-num_pin_connections *connections*
 Where *connections* > 0 . Specifies whether to print number of net connections from this block to other blocks, top-level standard cells, pad cells, or to top-level ports. It also specifies the number of connections to be displayed in the GUI for each type of net connection.

-block_name *string*
 Specifies whether to print a budgeting report for a particular block only. The name of block could be a plan group, instance name, or master name.

-pin_name *string*
 Specifies whether to print a budgeting report for a particular pin only. The name of pin must exactly match a pin on the plan group.

-zero_wire_delay *slack_percent*
 Where *slack_percent* < 0 . Specifies whether to perform timing analysis with zero wire delays and print the paths that have slack less than the negative percentage of the capture clock period. Both the path and the number of logic levels on the path are printed.
 The *slack_percent* is the percentage of the clock period that is used as the threshold for printing negative slack paths. It must be greater than or equal to zero.

-bottleneck *slack_limit*
 Specifies whether to report bottleneck cells. It prints the leaf cells that contribute to multiple timing violations. It lists the leaf cell, its reference, and the number of paths through the leaf cell that have timing violations. Based on this report, you can check the fanin and fanout logic to determine the possible cause of the timing bottleneck.
 It also specifies the slack limit for reporting bottleneck cells. Only timing paths having slack less than *slack_limit* are explored for finding bottleneck cells.

-bottleneck_max_cell *num_cells*
 Where *num_cells* > 0 . Specifies the number of bottleneck cells to report. You

must specify a positive integer. If this option is not specified, a maximum of 20 bottleneck cells are reported.

-bottleneck_no_vipo
 Specifies whether to perform virtual in-place optimization (vipo) before reporting bottleneck cells. The default is to run virtual in-place optimization.

-vipo_timing slack_percent
 Specifies whether to report timing analysis results based on virtual in-place optimization (vipo). This report can help visualize the timing analysis report after the actual in-place optimization has been run. It also specifies the slack limit for timing paths in the virtual in-place optimization timing report. Only the paths having slack less than *slack_percent* of the capture clock period are reported.

-format_report
 Specifies whether to format the report in table form. If this option is not specified, the report is printed in a single line format. The report in table form is easier to look at, but may be difficult to parse using automated tools.

DESCRIPTION

This command allows you to generate a report that contains additional design information that helps you analyze the budgets assigned to each block. The block can be a plan group or a soft macro. The report can be used to debug the budgets generated by the IC Compiler design planning timing budgeter.

The additional design information includes, but is not limited to, timing constraints in the design, timing exceptions in the design, delay distribution on the worst timing path through a block port, pins tied to high or low, high negative slack on a timing path, and so on.

This command can be run before or after calling the IC Compiler design planning timing budgeter.

All of the command options are optional. The options determine the type of information put in the output report.

If no options are specified, no information is written out. You must provide at least one option to have something in the output report.

In the output, the following information is printed for the whole design:

- * zero wire delay based negative slack paths
- * bottleneck cells
- * virtual in-place optimization timing report

The rest of the report is divided by soft macro or plan group. All the timing environment information related to one soft macro or plan group is printed together.

The **-bottleneck_max_cell** and **-bottleneck_no_vipo** options are ignored if the **-bottleneck** option is not specified.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following command creates a report file, stat.rpt, that contains summary information about budgetable, unbudgetable and total block pins in the design.

```
prompt> check_fp_timing_environment -block_pin_stats > stat.rpt
```

The following command creates a report file, violators.rpt, that contains cell delay violators. The cells are printed if they have a delay of more than 50% of the related clock period.

```
prompt> check_fp_timing_environment -delay_violators 50 > violators.rpt
```

The following example reports block pins that are unconstrained or have timing exceptions on them.

```
prompt> check_fp_timing_environment -unconstrained_pins \
-exception_pins
```

The output has the following format:

```
=====
Plan Group Name: <PG Name>, Master Name: <Reference Name>
=====
```

```
#### Information regarding block pins without constraint or delay information
```

```
Plan Group Port = <port name1>: is not constrained.
```

```
Plan Group Port = <port name2>: is not constrained.
```

```
#### Information regarding blocks pins that are touched by an exception
```

```
Plan Group Port = <port name3>: Port touched by set_false_path exception.
```

```
Plan Group Port = <port name4>: Port touched by set_multicycle_path exception.
```

SEE ALSO

```
allocate_fp_budgets(2)

```

check_isolation_cellsfp

Reports the existing isolation cells in the current design. It also reports if any isolation cell is redundant or might be required.

SYNTAX

```
status check_isolation_cells
[-input]
[-output]
[-inside]
[-outside]
[objects]
```

Data Types

objects list

ARGUMENTS

```
-input
    Checks the isolation cells only on the input nets of the top-level logical
    hierarchies or voltage areas.

-output
    Checks the isolation cells only on the output nets of the top-level logical
    hierarchies or voltage areas.

-inside
    Checks the isolation cells that are inside the top-level logical hierarchies
    or voltage areas.

-outside
    Checks the isolation cells that are outside the top-level logical hierarchies
    or voltage areas.

objects
    Specifies a list of voltage areas (in physical context) or top-level logical
    hierarchies (in logical context) that are for which the query is run.
```

DESCRIPTION

The **check_isolation_cells** command reports the isolation cells that are associated with the top-level logical hierarchies or voltage areas in the design. The top-level logical hierarchies can be given as inputs only from dc_shell and voltage areas can be given as inputs only from psyn_shell.

This command also reports if there are possible redundant isolation cells in the design. When in dc_shell, this command reports about the possible requirement of an isolation cell on a net if that net crosses two logical hierarchies without any isolation cell. In psyn_shell, if a net is sourced in a voltage area and sunked into another, the command reports that there might be a requirement of an isolation cell

on that net.

If no logical hierarchies are given in this command in dc_shell, the command looks all of the top-level logical hierarchies and reports on the isolation cells based upon the given switches.

In psyn_shell, if no voltage areas are specified, the command looks at all existing voltage areas, except the default voltage area, and reports about the isolation cells according to the given switches. The command does not accept default voltage area as an input from psyn_shell.

This command works both for multisupply and multivoltage designs. In the case of a multivoltage design, this command treats enabled level shifter cells also as isolation cells.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example report from the **check_isolation_cells** command:

```
prompt> check_isolation_cells
*****
Information : Output vdd_region_2/state_out[31] has an isolation cell
state_out_iso31 outside vdd_region_2
Information : Output vdd_region_2/state_out[30] has an isolation cell
state_out_iso30 outside vdd_region_2
Information : Output vdd_region_2/state_out[29] has an isolation cell
state_out_iso29 outside vdd_region_2
Information : Output vdd_region_2/state_out[28] has an isolation cell
state_out_iso28 outside vdd_region_2
Information : Output vdd_region_2/state_out[27] has an isolation cell
state_out_iso27 outside vdd_region_2
Information : Output vdd_region_2/state_out[26] has an isolation cell
state_out_iso26 outside vdd_region_2
Information : Output vdd_region_2/state_out[25] has an isolation cell
state_out_iso25 outside vdd_region_2
Information : Output vdd_region_2/state_out[24] has an isolation cell
state_out_iso24 outside vdd_region_2
Information : Output vdd_region_2/state_out[23] has an isolation cell

check_level_shifters(2)
check_library(2)

check_legality

Checks the legality of the current placement.

SYNTAX

```
int check_legality
[-verbose]
```

ARGUMENTS

-verbose

Prints a detailed report of all possible violations. Without this option, only a summary of all violations is printed.

DESCRIPTION

The **check_legality** command checks the legality of current placement, and prints out a report of statistics about violations. The violations can be classified as:

1. Cells that are not on rows.
2. Cells overlapping each other.
3. Cells overlapping with blockages in the design.
4. Cells with orientation that is not allowed for the row on which a cell is placed.
5. Cells with a core site type not equal to that of the row on which cells are placed.
6. Cells overlapping with power straps in the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the command for printing out a summary of all violations.

```
prompt> check_legality
```

SEE ALSO

```
create_placement(2)
legalize_placement(2)
```

check_level_shifters

Checks the design for all existing level shifters and nets against the specified level shifter strategy and threshold.

SYNTAX

```
status check_level_shifters
[-verbose]
```

ARGUMENTS

-verbose

Prints a detailed report of all possible violations. By default, only a summary of all violations is printed.

DESCRIPTION

This command checks the design for all existing level shifters and nets against the specified level shifter strategy and threshold. It prints out complete statistics of the design regarding existing and required voltage adjustments containing the following information:

- Level shifter strategy and threshold
- Nets that need level shifters
- Nets that need level shifters but are dont_touched
- Nets that have multiple driver pins at different operating voltages
- Total number of level shifters in the design
- Total number of violating level shifters in the design
- Total number of violating nets in the design.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example prints out a summary of all violations:

```
prompt> check_level_shifters
```

```
*****
Check Level Shifters and Nets Summary
*****
Level shifter strategy :low_to_high
Level shifter threshold voltage :0
Level shifter threshold percent :0
Number of violating nets (dont_touch) :2
Number of violating nets (multiple driver) :0
Number of violating nets (total) :2
Number of violating level shifters :32
*****
```

The following example shows the command with verbose option:

```
prompt> check_level_shifters -v
```

```
-----

```

check_library

Performs consistency checks between logic and physical libraries, cross logic libraries, and intra-physical libraries.

SYNTAX

```
status check_library
[-mw_library_name phys_library_name_list]
[-logic_library_name logic_library_name_list]
[-cells cell_list]
```

Data Types

<i>phys_library_name_list</i>	list
<i>logic_library_name_list</i>	list
<i>cell_list</i>	list

ARGUMENTS

-mw_library_name *phys_library_name_list*

Specifies Milkyway reference library names to be checked. By default, the reference libraries set by the **mw_reference_library** variable are checked. Use the main or design library to check for technical consistency and cells of the same name in physical libraries.

-logic_library_name *logic_library_name_list*

Specifies logic library file names to be checked. By default, the link libraries set by the **link_library** variable are checked. For logic versus. logic library checking, this option specifies two or more libraries; for example, minimum and maximum libraries. If the **-logic_library_name** option is not explicitly specified but **set_min_library max_library** is specified, the command checks the minimum and maximum libraries as a pair. If neither **-logic_library_name** nor maximum and minimum libraries are specified, but **link_library** and **search_path** are set, the command first groups the libraries in the list by cell set, and within each group or family the command checks consistencies across all libraries in the same group. Libraries without grouping, that is, libraries that cannot be paired, are not checked. For **-scaling**, specify the scaling libraries by **-logic_library_name** option that are defined in **define_scaling_lib_group**, or specify them by **define_scaling_lib_group** command. If **-logic_library_name**, **set_min_library**, **define_scaling_lib_group** and **\$link_library** are all specified, the priority order is also this sequence with **-logic_library_name** the highest. For **-compare** and **-validate**, specify only two libraries. This option is ignored for physical library checking.

-cells *cell_list*

Specifies a list of cell names to be checked. If not specified, all cells in the libraries are checked.

DESCRIPTION

The **check_library** command checks and reports the items described below, based on the settings of the **set_check_library_options** command.

This command checks library qualities in three main areas:

- Physical library quality
- Logic versus physical library consistency
- Logic versus logic consistency.

The command performs the following consistency checks between logic and physical libraries:

- Missing cells in the logic or physical library
- Missing or mismatched pins (pin names, directions, and types) in the logic and physical library. Note that the pin direction keyword *input* in a logic cell versus *Input* in a physical cell is not a mismatch.
- Area values of each standard cell between .lib/.db model and FRAM view (PRBoundary and CellBoundary)
- Cell footprint (**cell_footprint** attribute)
- Bus character naming style in logic and physical libraries.

Physical library qualities are checked as follows:

- Technology data consistency between the specified main library and each linked reference library
- Cell view versus FRAM view in the library for missing views and mismatched views
- Cells with identical names in different reference libraries and the specified main library
- Signal EM rule
- Antenna rules and missing antenna properties
- Rectilinear cells
- Physical-only cells
- Physical properties for place and route including unit tiles for the libraries
- Pin routability

- Technology data quality
- DRC for each cell in the library.

By default, missing cells and pins, and mismatched pins are checked.

Logic versus logic library consistency checks include:

- General checking at library, cell, pin and timing group levels: Missing cells, missing and mismatched pins or pg_pins and timing arcs.
- Special checking for timing, noise and power scaling
- Special checking for UPF/MV flow (pg_pin, power management cells and power data etc.)
- Special checking for MCMM flow (operating conditions and power_down_function, etc.)
- Library characterization and validation.

All of the checking functions are available in both IC Compiler and Design Compiler, and the functions of logic versus logic library checking are also available in Library Compiler. If multiple logic libraries are specified for default checking, and if no cells are found in any of the libraries that match the physical library, the cells are counted as missing in the logic library unless these are physical-only cells. Otherwise, if the cells are found in any of the logic libraries, such as the first library, they are counted as consistent in cell names.

If no libraries are specified by the **-mw_library_name** and **-logic_library_name** options, the command checks logic versus physical libraries that are already set up for the design by the **mw_reference_library** and **link_library** variables. If there is no design set up, the command does not perform any checks.

Explicitly specified libraries will override the defaults. If both physical and logic libraries are specified, no design library is required. However, if a design library is open, the explicitly specified libraries in **check_library** are checked and the libraries in the design are ignored.

Specify a design library when checking cells of the same name and technical consistency in Milkyway libraries. To check logic versus physical libraries for the current design, use the **set search_path**, **set link_library**, **set mw_reference_library**, or **open_mw_lib** command to set the libraries to be checked before issuing **check_library**. For logic versus physical library checking, at the end of checking, the command reports a cross-check summary that includes the following:

- Number of cells missing in the logic library (excluding physical-only cells)
- Number of cells missing in the physical library
- Number of cells with missing or mismatched pins in libraries, if any
- The logic versus physical library quality checking PASSED, or Logic library is INCONSISTENT with the physical library.

For logic versus logic library checking, at the end of checking, the command reports

a summary for each specified option. For example, for -mcmm, it reports:
Logic library consistency check FAILED for MCMM.

Use **check_library** before reading in a design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In the following example, the lib1.db and lib2.db logic libraries are checked against the phys_lib physical libraries for missing cells and pins, mismatched pins, the cell footprint and bus delimiter.

```
prompt> set_check_library_options -cell_footprint -bus_delimiter
1

prompt> check_library -mw_library_name {phys_lib} \
      -logic_library_name {lib1.db lib2.db}
1

```

check_license

Checks the availability of a license for a feature.

SYNTAX

```
status check_license  
feature_list
```

Data Types

```
feature_list      list
```

ARGUMENTS

feature_list

Specifies the list of features to be checked. If more than one feature is specified, they must be enclosed in braces ({}). By looking at your key file, you can determine all of the features licensed at your site.

DESCRIPTION

This command checks on a license for the named features. It does not check out the license.

The **list_licenses** command provides a list of the features that you are currently using.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example checks on the license for the multivoltage feature:

```
prompt> check_license {Galaxy-MV}
```

SEE ALSO

```
get_license(2)  
license_users(2)  
list_licenses(2)  
remove_license(2)
```

check_mpc

Checks the result of the minimum physical constraints options on the design after running the design through the minimum physical constraints flow.

SYNTAX

```
int check_mpc
[-macros]
[-ports]
[-conflicting]
[-verbose]
[object_list]
```

Data Types

object_list collection or list

ARGUMENTS

-macros
Checks the constraints for macro objects only. Set the constraints with the **set_mpc_macro_options** command and the **set_mpc_macro_array** command.

-ports
Checks the constraints for port objects only. Set the constraints with the **set_mpc_port_options** command.

-conflicting
Reports only the conflicting constraints, such as constraints that are failing.

-verbose
Includes the values used to check the minimum physical constraints against the final placement in the report. This option produces a more detailed than without the switch.

object_list
Specifies a list of designs, macros, ports, or group_names that are specified in the design.

DESCRIPTION

The **check_mpc** command verifies the design level physical constraints against the actual floorplan created after the minimum physical constraints flow, which consists of the **create_placement -mpc**, **compile_physical -mpc**, and the **physopt -mpc** flows. Use **check_mpc** to verify and debug the constraints, and to determine if any constraints were or were not met and the reason why.

The constraints and the actual floorplan are read in from the .db file.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

After reading in a .db file that contains the constraints and placement information, you can check the constraints on the *current_design*, as shown in the following example:

```
prompt> check_mpc [current_design]
Current design is 'MRISC'.
set_mpc_options
  -aspect_ratio      1.500          1.510        Not Met
  -left_port_limit   10             10           Met
  -right_port_limit  10             10           Met
  -top_port_limit    10             10           Met
  -bottom_port_limit 100            67           Met
  -min_port_pitch    1              560          Met
1
```

The following example checks the constraints on port objects only:

```
prompt> check_mpc -port
set_mpc_port_options  Instrn[8]
  -side               top            top          Met
set_mpc_port_options  Instrn[7]
  -side               top            top          Met
set_mpc_port_options  Instrn[6]
  -side               top            top          Met
1
```

The following example checks constraints on macro objects only:

```
prompt> check_mpc -macro
set_mpc_macro_options I_MBOX_QTM_core1
  -legal_orientations N S FN FS          N           Met
  -anchor_bound       r                  (215.520 176.360 315.520 276.360) Met
  -x_offset           2.000            2.000        Met
  -align_pins         {PSW[10] Y[0]}      Met
set_mpc_macro_options I_MBOX_QTM_core2
  -legal_orientations N S FN FS          N           Met
  -anchor_bound       t                  (3.170 376.360 103.170 476.360) Met
  -y_offset           3.000            3.000        Met
1
```

The following example includes the values used to check the minimum physical constraints of the I_MBOX_QRT_core1 object against the final placement in the report:

```

prompt> check_mpc -verbose I_MBOX_QTM_core1
set_mpc_macro_options           I_MBOX_QTM_core1
-legal_orientations   N S FN FS          N          Met
-anchor_bound         r                  (215.520 176.360 315.520 276.360) Met
The Bound for this region 'r' is [215.520 0.000 315.520 479.360]
-x_offset            2.000            2.000            Met
-align_pins          {PSW[10] Y[0]}        Met
The location of the pin Y[0] on macro I_MBOX_QTM_core1 is {315.020 196.860}
The location of the port PSW[10] is {317.380 196.840}
1

```

The following examples show how run **check_mpc** on specific object lists:

```

prompt> check_mpc [all_macro_cells]

prompt> check_mpc [get_ports ALL_OUTS*]

prompt> check_mpc -verbose

prompt> check_mpc [list [current_design] [get_ports In*]] \
      [all_macro_cells]

```

```

check_mv_design

Checks for violations in a multivoltage design.

SYNTAX

```
status check_mv_design
[-verbose]
[-isolation]
[-target_library_subset]
[-opcond_mismatches]
[-connection_rules]
[-level_shifters]
[-power_nets]
[-max_messages message_count]
```

Data Types

message_count unsigned integer

ARGUMENTS

-verbose

Reports violations in the design in detail. If this option is not specified, the command provides only a summary of the violations.

-isolation

Reports electrical isolation requirements on nets connecting power domains. This option enforces the following checks:

- Nets that require isolation but on which the isolation cell is missing
- Nets that do not require isolation but for which an isolation cell is added
- Isolation cells that do not cross power domain boundaries.

-target_library_subset

Checks inconsistent settings between the target library, target library subset, and operating conditions. This option enforces the following checks:

- Conflicts between the target library subset and the global **target_library** variable. The target library subset should be a subset of the library set specified by the **target_library** variable.
- Conflicts between the operating condition and target library subset. There should be at least one library from the target library subset that has the same process, voltage, and temperature as the operating condition being used on a block.
- Conflicts between a cell and target library subset specification on the parent design of the cell. This check ensures that cells from the specified target library subset are used.

-opcond_mismatches

Reports on technology cells instantiated in the design with incompatible operating conditions. The option checks for conflicts between a cell and the operating condition specified on the parent design of the cell. This check ensures that the operating condition at which the cell is characterized matches the operating condition specified on the design.

-connection_rules

Reports violations in always-on synthesis and pass gate connections. The option enforces the following checks:

- Always-on net driven by a normal cell
- Always-on net or a net from an always-on domain driving the pass gate
- Always-on cell driving normal net
- Two pass gates connected to each other.

-level_shifters

Reports level shifter related violations. The following types of violations are reported:

- Nets with missing level shifters
- Nets on which the level shifter cannot be added because either the nets are marked dont touch or the nets are driven by pins operating at different voltages.
- Level shifter cells shifting incorrect voltage differences
- Level shifters with an input pin driven by pins operating at different voltages
- Level shifters with an output pin driving pins operating at different voltages
- Level shifters that violate level shifter strategy settings.

-power_nets

Reports on power and ground pin connections. The report provides the following information:

- Mismatches of power and ground pins between logical libraries and FRAM libraries
- Power and ground connection summary
- Power and ground pins whose connection cannot be derived and why the derivation fails.
- Power and ground pins whose existing connection does not match with the derived connection from the power domains. This failure for power and ground pins may be caused by any of the following:
 - Unknown power pin type indicates either the power pin does not have a type

or the pin has a type without connection semantics. The automatic power connection supports the following power pin types: primary_power_pin, primary_ground_pin, backup_power_pin, backup_ground_pin, internal_power_pin, and internal_ground_pin.

- Invalid pin type for the cell or the cell's power domain indicates that the cell's power domain does not have a power net connection with the matching type for the power pin type. For example, a backup ground pin of a regular cell will have such an issue if the cell's power domain does not have a backup ground net connection.
- No signal pin that uses this pin as related_power_pin/related_ground_pin occurs only on level shifters or isolation cells. The power connection of a power pin on level shifters or isolation cells is obtained through tracing cells connected to related signal pins of the power pin. The power connection fails if a power pin has no related signal pin; such as if no signal pin uses the power pin as related_power_pin or related_ground_pin in the logical library cell definition.
- Cells connected to the related signal pins of the LS/ISO cell requiring different P/G nets: occurs only on level shifters or isolation cells. The tool cannot derive a proper power net for a given pin because different nets are needed for the same pin based on cells connected to related signal pins.
- Back-to-back connection of LS/ISO cells occurs when a level shifter or isolation cell is directly connected to another level shifter or isolation cell. The automatic connection of a power pin on such level shifters or isolation cells may fail if the tracing of related signal connections reaches only other level shifters or isolation cells.

The above issues can be resolved using the **connect_power_net_info** command.

-max_messages message_count

Sets the limit on the number of messages printed in the log file.

DESCRIPTION

The **check_mv_design** command checks the design, multivoltage constraints, electrical isolation requirements, and connection rules, and issues error and warning messages as appropriate.

The checker options can be combined to adjust the verbosity of the final report. If the command is specified without a checker option, a summary of all violations is reported.

If the **-verbose** option is specified, details of all violations are reported. The **-max_messages** option reports a specified number of violations. When other checker options are specified, the message count specified by **-max_messages** applies to each checker. If a checker is not specified, the message count is used to limit the number of messages printed by all checkers. If **-max_messages** is not specified, the command prints all messages.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following command prints all violations in the design:

```
prompt> check_mv_design -verbose
```

```
-----  
Target Library Subset Checks  
-----
```

No Errors/Warnings Found.

```
-----  
Power Domain Checks  
-----
```

Warning: Isolation cell is required on net A_INST/OUTPUT connecting A_INST and B_INST. (MV-042)

Warning: Isolation cell is required on net B_INST/OUTPUT connecting B_INST and top. (MV-042)

Warning: Isolation cell A_INST/isol is used to isolate a net that is not crossing power domain boundary. (MV-044)

```
-----  
Power Domain Checks Summary  
-----
```

Warning: Found 2 net(s) without isolation. (MV-046)

Warning: Found 1 isolation cell(s) on net(s) not crossing power domain boundaries. (MV-048)

```
-----  
Cell Operating Condition Checks  
-----
```

No Errors/Warnings Found.

```
-----  
Power Domain and Operating Condition Consistency Checks  
-----
```

No Errors/Warnings Found.

The following command prints a summary of all violations in the design:

```
prompt> check_mv_design
```

```
-----  
Target Library Subset Checks  
-----
```

No Errors/Warnings Found.

Power Domain Checks

Warning: Found 2 net(s) without isolation. (MV-046)

Warning: Found 1 isolation cell(s) on net(s) not crossing power domain boundaries. (MV-048)

Cell Operating Condition Checks

No Errors/Warnings Found.

Power Domain and Operating Condition Consistency Checks

No Errors/Warnings Found.

The following command prints violations related to electrical isolation:

```
prompt> check_mv_design -verbose -isolation
```

Power Domain Checks

Warning: Isolation cell is required on net A_INST/OUTPUT connecting A_INST and B_INST. (MV-042)

Warning: Isolation cell is required on net B_INST/OUTPUT connecting B_INST and top. (MV-042)

Warning: Isolation cell A_INST/isol is used to isolate a net that is not crossing power domain boundary. (MV-044)

Power Domain Checks Summary

Warning: Found 2 net(s) without isolation. (MV-046)

Warning: Found 1 isolation cell(s) on net(s) not crossing power domain boundaries. (MV-048)

SEE ALSO

`check_library(2)`
`remove_target_library_subset(2)`
`set_target_library_subset(2)`

check_noise

Checks whether there are necessary data available to run noise analysis in the current design.

SYNTAX

```
status check_noise
[-verbose]
[-nosplit]
[-include check_list]
```

Data Types

check_list list

ARGUMENTS

```
-verbose
    Enables verbose mode showing detailed information and pin names.

-nosplit
    Most of the design information is listed in fixed-width columns. If the
    information in a given field exceeds the column width, the next field begins
    on a new line, starting in the correct column. The -nosplit option prevents
    line-splitting and facilitates writing software to extract information from
    the report output.

-include check_list
    Specifies the types of checking. Available values are noise_driver and
    noise_immunity. The default is noise_immunity.
```

DESCRIPTION

It is possible to have invalid noise models in a library and run noise analysis without detecting them. This may result in inaccurate results. If the design is large, and it takes long time to finish the noise analysis, it will also cause longer turn around time. Moreover, it is very important that all pins in the design have correct noise immunity information. Otherwise, when the noise analysis is over, violations wouldn't be reported even if noise bumps are large enough to create violations.

The check_noise is a command that can be executed before the noise analysis to validate the correctness of a design with respect to the noise analysis. It checks any invalid noise model, any pin without a model from the library and the design. It checks if all pins in the design are 'noise constrained', i.e., their noise immunity can be calculated.

In a verbose mode, the command will show cell and pin names that have no model or invalid models.

EXAMPLES

The following example shows noise immunity check:

```
prompt> check_noise
Information: Checking noise immunity on load pins...

Noise immunity type above_low below_high -----
----- library immunity table 0 0 library immunity curve 0 0 library CCS
noise immunity 3245 3245 global threshold 0 0
```

The following example shows noise driver check:

```
prompt> check_noise -include {noise_driver}
Information: Checking noise models on driver pins...

Noise driver type above_low below_high -----
----- library set iv curve 0 0 library set CCS noise 520 520 estimation set
value 0 0
```

SEE ALSO

`report_noise(2)`

check_physical_constraints

Checks the physical constraints and provides feedback about possible errors in input.

SYNTAX

```
int check_physical_constraints
[-narrow_placement_area no_of_sites]
[-rc_check rc_variation_margin]
[-verbose]
[-analyze_legality [-nworst no_of_worst_cells]
[-design]
[-lib_cell lib_cell_name]]
```

Data Types

<i>no_of_sites</i>	integer
<i>rc_variation_margin</i>	float
<i>no_of_worst_cells</i>	integer
<i>lib_cell_name</i>	string

ARGUMENTS

-narrow_placement_area no_of_sites

Issues warnings about narrow placement areas in the floorplan. It is defined in terms of base site widths. The default is the maximum width of the cells in the library. Using a value of 0 for this switch causes the narrow placement area check to be skipped. The narrow placement area threshold width is same for both the vertical and the horizontal direction.

-rc_check rc_variation_margin

Issues warnings if the resistance or capacitance varies by more than the *rc_variation_margin* across different metal layers. This option detects invalid layers, such as POLY. However, such a variation is possible because of differing metal widths in different layers. Also checks for width, pitch, and spacing for all route metal layers. Default is 5.0. Note that *rc_variation_margin* value is a multiplier and not an absolute value.

-verbose

Prints more information. When used with the **-analyze_legality** switch, it prints the legal site rates for each library cell and the reason for non-legal sites.

-analyze_legality

Analyzes each cell of a physical library against a floorplan (with power structures) and reports the success rate for legalization on all sites. The legal rate printed prints the legal sites for the library cell after evaluating them against the power straps. It shows the total number of available sites for the library cell so you can determine whether or not you want to use that cell. Default is off.

```
-nworst no_of_worst_cells
    Prints no_of_worst_cells for all cells in the physical library in terms of
    legal site rates. This is the default mode of the -analyze_legality switch.
    If it is used with -verbose or -lib_cell, it is ignored. This option is only
    used with -analyze_legality. Default is 10.

-design
    Performs -analyze_legality on the library cells that are in design only.
    Default is false.

-lib_cell lib_cell_name
    Specifies a particular library cell for -analyze_legality.
```

DESCRIPTION

The **check_physical_constraints** command checks several physical constraints and provide information about possible errors in input. It checks for cell areas in hard bound, correct layers in the library against those in the floorplan, resistance and capacitance for different route layers, narrow placement areas in the floorplan, legal sites for library cells in floorplan, etc. Check all of the warnings and error messages to avoid erroneous input to the tool. Use this command early in the flow to detect errors in input.

Refer to the **-check_only** option to the **physopt** for further information.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example checks the physical constraints. The *rc_variation_margin* is 2.1.

```
prompt> check_physical_constraints -verbose -rc_check 2.1
```

SEE ALSO

`report_placement_utilization(2)`

check_physical_design

Checks the readiness of the current design for IC Compiler.

SYNTAX

```
status check_physical_design
  -stage stage_value | -input_log log_file
  [-output directory]
  [-display]
```

Data Types

<i>stage_value</i>	string
<i>log_file</i>	string
<i>directory</i>	string

ARGUMENTS

-stage *stage_value*

Specifies which stage to check. The checks performed by the **check_physical_design** command depend on the specified stage. Make sure the design contents make sense for the specified stage; otherwise, the report might be meaningless.

You can specify one of the following values:

- * **pre_place_opt**

This stage requires that the floorplan and netlist data are ready and the design constraints are set.

- * **pre_clock_opt**

This stage requires the same items as pre_place_opt. In addition, the design must be placed and clock constraints must be set.

- * **pre_route_opt**

This stage should be called when the design is ready for routing.

You must specify either this option or the **-input_log** option.

-input_log *log_file*

Specifies the log file to analyze. When you specify this option, the command only analyzes the specified log file; it does not invoke special checks.

You must specify either this option or the **-stage** option.

-output *directory*

Specifies the the directory in which to save the report.

By default, the report is saved in a directory called

cpd_<stage>_<time>_<pid>. The generated HTML report is called index.html.

If the specified directory already exists, a unique directory named *directory.n* is created and used.

-display

Displays the result in the Web browser defined by the **gui_online_browser**

variable.

DESCRIPTION

The **check_physical_design** command checks the readiness of the current design for IC Compiler. It performs specific checks and analysis based on the specified options. If you specify the **-input_log** option, the tool skips the checking and analyzes the specified log file instead.

If you do not specify the **-input_log** option, you must load the floorplan and open the Milkyway design before running the command; otherwise, the checking will not work. In addition, some of the checks require the CEL view to be writable.

This command analyzes and reports all the error messages and other customizable messages from the checking result (or the input log file specified by the **-input_log** option) and provides the final report in an easy-to-use HTML format. The HTML file contains information about what to do next, hyperlinks to man pages, and the line number in the log file for each message. The command supports Web browsers such as Internet Explorer and Firefox. By default, this command tries to open the result in the Web browser.

Configuration File

You can customize the behavior of the **check_physical_design** command by using a configuration file, which is called `.icc_report_config`. The tool looks for this file in your home directory and the current working directory. Settings in the configuration file in the current working directory override those in the configuration file in your home directory.

The configuration file can contain the following commands:

`set maxMessageCount integer` This variable controls how many detailed messages are displayed for the same message ID in the HTML file. The default is 10.

`set linkToLogMode integer` This variable controls the algorithm used to link the log file in the HTML file. If set to 0, the HTML file uses JavaScript to automatically generate the partial log file and highlights the desired message line when you click on the hyperlink to the log file. If set to 1, multiple partial log files are generated disk during command execution and the links point directly to the saved files. A setting of 1 has a small runtime and disk space penalty, due to saving extra files on disk, but the speed of opening the links should be better than with a setting of 0. If your browser does not support JavaScript inside the HTML, use a setting of 1. The default is 0.

`add_keyword keyword` This command allows you to specify keywords that you want the tool to be aware of. The tool creates an HTML table with the results of "grepping" for this keyword. When you use this setting, your operating system path must be set up so that it can directly find the grep command.

`config_message options` This command defines how the **check_physical_design** command treats messages during analysis. Note that error messages are always considered important messages.

The supported options for the **config_message** command are:

- * **-id message_id**
Specifies the message ID which will be reconfigured.
- * **-title message_id_title**
Specifies the title of the message, which is displayed in the HTML table.
- * **-ignore**
Specifies that the **check_physical_design** command should treat this message ID as an unimportant message.
- * **-stage stage_name**
Specifies the stage to which this configuration applies. If not specified, the configuration applies to all stages. This option allows you to treat the same message differently at different stages. For example, you can define the messages from checking ideal clock nets as unimportant at the pre_clock_opt stage, but define them as important at the pre_route stage.

config_check options This command adds user-defined checks to the **check_physical_design** command. The checks are executed one by one after the embedded checks.

The supported options for the **config_check** command are

- * **-cmd tcl_procedure_name**
Specifies the Tcl procedure that contains the user-defined check.
- * **-stage stage_name**
Specifies the stage to which this configuration applies. If not specified, the configuration applies to all stages. This option allows you to add the same check at different stages.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example checks the design readiness for placement and saves the result in the cpd_result directory. The log file lists the checks that were performed and the result summary. An HTML file is also generated, which you can read using the Web browser.

```
prompt> check_physical_design -stage pre_place_opt -output cpd_result
checking tluplus...
checking link...
checking logic objects...
```

```

checking physical objects...
checking timing...
checking HFN/ideal/dont_touch nets...
checking placement constraints...

dump check_physical_design result to file cpd_result/index.html  

1  

prompt> sh firefox cpd_result/index.html

```

The following example analyzes the results in the pre_place_log log file. It does not perform checks on the design.

```
prompt> check_physical_design -input_log pre_place_log
```

The following example shows a sample configuration file:

```

add_keyword drc
config_message -stage pre_clock_opt -id CTS-810 -ignore
config_check -stage pre_clock_opt -cmd "report_design -physical"
set maxMessageCount 5

```

print_suppressed_messages(2)
suppress_message(2)
unsuppress_message(2)
gui_online_browser(3)
```

check_route

Checks and reports the violations of a routed design.

SYNTAX

```
status check_route
[-drc]
[-opens]
[-antenna]
[-top_layer_probe_constraints]
[-num_cpus num]
```

ARGUMENTS

```
-drc
    Check DRC Violations.

-opens
    Check Opens.

-antenna
    Check Charge-Collecting Antenna violations.

-top_layer_probe_constraints
    Check Top-Layer Probe Constraints.

-num_cpus num
    Number of cpus for DRC checking. Number must be >= 1.
```

DESCRIPTION

This command checks and reports the following about a routed design: DRC Violations, Opens, Charge-Collecting Antenna violations and Top-Layer Probe Constraints. Design rule checking can also be done using the Distributed Routing option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> check_route -drc
```

SEE ALSO

check_routeability

Verifies that the current design is routeable.

SYNTAX

```
integer check_routeability
[-error_cell cell_name]
```

ARGUMENTS

-error_cell *cell_name*

Enter the error cell you want or use the default name provided. The default name is <top_cell_name>.err. When there are errors in the design, an error cell is generated with this given name. An error cell will not be generated unless errors exist.

DESCRIPTION

Checks pin access points, cell instance wire tracks, pin out of boundaries, min-grid and pin design rules and blockages to ensure they meet the design requirements. It performs a check of the design for optimization in order to substantiate any errors in the design that might need to be fixed or what could help to improve the design. This must currently be run on a placed design.

You can use this command at every stage between placement and detail routing. Verify errors in the generated error cell or log file.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example dump out the design error to a specified file, dumpErr.err.

```
prompt> check_routeability -error_cell dumpErr.err
```

The following example dump out the design error to a default cell.

```
prompt> check_routeability
```

SEE ALSO

`create_route_guide(2)`

check_rp_groups

Checks the relative placement constraints and reports the failures.

SYNTAX

```
collection check_rp_groups
{rp_groups | -all}
[-output filename]
[-verbose]
```

Data Types

<i>rp_groups</i>	list or collection
<i>filename</i>	string

ARGUMENTS

rp_groups

Specifies the relative placement groups that will be checked for failures.
This option and the **-all** option are mutually exclusive.

-all

Specifies that all relative placement groups will be checked.
This option and the *rp_groups* argument are mutually exclusive.

-output *filename*

Specifies the name of the output file for the report.
If you do not specify this option, the report is written to the standard output.

-verbose

Reports all possible relative placement failures in the design.

DESCRIPTION

The **check_rp_groups** command checks for and reports any relative placement failures in the specified groups. This command is supported only for designs that do not contain multiply instantiated designs.

The command returns a collection containing the relative placement groups that are checked. If no groups are checked, the empty string is returned.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples use **check_rp_groups** to check for relative placement failures:

```
prompt> get_rp_groups
{compare:::g1 compare:::g2 compare:::g4 compare:::g7}

prompt> check_rp_groups -all -out failures
{compare:::g7 compare:::g4 compare:::g2 compare:::g1}

prompt> check_rp_groups compare:::g4 -out g4_failures
{compare:::g4}

prompt> check_rp_groups compare:::g4

*****

check_scan_chain

Allows scan chain structural consistency checking based on the scan chain information stored in the current design.

SYNTAX

```
status check_scan_chain
[-chain_name name of the scan chain string]
```

ARGUMENTS

DESCRIPTION

This command performs a scan chain structural checking based on the scan chain information stored in the current CEL. If the scan chain passes all the structural checks, then the scan chain status is "VALIDATED"/V and is physically design-for-test (DFT) optimized. If the scan chain fails the structural checks then the scan chain status is "FAILED"/F and is not physically optimized.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example checks for scan chain structural consistency.

```
prompt> check_scan_chain
Checking SCANDEF...
Checking scan cell correspondence between SCANDEF and netlist...
Checking scan chain checking...
All checks completed.
```

```
*****

check_target_library_subset

Checks and prints out the inconsistent settings among target library, target library subset, and operating conditions.

SYNTAX

```
status check_target_library_subset
```

ARGUMENTS

The **check_target_library_subset** command has no arguments.

DESCRIPTION

This command checks and prints out the inconsistent settings among target library, target library subset, and operating conditions. It checks the following:

- Conflicts between the target library subset and the global target_library variable. Target library subset should be a subset of the library set being specified by the target_library variable.
- Conflicts between operating condition and target library subset. There should be at least one library from the target library subset that has the same process, nom_voltage, and temperature as the operating condition being used on that block.
- Conflicts between the library cell of the mapped cell and target library subset. Gives a warning if the library cell of a mapped cell is not from any of the libraries of the target library subset. Note that this is not an error, because the subset applies only to new cells being created during optimization, not to existing cells in the block.

Multicorner-Multimode Support

Depending on the options used, this command either uses the current scenario or has no dependency on scenario-specific information.

SEE ALSO

```
check_library(2)
remove_target_library_subset(2)
report_target_library_subset(2)
set_operating_conditions(2)
set_target_library_subset(2)
target_library(3)
```

check_timing

Checks for possible timing problems in the current design.

SYNTAX

```
status check_timing
[-overlap_tolerance minimum_distance]
[-override_defaults check_list]
[-multiple_clock]
[-retain]
[-include check_list]
[-exclude check_list]
```

Data Types

<i>minimum_distance</i>	float
<i>check_list</i>	list

ARGUMENTS

-overlap_tolerance *minimum_distance*

Specifies the minimum distance allowed between the master close edge and the slave open edge. If the distance is less than this value, the tool issues a warning. Use this option to check for the master-slave clock overlap. By default, this option is off.

-override_defaults *check_list*

Overrides the checks in *timing_check_defaults* by using the argument specified in *check_list*. If the **-override_defaults** option is used with a check list, the final list of checks to be performed is the one in the *check_list* argument of the **-override_defaults** option.

-multiple_clock

Issues a warning when multiple clocks reach a register clock pin. If more than one clock signal reaches a register clock pin, and the **timing_enable_multiple_clocks_per_reg** variable is set to false, then the clock to use for analysis is undefined, and the tool generates a warning message. In this case, use either the **set_case_analysis** or **set_disable_timing** command so that only one clock can propagate from the sources to the register clock pin. By default, this option is off.

-retain

Provides a warning if any of the RETAIN values is larger than its corresponding delay value. The RETAIN values should be less than their corresponding delay values so that they can be considered for hold violations. Otherwise, the RETAIN values might be considered for setup violations. By default, this option is off.

-include *check_list*

Adds the checks listed in *check_list* to the checks defined by the **timing_check_defaults** variable.

```
-exclude check_list
    Subtracts the checks listed in check_list from the checks defined by the
    timing_check_defaults variable.
```

DESCRIPTION

This command checks the timing attributes placed on the current design and issues warning messages as needed. The messages provide information that identifies and corrects potential errors. The warnings do not necessarily indicate design problems.

This command without any options performs the checks defined by the **timing_check_defaults** variable. To change the value of the variable, redefine it. If the **-override_defaults** option is not used, the final list of checks to be performed is the list of checks specified by the **timing_check_defaults** variable, plus the list of checks given by the **-include** option, minus the list of checks given by the **-exclude** option. If the **-override_defaults** option is used with a *check_list*, the final list of checks to be performed is the checks in the *check_list* given by the option.

The alphabetically ordered list below shows the meaning of each check:

loops

Warns of combinational feedback loops. If the feedback loop is not broken by the **set_disable_timing** command, it is automatically broken by disabling one or more timing arcs.

no_input_delay

Warns if no clock related delay is specified on an input port, where it propagates to a clocked latch or output port. If the **timing_input_port_default_clock** variable is set to true, a default clock will be assumed for the input port. Otherwise it will not be clocked, and the paths are unconstrained. In this case, if there is no input delay specified, **check_timing** will not generate warnings.

unconstrained_endpoints

Warns about unconstrained timing endpoints. This warning identifies timing endpoints that are not constrained for maximum delay (setup) checks. If the paths to the endpoint are all false paths, endpoints will not be reported as unconstrained endpoints.

generated_clock

Checks the generated clock network. Three types of issues are reported:

- The source pin (master point) is not the clock source.
- The definition point of the generated clock has no path to the source point.
- The generated clocks form a loop.

pulse_clock_cell_type

Warns if an instance cell has a mismatched pulse type defined from its library cell.

clock_crossing

Checks clock interactions when there are multiple clock domains. If a clock

launches one or more paths that are captured by other clocks, it will have an entry in the clock crossing report. If all paths between two clocks are false paths or they are exclusive or asynchronous clocks, the path is marked with an asterisk (*). If only some of the paths are set as false paths, the path is marked by a number sign (#).

data_check_multiple_clock

Warns if multiple clocked signals reach a data check register reference pin. The analysis will be done separately for each of the clocked domains. If the **timing_enable_multiple_clock_per_reg** variable is set to FALSE, only one of the clocked signals will be analyzed.

data_check_no_clock

Warns if no clocked signal reaches a data check register reference pin. In this case, no setup or hold checks are performed on the constrained pin.

multiple_clock

This item should also be specified by the **-multiple_clock** option.

generic

Warns about generic (unmapped) cells in the design. The timing of paths through generic cells is inaccurate because generic cells have zero delay.

gated_clock

Warns about the gated clocks. Disable the gating timing arcs only if the **propagated_clock** attribute is set on that clock.

ideal_timing

Warns user_defined ideal transition or latency is set on a normal pin (not ideal).

retain

This check item should also be specified by the **-retain** option.

clock_no_period

Warns if clocks with no period are specified.

The warning messages that can occur when using this command are described below.

- The warning message shown below occurs when the waveforms applied to a master-slave register are overlapping or have different periods. Use the **create_clock** command to modify one of the waveforms.

The overlap check first determines the intended master-slave waveform relationships based on the ideal clock waveforms. Then the clock network delay and uncertainty is applied to the waveforms and if the distance between the related edges is less than the overlap tolerance, the tool issues a warning.

WARNING: The following master-slave registers have overlapping clock violations. The waveforms or periods may be invalid.

- The warning message shown below identifies timing endpoints (output ports and register data pins) that are not constrained. If the endpoint is a register data pin, use the **create_clock** command for the appropriate clock source to constrain the pin. Use the **set_output_delay** or **set_max_delay** command to constrain output ports.

check_timing

The **set_output_delay** command constrains only the path when the delay is relative to a clock.

WARNING: The following endpoints are not constrained for maximum delay.

- The warning message shown below identifies gated clocks. Disable the gating timing arcs only if the **propagated_clock** attribute is set on that clock.

WARNING: The clock network starting at "clk" is gated by the following input pins. The gating timing arcs might need to be disabled for clocks with the "propagated_clock" attribute.

- The warning message shown below occurs when the design contains unmapped cells (generic logic), which causes the timing of the paths through the generic cells to be inaccurate because generic cells have zero delay.

WARNING: Design "*design_name*" contains unmapped cells.

ideal_clocks

Warns any clock networks that are ideal. Generally, all clocks should be propagated so that the clock network timing is accurately calculated. Especially, in presence of crosstalk, the delay changes induced by other nets on the clock network will not be reflected in the calculated slacks in the design.

no_driving_cell

Warns any port that does not have a driving cell. The warning is issued only when the net connected to the port has parasitic. When no driving cell is specified, that net is assigned a strong driver for modeling aggressor effects, which can be pessimistic. Also, a port with no driving cell could act as a strong victim, which could underestimate the crosstalk effect.

partial_input_delay

Warns any ports have partially defined input delay, only the minimum or only the maximum delay defined with **set_input_delay**. As a result, some paths starting from the port with partially defined input delay may become unconstrained and some potential violations could be missed.

net_no_driving_info

Warns any net that does not have driving pins or there is no timing arcs on the driver pins. The warning is issued only when the net has coupled parasitic.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example checks the timing of the current design and issues warnings as needed:

```
prompt> check_timing

```

check_tlu_plus_files

Checks the files used for TLUPplus extraction.

SYNTAX

```
status check_tlu_plus_files
```

ARGUMENTS

This command has no arguments.

DESCRIPTION

The **check_tlu_plus_files** command invokes consistency checks on the files used for virtual route and post route extraction using TLUPplus. The min and max TLUPplus files were specified with the **set_tlu_plus_files** command. If the tlu+ is from the Milkyway design library attachment, then this command will not do any checking because the attachment should be already checked when it is attached.

The following items are checked for consistency:

layer names

The consistency check ensures that the conductor and via layer names are consistent across the Milkyway, ITF, and mapping files. The tool also checks that the number of layers are consistent among the ITF and Milkyway files. Error messages are printed if there are inconsistencies.

etch values

The tool checks that the etch values in ITF files are consistent with the delta width in Milkyway technology files under min/nom/max conditions, respectively. The signs used to indicate expand and shrink are opposite in ITF files and Milkyway technology files. Warning messages appear if inconsistencies are detected.

min-width and min-spacing

The tool checks that min-width and min-spacing are consistent between ITF files and Milkyway technology files, and among different min/nom/max ITF files. Inconsistencies cause warning messages to be issued.

conductor thickness

The tool checks that the conductor thicknesses are consistent between ITF files and Milkyway technology files. Inconsistencies cause warning messages to be issued.

Multicorner-Multimode Support

This command uses information from both active and inactive scenarios.

EXAMPLES

The following example runs the consistency checks:

```
prompt> check_tlu_plus_files
```

SEE ALSO

```
check_library(2)
set_tlu_plus_files(2)
```

clock_opt

Performs clock tree synthesis, routing of clock nets, extraction, optimization, and hold-time violation fixing on the design. There is also an option to execute interclock delay balancing.

SYNTAX

```
status clock_opt
[-only_psyn]
[-fix_hold_all_clocks]
[-inter_clock_balance]
[-update_clock_latency]
[-operating_condition min | max(default) | min_max]
[-only_cts]
[-optimize_dft]
[-no_clock_route]
[-only_hold_time]
[-area_recovery]
[-size_only]
[-in_place_size_only]
[-power]
```

ARGUMENTS

```
-only_psyn
    Performs optimization only.

-fix_hold_all_clocks
    Executes hold time violation fixing for all clocks. during incremental
    optimization. This option is off by default.

-inter_clock_balance
    Execute interclock delay balancing.

-update_clock_latency
    Updates the latencies on real and virtual clock objects after clock tree
    synthesis, clock tree optimization, interclock balance (if chosen) and clock
    tree detailed routing. This will effectively execute a set_clock_latency
    under-the-hood for the clock objects and use the insertion delay of the clock
    tree as the latency number. If set_latency_adjustment_options command is
    executed before clock_opt, then the directives will be obeyed. If no
    directives are given, then only the latencies of real clock objects will be
    update. The update mechanism uses the insertion delay of the clock tree as
    the latency number.

-operating_condition [min | max(default) | min_max]
    Specify operating condition, default is max.

-only_cts
    Perform CTS, CTO and clock routing.
```

-optimize_dft
 Enables clock-aware scan reordering. The reordering aims to minimize the number of buffer crossings in the scan chain. Minimize the number of buffer crossings can reduce hold time violations in the scan chain. For best results you should first use place_opt -optimize_dft to perform placement aware scan reordering.

-no_clock_route
 Don't perform clock routing of clock nets.

-only_hold_time
 Perform hold time fixing only after CTS. If -fix_hold_all_clocks is specified, we will fix hold for all clocks. Otherwise, we only fix hold time violations for user specified hold time fix clocks.

-area_recovery
 Enables area recovery for the cells not on the timing critical paths. By default, this option is off.

-size_only
 Restricts post CTS optimization to sizing changes only. Optimization tricks that insert new cells and remove cells are disabled. The **-size_only** and **-in_place_size_only** options are mutually exclusive. See the description for the **-in_place_size_only** option for additional information on how to constrain sizing changes more.

-in_place_size_only
 Restricts post CTS optimization to sizing changes only. Optimization procedures that insert new cells and remove cells are disabled. With the **-in_place_size_only** option, sizing changes are further constrained for minimal engineering change order (ECO) placement changes. For example, a cell is sized to improve timing or design rule costs only if the newly-sized cell can fit into any available space adjacent to the original cell location. The resulting transformation is verified to ensure it is legal.

-power
 Performs pre or post CTS power optimization in **clock_opt**. The power optimization features are determined by **set_power_options**. During post CTS optimization phase, currently only leakage power optimization is supported. To enable pre CTS power optimization, at least one of **-low_power_placement** and **-clock_gating** must be enabled by **set_power_options**. Detailed options for pre CTS power optimizations are set by **set_optimize_pre_cts_power_options**. When **-low_power_placement** is enabled, switching-activity-based power-aware placement is utilized in an incremental way. For the maximum power optimization performance from this power-aware placement, the same coarse placement setups (e.g. `placer_max_cell_density_threshold`) used in **place_opt** should be specified before running **clock_opt**. When the **-power** option is used with the **-only_cts** option, pre CTS power optimization is done before CTS. When the **-power** option is used with the **-only_psyn** option, only post CTS power optimization is done during post CTS optimization.

DESCRIPTION

The **clock_opt** command performs clock tree synthesis, routing of clock nets,

extraction, optimization, and optionally hold-time violation fixing on the current design. If clock tree synthesis fails, or the routing of clock nets fail, the command returns with a value of 0. If -only_psyn option is specified, the start point will be from clock routing, then run extraction and optimization. This can be used in a user-customized CTS flow where user performs clock tree synthesis outside of `clock_opt`.

Prior to `clock_opt`, **set_clock_tree_options** can be used for controlling `compile_clock_tree`. **set_latency_adjustment_options** can be used to issue directives to control the adjustment of latency on clock objects belonging to virtual and real clocks. If no directives are given, the default `clock_opt` flow will update the latencies of real clocks with their insertion delays obtained after `compile_clock_tree`, `optimize_clock_tree`, and optionally `balance_inter_clock_delay`. **set_inter_clock_delay_options** can be used for controlling the behavior of interclock delay balancing within `clock_opt`.

Briefly, `clock_opt` performs: - `compile_clock_tree` - `optimize_clock_tree` - `set_propagated_clock` for all clocks from root pin, but keeps the clock object as ideal - perform interclock balance if so directed - set clock buffers as fixed - updates latency on clock objects if so directed

Multicorner-Multimode Support

This command uses information from the clock tree synthesis scenario, as well as the active scenarios.

EXAMPLES

The following command performs clock tree synthesis, routing of all clock nets, extraction, and optimization:

```
prompt> clock_opt
```

SEE ALSO

`extract_rc(2)`
`psynopt(2)`
`place_opt(2)`

close_distributed_route

Closes all of the sockets and shuts down the daemons.

SYNTAX

```
integer close_distributed_route
```

DESCRIPTION

Closes all of the sockets and shuts down the daemons on the slave machines.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

```
set_distributed_route(2)  
report_distributed_route(2)  
remove_distributed_route(2)
```

close_mw_cel

Closes the specified Milkyway designs.

SYNTAX

```
status close_mw_cel
[-save]
[-all_views]
[-all_versions]
[mw_cel_list]
```

Data Types

mw_cel_list list

ARGUMENTS

-save

Indicates that the specified Milkyway designs are to be saved before closing. By default, the command discards any changes made to the Milkyway design and closes the specified Milkyway design.

-all_views

Close all opening views of specified Milkyway designs. By default, the command close the specified Milkyway designs. If this option is used with **-save**, only views supported by `save_mw_cel` will be saved firstly and then all opened views will be closed. If specifying this option without **-all_versions**, only the latest versions of all views will be closed.

-all_versions

Close all versions of specified Milkyway designs. If specifying this option with **-all_views**, all views and all versions of the specified Milkyway designs will be closed, or else only all versions of the specified views will be closed.

mw_cel_list

Specifies Milkyway designs to be closed. You can specify Milkyway designs by name, name pattern, or by the Milkyway design collection's name. For example, specifying `top` matches a Milkyway design named `top` in the current library. Specifying `top*` matches all Milkyway designs having names beginning with `top`. The command **close_mw_cel [get_mw_cels *]** closes all Milkyway designs in the current library. By default, the command uses the current Milkyway design.

DESCRIPTION

This command saves or discards specified Milkyway designs or the current Milkyway design and then closes them. If the closed Milkyway design is the current Milkyway design, the command automatically clears the Milkyway design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example discards and closes the current Milkyway design.

```
prompt> close_mw_cel
1
```

The following example saves and closes a list of Milkyway designs.

```
prompt> close_mw_cel -save {test1 test2}
Infomation: Saved design named test1.CEL;1.
Infomation: Saved design named test2.CEL;1.
1
```

The following example discards and closes a list of Milkyway designs.

```
prompt> close_mw_cel {test1 test2}
1
```

The following example saves and closes all views of the specified Milkyway design.

```
prompt> close_mw_cel -save -all_views test1
Information: Saved design named test1.CEL;1.
Information: Saved design named test1.FILL;2.
1
```

The following example saves and closes all versions of the specified Milkyway design.

```
prompt> close_mw_cel -save -all_versions {test1.FILL}
Information: Saved design named test1.FILL;1.
Information: Saved design named test1.FILL;2.
1
```

The following example saves and closes all views and all versions of the specified Milkyway design.

```
prompt> close_mw_cel -save -all_views -all_versions test1
Information: Saved design named test1.CEL;1.
Information: Saved design named test1.FILL;1.
Information: Saved design named test1.FILL;2.
1
```

list_mw_cels(2)

close_mw_lib

Closes the current Milkyway library.

SYNTAX

```
status close_mw_lib
[-save]
```

ARGUMENTS

-save

Saves all Milkyway cels opened in this library. By default, the command discards changes of Milkyway cels in this library.

DESCRIPTION

This command closes the current Milkyway library. It returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example closes the current Milkyway library.

```
prompt> close_mw_lib
1
```

SEE ALSO

[open_mw_lib\(2\)](#)

Collections_and_Querying

Describes the methodology for creating collections of objects and querying objects in the database.

DESCRIPTION

Synopsys applications build an internal database of the netlist and the attributes applied to it. This database consists of several classes of objects, including designs, libraries, ports, cells, nets, pins, and clocks. Most commands operate on these objects.

By definition

A collection is a group of objects exported to the Tcl user interface.

Collections have an internal representation (the objects), and sometimes, a string representation. The string representation is generally used only for error messages. A set of commands to create and manipulate collections is provided as an integral part of the user interface. The collection commands encompass two categories: those that create collections of objects for use by another command, and one that queries objects for your viewing. The result of a command that creates a collection is a Tcl object that can be passed along to another command. For a query command, although the visible output looks like a list of objects (a list of object names is displayed), the result of a query command is the empty string.

An empty string "" is equivalent to the empty collection, that is, a collection with zero elements.

Homogeneous and Heterogeneous Collections

A homogeneous collection contains only one type of object. A heterogeneous collection can contain more than one type of object. Commands that accept collections as arguments can accept either type of collection.

Lifetime of a Collection

Collections are active only as long as they are referenced. Typically, a collection is referenced when a variable is set to the result of a command that creates it, or when it is passed as an argument to a command or a procedure. For example, if in PrimeTime, you save a collection of ports:

```
dc_shell-t> set ports [get_ports *]
```

then either of the following two commands deletes the collection referenced by the *ports* variable:

```
dc_shell-t> unset ports
dc_shell-t> set ports "value"
```

Collections can be implicitly deleted when they go out of scope. Collections go out of scope when the parent (or other antecedent) of the objects within the collection is deleted. For example, if our collection of ports is owned by a design, it is implicitly deleted when the design that owns the ports is deleted. When a collection is implicitly deleted, the variable that referenced the collection still holds a string representation of the collection. However, since the collection is gone, this value is useless, as illustrated in the following example from PrimeTime:

```
dc_shell-t> current_design
{"TOP"}

dc_shell-t> set ports [get_ports in*]
{"in0", "in1"}

dc_shell-t> remove_design TOP
Removing design 'TOP'...

dc_shell-t> query_objects $ports
Error: No such collection '_sel26' (SEL-001)
```

Iteration

To iterate over the objects in a collection, use the **foreach_in_collection** command. You cannot use the Tcl-supplied **foreach** iterator to iterate over the objects in a collection, because **foreach** requires a list, and a collection is not a list. In fact, if you use **foreach** on a collection, it will destroy the collection. The arguments to **foreach_in_collection** are similar to those of foreach: an iterator variable, the collections over which to iterate, and the script to apply at each iteration. Note that unlike **foreach**, **foreach_in_collection** does not accept a list of iterator variables.

The following example is an iterative way to perform a query:

```
dc_shell-t> \
foreach_in_collection s1 $collection {
    echo [get_object_name $s1]
}
```

For details, see the **foreach_in_collection** man page or the user guide.

Manipulating Collections

A variety of commands are provided to manipulate collections.

- **add_to_collection** - This command takes a base collection and a list of element names or collections that you want to add to it. The base collection can be the empty collection. The result is a new collection. In addition, **add_to_collection** allows you to remove duplicate objects from the collection with the **-unique** option.

- **remove_from_collection** - This command takes a base collection and a list of element names or collections that you want to remove from it. For example, in PrimeTime:

```
dc_shell-t> set dports [remove_from_collection [all_inputs] CLK]
           {"in1", "in2", "in3"}
```

- **compare_collections** - Verify that two collections contain the same objects (optionally, in the same order). Result is "0" on success.

- **copy_collection** - Creates a new collection containing the same objects (in the same order) as a given collection. Not all collections can be copied.

- **index_collection** - Extracts a single object from a collection and creates a new collection containing that object. Not all collections can be indexed.

- **sizeof_collection** - Returns the number of objects in a collection.

Filtering

You can filter any collection using the **filter_collection** command. This command takes a base collection and creates a new collection that includes only those objects that match an expression.

Further, many of the commands that create collections support a **-filter** option, which allows the objects to be filtered out of the collection before they are ever included in it. Frequently, this is more efficient than filtering after the fact. The following example from PrimeTime filters out all leaf cells:

```
dc_shell-t> filter_collection [get_cells *] "is_hierarchical == true"
           {"i1", "i2"}
```

The basic form of a filter expression is a series of relations joined together with AND and OR operators. Parentheses are also supported. The basic relation contrasts an attribute name with a value through a relational operator. In the previous

example, `is_hierarchical` is the attribute, `==` is the relational operator, and `true` is the value.

The relational operators are

```
== Equal
!= Not equal
> Greater than
< Less than
>= Greater than or equal to
<= Less than or equal to
=~ Matches pattern
!~ Does not match pattern
```

The basic relational rules are

- String attributes can be compared with any operator.
- Numeric attributes cannot be compared with pattern match operators.
- Boolean attributes can be compared only with `==` and `!=`. The value can be only `true` or `false`.

See the appropriate man pages for complete details.

Sorting Collections

You can sort a collection using the `sort_collection` command. This command takes a base collection and a list of attributes as sort keys. The result is a copy of the base collection sorted by the given keys. For example, the following PrimeTime command will sort the ports by direction, then by full name.

```
dc_shell-t> sort_collection [get_ports *] {direction full_name}
{"in1", "in2", "out1", "out2"}
```

Sorting is ascending by default, or descending with the `-descending` option.

Implicit Query of Collections

All commands that create collections implicitly query the collection when the command is used at the command line. The number of objects displayed is controlled by the variable `collection_result_display_limit`. Consider the following examples from PrimeTime:

```
dc_shell-t> set_input_delay 3.0 [get_ports in*]
```

```

1
dc_shell-t> get_ports in*
{"in0", "in1", "in2"}
dc_shell-t> query_objects -verbose [get_ports in*]
{"port:in0", "port:in1", "port:in2"}
dc_shell-t> set iports [get_ports in*]
{"in0", "in1", "in2"}

```

In the first example, the **get_ports** command creates a collection of ports that is passed to the **set_input_delay** command. This collection is not the result of the primary command (**set_input_delay**), so it is not queried. The second example shows how a command which creates a collection automatically queries the collection when that command is used as a primary command. The third example shows the verbose feature of **query_objects**, which is not available with implicit query. Finally, the fourth example sets the variable **iports** to the result of the **get_ports** command. Only in this example does the collection persist to future commands until **iports** is overwritten, unset, or goes out of scope (for more information, see the Scope section).

Controlling Deletion Effort

In cases where a subset of objects in a design is removed, it is not always clear whether to remove the collection. PrimeTime supplies the **collection_deletion_effort** variable to control how much effort is expended to preserve collections. For complete details, see the **collection_deletion_effort** man page.

```

commit_fp_group_block_ring

Commits the power ground group block ring and/or straps based on the results from the **create_fp_group_block_ring** command.

SYNTAX

```
status commit_fp_group_block_ring
```

ARGUMENTS

none

DESCRIPTION

Generates a real power ground group block ring and/or straps based on group block ring creation results from the **create_fp_group_block_ring** command. Vias along with wires are also created at each intersection of two wires (For example, a ring or strap) in opposite directions.

EXAMPLES

The following example commits the group block ring.

```
prompt> commit_fp_group_block_ring
```

SEE ALSO

[create_fp_group_block_ring\(2\)](#)

commit_fp_plan_groups

Transforms the specified plan groups into soft macros.

SYNTAX

```
status commit_fp_plan_groups
[-push_down_power_and_ground_straps]
[-new_top_cell new_cell_name]
[plan_groups]
```

Data Types

<i>new_cell_name</i>	string
<i>plan_groups</i>	collection

ARGUMENTS

-push_down_power_and_ground_straps

Specifies that the command pushes down global power and ground preroutes into the soft macro and removes them from the top level. This option only pertains to power and ground nets that are outside the scope of the plan group. Any routing associated with a power or ground net that is defined within the plan group will be pushed down automatically along with any other net route objects that are owned by the plan group. The use of this option is equivalent to the combination of running `commit_fp_plan_groups` (without this option) and subsequently running `push_down_fp_objects` and specifying routing as the type and specifying a collection of power and ground nets.

-new_top_cell *new_cell_name*

Specifies that the command creates a new top cell where the top-level changes occur.

plan_groups

Specifies the plan groups that are committed to soft macros.

If you do not specify this option, all plan groups are committed to soft macros.

DESCRIPTION

This command transforms the specified plan groups into soft macros. For each plan group processed, the tool creates a soft macro to replace the plan group. The soft macro uses the plan group's placement. The soft macro's port instances are connected to their corresponding nets. The plan group's cells are disconnected and deleted, along with the plan group. On the soft macro level, the cells that correspond to the plan group's master-level cells are created in the child, placed relative to their master-level placement, and connected to the corresponding macro-level nets. When used with the "`-new_top_cell`" option, the user has the benefit of the changes made to a new top layout cell without modifying the currently open cell. If a UPF power domain is detected which is defined completely within the plan group's hierarchical cell instance, and the power domain lists the hierarchical cell instance as an element of that power domain, all UPF objects related to that power domain will be

pushed into the soft macro and removed from the top cell. Any embedded UPF power domain and voltage area whose scope is a child of the plan group's hierarchical cell instance will also be pushed down into the soft macro and removed from the top cell. All routing associated with plangroup-owned nets (nets in the top cell that are internal to the plan groups) is automatically removed from the top cell and instantiated in the soft macro cell, both signal and power/ground (as long as they are owned by the plan group). Global power and ground nets do not get pushed down automatically, as they are not "owned" uniquely by the plan group. Such global power and ground nets must be pushed down after commit using push_down_fp_objects.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example commits the specified plan groups to soft macros.

```
prompt> commit_fp_plan_groups $PG_List
```

The following example commits all plan groups to soft macros and makes the changes in a new cell named TOP_NEW.

```
prompt> commit_fp_plan_groups -new_top_cell TOP_NEW
```

The following example commits all plan groups in the current design to soft macros and pushes down the global power and ground net straps.

```
prompt> commit_fp_plan_groups -push_down_power_and_ground_straps
```

SEE ALSO

```
uncommit_fp_soft_macros(2)  
push_down_fp_objects(2)
```

commit_fp_rail

Commits the power network (power/ground wires and vias) based on power network synthesis (PNS) results.

SYNTAX

```
int commit_fp_rail
```

ARGUMENTS

none

DESCRIPTION

Generates a real power network (power/ground wires and vias) based on PNS results, when the IR (voltage) drop map meets target IR drop constraints. Power/ground pins might also be created on the chip boundary.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example commits a real power network after PNS is done.

```
prompt> commit_fp_rail
```

SEE ALSO

`synthesize_fp_rail(2)`

commit_skew_group

Checks the skew groups defined in the design for common problems that can adversely impact clock tree synthesis. If no problem is found, the command modifies clock tree structure to isolate skew groups.

SYNTAX

```
status commit_skew_group
[-check_only]
```

ARGUMENTS

-check_only
Causes the command only to check skew groups for common problems but not modifies the clock tree structure to isolate skew groups.

DESCRIPTION

Use the **commit_skew_group** command after defining skew groups for a linked design to check for common problems that adversely impact clock tree synthesis. The following classes of checks are performed:

CTS-924 pins in a skew group from different master clocks CTS-925 pins in a skew group with upstream/downstream relation CTS-926 looping dependencies between skew groups CTS-927 more than one level of dependency between skew groups CTS-928 pins in a skew group with no clocks reaching them CTS-929 skew group spreading across more than one sub-tree CTS-930 incompatible options CTS-931 pins beyond exceptions

When **commit_skew_group** encounters a problem, the tool displays a warning or information message, which is sometimes followed by additional information to help solve the problem. Refer to the man page for each message that explains the problem in detail and shows how to solve it. When no problem is found, the command modifies clock tree structure to isolate skew groups.

EXAMPLES

In the following example, the **commit_skew_group** command checks all skew groups in the currently linked design and isolates skew groups if no problem is found:

```
prompt> commit_skew_group
```

In the following example, the **commit_skew_group** command checks all skew groups in the currently linked design. Clock tree structure is not modified to isolate skew groups:

```
prompt> commit_skew_group -check_only
```

SEE ALSO

`set_skew_group(2)`
`remove_skew_group(2)`
`report_skew_group(2)`
`compile_clock_tree(2)`

compare_collections

Compares the contents of two collections. If the same objects are in both collections, the result is 0 (zero), like string compare. If they are different, the result is nonzero. The order of the objects can optionally be considered.

SYNTAX

```
int compare_collections
[-order_dependent]
collection1
collection2
```

Data Types

<i>collection1</i>	collection
<i>collection2</i>	collection

ARGUMENTS

-order_dependent

Specifies that the order of the objects is to be considered. The collections are considered to be different if the objects are ordered differently.

collection1

Specifies the base collection for the comparison. The empty string (the empty collection) is a legal value for the *collection1* argument.

collection2

Specifies the collection with which to compare to *collection1*. The empty string (the empty collection) is a legal value for the *collection2* argument.

DESCRIPTION

The **compare_collections** command is used to compare the contents of two collections. By default, the order of the objects does not matter, so that a collection of the *u1* and *u2* cells is the same as a collection of the *u2* and *u1*. By using the **-order_dependent** option, the order of the objects is considered.

Either or both of the collections can be the empty string (the empty collection). If two empty collections are compared, the comparison succeeds (**compare_collections** considers them identical) and the result is 0 (zero).

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows a variety of comparisons. Note that a result of 0 (zero)

from **compare_collections** indicates success. Any other result indicates failure.

```
prompt> compare_collections [get_cells *] [get_cells *]
0
prompt> set c1 [get_cells {u1 u2}]
{"u1", "u2"}
prompt> set c2 [get_cells {u2 u1}]
 {"u2", "u1"}
prompt> set c3 [get_cells {u2 u4 u6}]
 {"u2", "u4", "u6"}
prompt> compare_collections $c1 $c2
0
prompt> compare_collections $c1 $c2 -order_dependent
-1
prompt> compare_collections $c1 $c3
-1
```

The following example builds on the previous example by showing how empty collections are compared.

```
prompt> set c4 ""
prompt> compare_collections $c1 $c4
-1
prompt> compare_collections $c4 $c4
0
```

SEE ALSO

[collections\(2\)](#)

compare_delay_calculation

Compares the Arnoldi-based delays with the Elmore delays in the current design.

SYNTAX

```
integer compare_delay_calculation
[-verbose]
[-ccs]
```

ARGUMENTS

-verbose

Creates histogram-style reports showing the distribution of the delay differences when using the Arnoldi-based and Elmore delay models.

-ccs

Creates histogram-style reports showing the delay differences when using Composite Current Source (CCS) models and nonlinear delay models (NLDM).

DESCRIPTION

The **compare_delay_calculation** command calculates and compares the timing results of the current design using the Arnoldi-based and Elmore delay models. This command reports pin-to-pin delays, max transition, several DRC violations and the worst slack within each path group for both delay models. In the verbose mode this command creates histogram-style reports showing the distribution of the Arnoldi-based and Elmore delay differences on the paths with negative slacks. The distribution of the differences is represented by the two histograms showing the delay differences in the library units and in the percentage.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following is an example of an Arnoldi-based and Elmore delay calculation report:

```
prompt> compare_delay_calculation -verbose
```

```
Percent of Arnoldi-based delays = 66.67%
```

	Elmore	Arnoldi
Max Transition	0.195	0.521
DRC Violations	1	1
Group	WNS TNS	WNS TNS

CLK1	1.71	3.96	1.46	2.64	
default	0.00	0.00	0.00	0.00	

Histograms for Delays with Negative Slack

Difference (%)	Count	%
0 - 1	2	8.33
1 - 5	5	20.83
5 - 10	3	12.50
10 - 50	10	41.67
50 - 100	4	16.67
100+	0	0.00

Difference(lib_units)	Count	%
0.0 - 0.001	0	0.00
0.001- 0.01	3	12.50
0.01 - 0.05	7	29.17
0.05 - 0.1	0	0.00
0.1 - 1.0	14	58.33

1.0+	0	0.00

SEE ALSO

```
read_parasitics(2)
report_delay_calculation(2)
report_timing(2)
```

compare_interface_timing

Compares two **write_interface_timing** reports.

SYNTAX

```
int compare_interface_timing  
ref_timing_file  
cmp_timing_file  
[-output file_name]  
[-absolute_tolerance atol_list]  
[-nosplit]  
[-significant_digit digits]
```

Data Types

<i>ref_timing_file</i>	string
<i>cmp_timing_file</i>	string
<i>file_name</i>	string
<i>atol_list</i>	list
<i>digits</i>	int

ARGUMENTS

ref_timing_file
Specifies the name of the timing file to be used as the reference in the comparison.

cmp_timing_file
Specifies the name of the timing file to be compared to the reference timing file.

-output *file_name*
Specifies the name of the output file to which the results of the comparison are to be written. The information written to *file_name* specifies PASS/FAIL status for every parameter compared by the command. By default, these results are written to the session transcript. All informational, warning, or error messages are still directed to the session transcript even if this option is specified.

-absolute_tolerance *atol_list*
Specifies the absolute error tolerance for time data. See below for a description of the tolerance format. The default is "0.1".

-nosplit
The **-nosplit** option prevents line-splitting. This is most useful for performing diffs on previous scripts or for postprocessing the script.

-significant_digit *digits*
Specifies the number of digits to the right of the decimal point that are to be reported following the method used in the **report_timing** command. Allowed values are 0-13. The default value is 2. Use this option if you want to override the default. See below for a more detailed description of

significant digits.

DESCRIPTION

The **compare_interface_timing** command compares two interface timing files (called the "reference" and "comparison" files) previously generated by the **write_interface_timing** command. The result is PASS if the timing parameter values in the two files are the same or within a specified tolerance. The result is FAIL if both columns have data and the tolerance is exceeded. If all comparisons in the report are PASS, the return code for the **compare_interface_timing** command is 0. If one or more comparisons result in FAIL, the return code is 1. If either file format does not conform to the **write_interface_timing** standard, the command issues a warning message.

The **compare_interface_timing** command lets you specify the input and output files for the comparison, and the allowed tolerance levels that trigger comparison failures.

If the reference and comparison files were generated using different contexts then the two files may contain different timing arcs along with different slacks. If an arc exists in the comparison file but not in the reference file then **compare_interface_timing** ignores the extra arcs. If an arc exists in the reference file but not in the comparison file, then **compare_interface_timing** reports the slack value for the reference file, but either "N.C." or "----" for the comparison file slack. The slack difference is marked as "----", and the status is FAIL.

The slack for a missing arc is marked as "N.C.", meaning not critical, if it exists in the reference but not in the comparison file. Each of these groups can have several clocks in them, and under certain circumstances **write_interface_timing** will see the path to one clock as critical for the reference view and report that arc and slack, but another clock as critical in the comparison view and report that arc and slack.

The **compare_interface_timing** command deals with significant digits in two distinct ways. First, the internal computations are limited to the minimum precision of the two input files. This means that if the *ref_timing_file* was generated with three digits and the *cmp_timing_file* with four, then **compare_interface_timing** will use three digits for all internal computations.

It is important to make the tolerances larger than a unit of the computational significant digits, or **compare_interface_timing** could generate false FAIL and PASS messages. This can happen because of rounding. For example, if the internal significant digits is two, and the absolute tolerance is set to 0.01, then a difference of 0.014 is rounded to 0.01 and reported as a PASS even though it is outside the tolerance. Similarly, if the absolute tolerance of 0.009 a difference of 0.009 is rounded to 0.01 and reported as FAIL even though it is within tolerance. The user should ensure that the number of digits of accuracy of the input files is greater than the accuracy of the tolerances.

A second use of significant digits is in report generation, which is limited to the minimum of the input precision and the significant digits specified by the user. The user specifies the significant digits for the report through the **-significant_digits** option. For example, if the value for the **-significant_digits** option is five but the *ref_timing_file* was generated with four digits, then the report will be limited to four digits. Note that this use of significant digits does not affect the PASS or FAIL status, but a reported difference could look like it should have a different

status if the difference is close to a tolerances and the difference rounded when writing the report.

Absolute tolerance is a list of either one or two floating point numbers and the sign of the values has no effect. If there is only one number it serves to specify both the plus and minus tolerances. The plus tolerance is the absolute value of the number, and the minus tolerance is the inverse of the plus. For example, `atol_list` equal to `0.1` indicates that time differences of less than 0.1 and greater than -0.1 are considered to be passing.

If there are two numbers then the first specifies the minus bound and the second the plus. The minus tolerance is the inverse of the absolute value of the first number, and the plus tolerance is the absolute value of the second number. Having a pair of numbers allows different tolerances to be applied for negative and positive errors, which can be interpreted as optimism and pessimism depending on the arc type. For example, an `atol_list` equal to `{0.2 -0.3}` indicates that data differences of less than 0.3 and greater than -0.2 are considered passing.

EXAMPLES

The following example shows a comparison:

```
prompt> compare_interface_timing demo_net.rpt demo_etm.rpt  
? -absolute_tolerance {0.01 0.02}
```

```

SEE ALSO

`write_interface_timing(2)`

compare_lib

Performs a cross-reference check between a technology library and a symbol library or between a technology library and a physical library.

SYNTAX

```
int compare_lib  
library1  
library2
```

Data Types

library1	string
library2	string

ARGUMENTS

library1	Specifies the name of a technology library.
library2	Specifies the name of a symbol library or physical library to be compared with the technology library.

DESCRIPTION

This command compares the given technology and symbol (physical) libraries for consistency. For this command to execute successfully, the libraries to compared must be in the Synopsys internal database format and must also exist in dc_shell or lc_shell. To compile a library, use the **read_lib** command. To load a compiled library, use the **read** command.

The **compare_lib** command performs the following checks:

- First, it ensures that each component in the technology library has a corresponding symbol definition in the symbol(physical) library.
- Second, it crosschecks the pin names of each component in the technology library against the pin names defined for its corresponding symbol.
- Third, it ensures that each symbol in the symbol (physical) library has a corresponding cell definition in the technology library.
- Fourth, it crosschecks the pin names of each symbol in the symbol (physical) library against the pin names defined for its corresponding technology cell.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example compares two specific libraries; a technology library and a symbol library.

```
prompt> compare_lib tech_lib.db sym_lib.sdb
```

SEE ALSO

```
read_lib(2)  
report_lib(2)  
write_lib(2)
```

compare_rc

Compares annotated capacitance with estimation capacitance.

SYNTAX

```
int compare_rc
[-bound max_float_capacitance]
[-min]
[-net net_list]
[-threshold min_float_capacitance]
[-worst_nets integer_nets]
```

Data Types

<i>max_float_capacitance</i>	float
<i>net_list</i>	list
<i>min_float_capacitance</i>	float
<i>integer_nets</i>	integer

ARGUMENTS

-bound *max_float_capacitance*
Specifies the maximum back-annotated capacitance below which nets are to be considered for the report.

-min
Reports the minimum conditions. By default, the command reports maximum conditions.

-net *net_list*
Compares only those nets in *net_list*. If you also use either the **-threshold** or the **-bound** option, only those nets that meet the criteria in the current instance are used. When you use the **-net** option, the command ignores the **-worst_nets** option.

-threshold *min_float_capacitance*
Specifies the minimum back-annotated capacitance above which nets are to be considered for the report.

-worst_nets *integer_nets*
Specifies the number of worst nets to report based on the difference between the estimated capacitance and the back-annotated capacitance. If a negative number is specified, all nets are reported without ordering. The default is 10.

DESCRIPTION

This command compares the back-annotated capacitance on the nets in the design with the estimation capacitance and plots the percentage deviation of estimation capacitance from the back-annotated capacitance versus the percentage of nets in the deviation range. The worst deviation that is reported is 200 percent. Any deviation

above that is rounded to 200 percent. This command also reports the worst nets in terms of percentage deviation of estimated capacitance from the back-annotated capacitance.

Before running this command, you must source set_load files or read in a post route data base with capacitance on the nets in the design.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example runs the **compare_rc** command.

```
prompt> compare_rc -threshold 0.0001 -worst_nets 25
Loading target library 'ssc_core'
Loading design 'address'

`set_load(2)`

compile_clock_tree

Builds a clock tree based on the clock tree definition.

SYNTAX

```
status compile_clock_tree
[-clock_trees name_or_source_pin_list]
[-config_file_read read_filename]
[-config_file_write write_filename]
[-operating_condition min | max | min_max]
[-high_fanout_net net_or_pin_list
[-sync_phase rise | fall | both]]
```

Data Types

<i>name_or_source_pin_list</i>	list
<i>net_or_pin_list</i>	list

ARGUMENTS

-clock_trees *name_or_source_pin_list*

Compiles the clock trees whose names or root pins are listed in the *name_or_source_pin_list* argument. Each element of the *name_or_source_pin_list* can be either a user-assigned symbolic name or the name of the source (port or pin) of each clock tree. It must match the full name of the clock tree root pin or port passed to the **set_clock_tree_options** command by using the **-root** option. By default, the command is applied to all currently-defined clock trees.

-config_file_read *read_filename*

Instructs the clock tree synthesis engine to read the clock tree configuration specified in *read_filename* file. To see the format of the clock tree configuration, build the clock tree and then write out the configuration file. You can edit the file to obtain the desired configuration. If you are already familiar with the format, then clock tree synthesis can begin with a specified configuration file. The configuration can be soft, meaning that only the number of levels is specified, and the clock tree synthesis engine will honor the specification. The number of buffers at each level are determined by clock tree synthesis. The configuration can also be hard, meaning that the number of levels and number of buffers at each level is specified. The buffer type can also be specified. The clock tree synthesis engine will honor all of the specifications.

-config_file_write *write_filename*

Instructs the clock tree synthesis engine to write out the clock tree configuration levels and number of buffers at each level after clock tree synthesis has been completed.

-operating_condition *min | max | min_max*

Instructs the clock tree synthesis engine to use the specified operating condition. This option inserts a balanced buffer tree for signal high fanout nets using the same techniques as in clock tree synthesis. You must specify

the nets or nets' driving pin in the *net_or_pin_list*. A common use of this option is for setting or resetting nets. By default, it uses **max**.

-high_fanout_net net_or_pin_list
Specifies a list of high fanout nets.

-sync_phase rise | fall | both
Instructs the HFCTS to balance skew at rise, fall, or both edges. Use this option only when you also use the **-high_fanout_net** option. By default, the tool uses **rise** in skew calculation.

DESCRIPTION

This command synthesizes a clock tree and updates the IC Compiler database with the results of the compiled clock trees.

Clock trees to be synthesized must be previously defined by using the **set_clock_tree_options** command before using the **compile_clock_tree** command. Before running the **compile_clock_tree** command, you must also run the **set_clock_tree_references** command to define which clock tree buffers or inverters can be used for those clocks during clock tree synthesis.

By default, design rule checking (DRC) violations beyond exception pins are fixed at the end of clock tree synthesis.

Multicorner-Multimode Support

This command uses information from the clock tree synthesis scenario.

EXAMPLES

The following example shows a clock tree with root *CLK1* implemented with a set of specified library references to be used as buffers. The *CLK1* clock is compiled and updated in the design netlist.

```
prompt> set_clock_tree_options -root [get_ports CLK1]
prompt> set_clock_tree_references -reference {buffer1x buffer2x}
```

The following example shows a command performing clock tree synthesis for the *CLK1* clock.

```
prompt> compile_clock_tree -clock_trees CLK1
```

The following example shows a command reporting the structural and timing characteristics of the compiled clock tree.

```
prompt> report_clock_tree -clock_trees CLK1
```

SEE ALSO

`report_clock_tree(2)`
`set_clock_tree_options(2)`
`set_clock_tree_references(2)`

compile_fp_clock_plan

Compiles clock trees inside a plan group and builds clock trees at the top level according to the plan group's result.

SYNTAX

```
status compile_fp_clock_plan
[-operation_cond min | max(default) | min_max]
[-anchor_only]
[-parallel]
```

ARGUMENTS

```
-operation_cond [min | max(default) | min_max]
    Instructs the tool to use the specified operating condition.

-anchor_only
    Specifies that the tool should only insert anchor cells on the plan group input ports, but should not synthesize the clock plan.
    By default, the tool inserts anchor cells on the plan group input ports, then synthesizes the clock plan.

-parallel
    Specifies that the tool generates clock trees inside plan groups using multiple processes in parallel to speed-up run time of clock planning.
```

DESCRIPTION

The **compile_fp_clock_plan** command performs the following tasks:

1. Inserts anchor cells on the plan group input ports.
2. Generates the clock trees inside each plan group.
3. Defines the input pin of each anchor cell to be a float pin.
4. Generates the top-level clock tree.
5. Performs detail routing on the clock interface nets.

The log-files and reports are generated in clock-planning output directory.

The plan groups to be synthesized must be defined with the **set_fp_clock_plan_options** command before using the **compile_fp_clock_plan** command. In addition, you must set the following options by using the **set_clock_tree_options** command:

- parallel options is most efficient in speeding up clock planning in large designs meeting the following criterias:
1. Design includes more than 3 plan group
 2. Most of the clock sinks are locataed in the plan groups
 3. Design has limited clock dependency between plan groups, i.e., only a small number of clock nets come out of a plan group and drive subtrees at top level or in other plan groups.
- parallel options is not compatible with design of fully abutted floorplan. Because parallelized generation of plan group clock tree does not keep the plan group clock trees, -parallel options will be ignored when **-keep_block_tree** is set to true by **set_fp_clock_plan_options**.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

In the following example, the anchor cell CLKBUF12 is inserted in all plan groups, then the clock net *CLK1* is implemented in all plan groups.

```
prompt> set_fp_clock_plan_options -clock_nets CLK1 \
      -anchor_cell CLKBUF12
prompt> compile_fp_clock_plan
```

In the following example, the anchor cell CLKBUF12 is inserted in all plan groups, then the clock net *CLK1* is implemented in all plan groups using multiple processes.

```
prompt> set_fp_clock_plan_options -clock_nets CLK1 \
      -anchor_cell CLKBUF12
prompt> compile_fp_clock_plan -parallel
```

The following command inserts anchor cells for each plan group, but does not perform clock tree synthesis.

```
prompt> set_fp_clock_plan_options -clock_nets CLK1 \
      -anchor_cell CLKBUF12
prompt> compile_fp_clock_plan -anchor_only
```

SEE ALSO

[set_fp_clock_plan_options\(2\)](#)

compile_premesh_tree

Invokes clock tree synthesis on a net that is driving a clock mesh.

SYNTAX

```
status compile_premesh_tree
      -clock_tree name_or_root_pin
```

Data Types

name_or_root_pin string

ARGUMENTS

```
-clock_tree name_or_root_pin
```

Specifies the name of the clock tree or the name of the root (a pin, port or net) of the clock mesh. This is a required option.

DESCRIPTION

This command invokes the **compile_clock_treefp** command to generate a buffer tree with drivers connecting to a clock mesh. Before running **compile_premesh_tree**, you must first create clock mesh wiring grid and add drivers that are connected to the wiring grid. The inputs of the buffer tree that drives the clock mesh wiring grid are typically connected to the clock root. The outputs of the buffer tree that drives the clock mesh wiring grid are connected to the mesh net. These connections must be set up before the command invokes **compile_clock_tree**.

The root net might be associated with one or more clocks, but this command processes the root net as a single electrical signal. Any multiplexing of clocks must be done in the circuitry that drives the driver pin or port of the root net. This command only generates a buffer tree and does not generate any multi-input gates for gated clocks or integrated clock gating (ICG) cells.

See **create_clock_mesh** for more information on clock net, root net, and mesh net.

Multicorner-Multimode Support

This command uses information from the clock tree synthesis scenario.

EXAMPLE

The following command invokes clock tree synthesis on an ideal clock net that was previously connected to the ideal net "clk1".

```
prompt> compile_premesh_tree -clock_tree [get_pins clk1top/z]
1
```

SEE ALSO

`add_clock_drivers(2)`
`route_mesh_net(2)`
`analyze_subcircuit(2)`
`compile_clock_tree(2)`

compute_polygons

Returns a list of polygons that cover the areas according to the Boolean operation type.

SYNTAX

```
list compute_polygons
-boolean type
polygon1
polygon2
```

Data Types

<i>type</i>	string
<i>polygon1</i>	list
<i>polygon2</i>	list

ARGUMENTS

-boolean type

Specify the type of Boolean operation. Type can be *and*, *or*, *not*, *xor*.
If the operation type is *and*, the returned polygons will cover the areas common to the input polygons;
If the operation type is *or*, the returned polygons will cover the areas, which are covered by either polygon or both polygons;
If the operation type is *not*, the returned polygons will cover the areas, which are covered by the first polygon, but not covered by the second polygon;
If the operation type is *xor*, the returned polygons will cover the areas, which are covered by either polygon, but not both polygons.

polygon1

Specifies the first polygon represented as a list of points. The format for a polygon is: {{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}. Besides, a list of one polygon is also supported as input for this option, with the format: {{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}. Note that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinates' unit is specified in technology file (usually it is micron).

polygon2

Specifies the second polygon represented as a list of points. The format for a polygon is: {{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}. Besides, a list of one polygon is also supported as input for this option, with the format: {{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}. Note that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinates' unit is specified in technology file (usually it is micron).

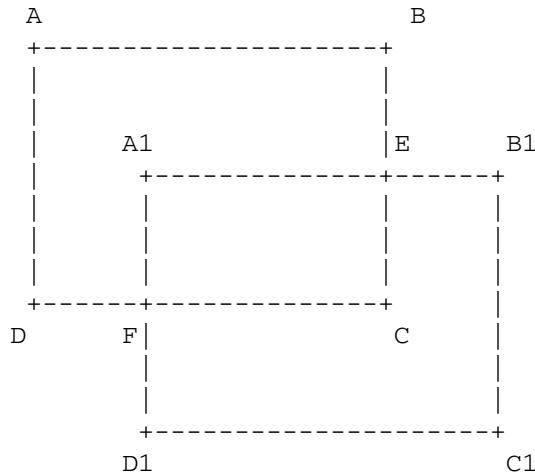

DESCRIPTION

This command gets two outlined polygons and then applies the specified Boolean operation on them. Each outlined polygon is represented as a list of points. The Boolean operation include *or*, *and*, *not*, *xor*.

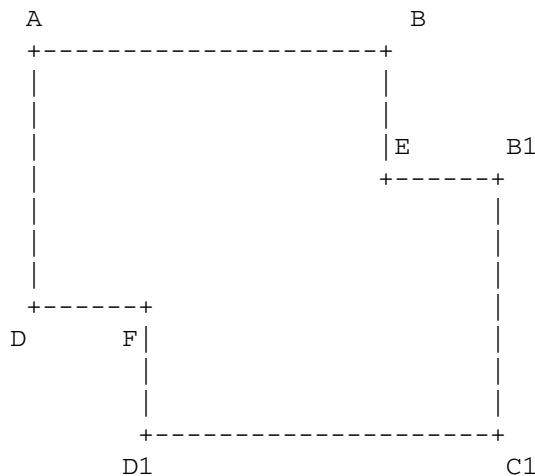

Before this command is used, the library should be opened.

After the operation, the command returns a list of outlined polygons, and the list may consist of one polygon or multiple polygons depending on the result of Boolean operation. Note that for each Boolean operation type, the result could be multiple polygons or one polygon. So do not directly pass the result of this command as a parameter to another polygon command. Tcl list command like **foreach**, **lindex** can be used to extract each polygon from the returned list, and then pass each polygon to other polygon command.

For example: You have two outlined polygons A-B-C-D-A and A1-B1-C1-D1-A1.

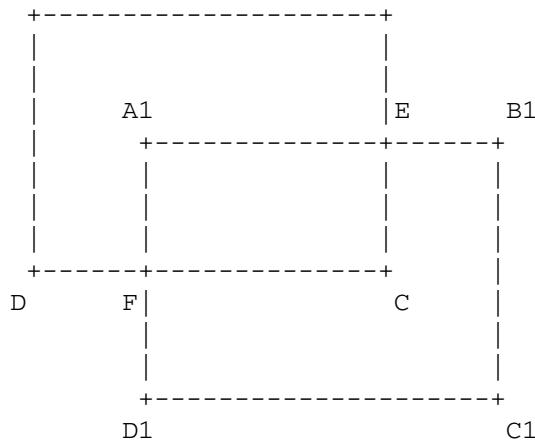

If you use `compute_polygons` to get the *OR* area of the two outlined polygons, you will get a list of 1 outlined polygon A-B-E-B1-C1-D1-F-D-A.

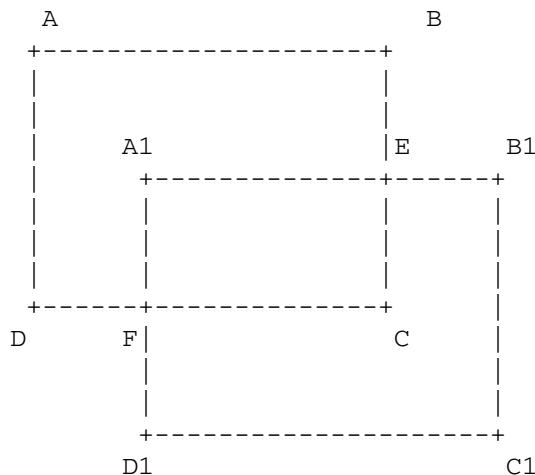

But if you use `compute_polygons` to get the *XOR* area of the outlined polygons, the command will return two polygons A-B-E-A1-F-D-A and E-B1-C1-D1-F-C-E which cover the areas covered by either polygon A-B-C-D-A or A1-B1-C1-D1-A1, but not by both. So the returned list will consist of two outlined polygons.

A B

EXAMPLES

Using the following two polygons as input example. Polygon A-B-C-D-A: `{{0 10} {30 10} {30 30} {0 30} {0 10}}`. Polygon A1-B1-C1-D1-A1: `{{10 0} {40 0} {40 20} {10 20} {10 0}}`.

The following example returns the polygon A1-E-C-F-A1 which covers the common areas of the two input polygons A-B-C-D-A and A1-B1-C1-D1-A1.

```
prompt> compute_polygons -boolean and {{0 10} {30 10} {30 30} {0 30} {0 10}} {{10 0} {40 0} {40 20} {10 20} {10 0}} {{10 20} {30 20} {30 10} {10 10} {10 20}}
```

The following example returns the polygon A-B-E-B1-C1-D1-F-D-A which covers the areas covered by either polygon A-B-C-D-A or A1-B1-C1-D1-A1.

```
prompt> compute_polygons -boolean or {{0 10} {30 10} {30 30} {0 30} {0 10}} {{10 0} {40 0} {40 20} {10 20} {10 0}} {{30 30} {30 20} {40 20} {40 0} {10 0} {10 10} {0 10} {0 30} {30 30}}
```

The following example returns the polygon A-B-E-A1-F-D-A which covers the areas covered by the first polygon A-B-C-D-A, but not covered by the second polygon A1-B1-C1-D1-A1.

```
prompt> compute_polygons -boolean not {{0 10} {30 10} {30 30} {0 30}
{0 10}} {{10 0} {40 0} {40 20} {10 20} {10 0}}
{{30 30} {30 20} {10 20} {10 10} {0 10} {0 30} {30 30}}
```

The following example returns two polygons A-B-E-A1-F-D-A and E-B1-C1-D1-F-C-E which cover the areas covered by either polygon A-B-C-D-A or A1-B1-C1-D1-A1, but not by both.

```
prompt> compute_polygons -boolean xor {{0 10} {30 10} {30 30} {0 30}
{0 10}} {{10 0} {40 0} {40 20} {10 20} {10 0}}
{{40 20} {40 0} {10 0} {10 10} {30 10} {30 20} {40 20}} {{30 30}
{30 20} {10 20} {10 10} {0 10} {0 30} {30 30}}
```

The following script example shows how to use the output of the **compute_polygons** command as input for other UI commands.

```
set poly1 [convert_to_polygon [get_net_shapes RECTANGLE#123]]
Set poly2 [convert_to_polygon [get_net_shapes RECTANGLE#456]]
set my_polys [compute_polygons -boolean xor $poly1 $poly2]

foreach poly $my_polys {
    set my_xor_rect [convert_from_polygon $poly]
    echo $my_xor_rect
}
```

SEE ALSO

```
convert_to_polygon(2)
convert_from_polygon(2)
resize_polygon(2)
```

connect_net

Connects the specified net to the specified pins or ports.

SYNTAX

```
status connect_net
net object_list
```

Data Types

<i>net</i>	string
<i>object_list</i>	list

ARGUMENTS

net

Specifies the net to connect. The net must be a scalar (single bit) net, and must exist in the current design.

object_list

Specifies a list of pins and ports to which the net is to be connected. Pins and ports must be at the same hierarchical level as the specified net, and must exist in the current design. If a specified pin or port is already connected, the tool issues an error message.

DESCRIPTION

This command connects a net to the specified pins or ports at the same hierarchical level. The net can be at any level of hierarchy but the pins or ports should be at the same level. A net can be connected to many pins or ports; however, you cannot connect a pin or port to more than one net.

You can use `connect_net` to connect PG and Tie nets to pins or ports. Only PG nets can be connected to leaf level PG pins. PG nets can not be connected to leaf level signal pins. Tie nets can not be connected to leaf level signal output pins. Tie or PG nets can not be connected to a hierarchical pin which is already connected to a Tie or PG net on the other hierarchical side.

To disconnect objects on a net, use the `disconnect_net` command.

To display pins and ports on a net, use the one of `all_connected` or `get_nets -of $net` commands.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **connect_net** to connect net NET0 to ports A1 and A2 and pin U1/A. The **all_connected** command returns the objects connected to net NET0.

```
prompt> connect_net NET0 [get_ports {A1 A2}]
prompt> connect_net NET0 [get_pins U1/A]
prompt> all_connected NET0
{A1 A2 U1/A}
```

The following example shows the error message generated when you attempt to connect a pin or port to more than one net:

```
prompt> connect_net MY_NET_1 PORT1
Connecting net 'MY_NET_1' to port 'PORT1'.

prompt> connect_net MY_NET_2 PORT1
Error: Object 'PORT1' is already connected to net 'MY_NET_1'.
```

The following example shows how **connect_net** is used to connect net U1/MY_NET to the U1/MY_PORT port.

```
prompt> connect_net U1/MY_NET U1/MY_PORT
```

SEE ALSO

all_connected(2)

connect_pin

Connects pins or ports at any level of hierarchy.

SYNTAX

```
int connect_pin
    -from from_object
    -to to_list
    -port_name port_name
    -verbose
```

Data Types

<i>from_object</i>	list
<i>to_list</i>	list
<i>port_name</i>	string

ARGUMENTS

-from *from_object*
Specifies the pin or port from which to connect. The direction of the pin or port cannot be inout.

-to *to_list*
Specifies a list of pins and ports to which the connection must be made. Pins and ports can be at any level of hierarchy. The direction of the pins or ports cannot be inout.

-port_name *port_name*
Specifies the base name to use as names of ports when a new port is created on subdesigns to make the connection.

-verbose
Specifies that the tool displays individual netlist operations while making the global connections.

DESCRIPTION

This command performs global connections between the source object specified in the *from_object* argument and the objects specified in the *to_list*. The pins and ports specified in the argument can be at any level of hierarchy. The parent design of the pins and ports must be unique.

Leaf level PG pins or hierarchical pins connected to PG or Tie nets on one side of the hierarchy can not be connected using **connect_pin** command.

While making the global connections, ports and nets are created in the subdesigns, if needed. Ports in the subdesigns are reused regardless of their names, when the from pin is already connected to a net. Also, a port in a subdesign is reused if it is unconnected and the name is as specified by the **-port_name** option.

Wherever applicable, the name of the net that is created is the name of the connecting port, as long as there is no net with the same name in that design. If there is an existing net with the name, the name of the net is generated.

The **connect_pin** command ensures that multiply-driven nets are not created. The command does not allow a connection from an output pin to an output pin.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **connect_pin** to connect *U1/Z* and *mid1/bot1/U3/A*.

Use the **report_net -connections** or **report_cell -connections** to view the connections.

```
prompt> connect_pin [get_pins U1/Z] [find pin mid1/bot1/U3/A]  
prompt> report_net -connections [get_net -of [get_pins U1/Z]]
```

report_net(2)

connect_power_domain

Connects power net information for the specified power domains. This command is supported only in non-UPF mode.

SYNTAX

```
status connect_power_domain
power_domains
[-primary_power_net power_net]
[-primary_ground_net ground_net]
[-backup_power_net power_net]
[-backup_ground_net ground_net]
[-internal_power_net internal_power_net]
[-internal_ground_net internal_ground_net]
```

Data Types

<i>power_domains</i>	collection
<i>power_net</i>	string
<i>ground_net</i>	string
<i>internal_power_net</i>	string
<i>internal_ground_net</i>	string

ARGUMENTS

<i>power_domains</i>	Specifies the power domains for which to make the power net information connections.
<i>-primary_power_net power_net</i>	Specifies the primary power net information for the power domains.
<i>-primary_ground_net ground_net</i>	Specifies the primary ground net information for the power domains.
<i>-backup_power_net power_net</i>	Specifies the backup power net information for the power domains.
<i>-backup_ground_net ground_net</i>	Specifies the backup ground net information for the power domains.
<i>-internal_power_net internal_power_net</i>	Specifies the internal power net information for the power domains.
<i>-internal_ground_net internal_ground_net</i>	Specifies the internal ground net information for the power domains.

DESCRIPTION

The **connect_power_domain** command creates logical power connections for the specified power domains. All cells in the power domain inherit the power connections. You can

override the inherited power connections for a cell by using the **connect_power_net_info** command.

The primary power and ground nets are used to define the main power connections for the power domain.

The backup power and ground nets are used to define power connections for always-on logic, retention registers, isolation cells, and enable-level shifter cells.

The internal power and ground nets are used to connect power nets to the switching cells present inside the power domain.

EXAMPLES

The following example connects power net information to the TOP_DOMAIN and SUB_DOMAIN power domains:

```
prompt> connect_power_domain TOP_DOMAIN \
           -primary_power_net T_VDD \
           -primary_ground_net T_VSS
1

prompt> connect_power_domain SUB_DOMAIN \
           -primary_power_net A_VDD \
           -primary_ground_net A_VSS \
           -backup_power_net VDD_Backup \
           -backup_ground_net VSS_Backup
1
```

SEE ALSO

[report_power_domain\(2\)](#)

connect_power_net_info

Connects the specified power net information to the specified power pins. This command is supported only in non-UPF mode.

SYNTAX

```
status connect_power_net_info
object_list
-power_pin_name power_pin_name
-power_net_name power_net_name
```

Data Types

<i>object_list</i>	list
<i>power_pin_name</i>	string
<i>power_net_name</i>	string

ARGUMENTS

<i>object_list</i>	Specifies the leaf cells for which the power net information connections are made.
-power_pin_name <i>power_pin_name</i>	Specifies the name of the power pin.
-power_net_name <i>power_net_name</i>	Specifies the name of the power net.

DESCRIPTION

The **connect_power_net_info** command makes power net information connections for a specific power pin of a leaf cell. The pin-level connection overrides the domain-level connections made with the **connect_power_domain** command.

See the **report_power_pin_info** command man page for more information.

EXAMPLES

The following example connects the power net information for the PWR pin of the PD0_INST/I0 cell:

```
prompt> connect_power_net_info PD0_INST/I0 \
          -power_pin_name PWR -power_net_name exp_VDD
1
```

SEE ALSO

[connect_power_domain\(2\)](#)

[connect_power_net_info](#)

```
disconnect_power_net_info(2)
report_power_pin_info(2)
```

connect_power_switch

Connects switch pins of the power switches in the design.

SYNTAX

```
int connect_power_switch
-source object
-port_name port_name
-mode hfn | daisy
[-ack_out object]
[-ack_port_name port_name]
[-direction horizontal | vertical]
[-verbose]
[-voltage_area list]
[-object_list objects]
[-lib_pin library_pin_names]
```

Data Types

<i>object</i>	collection
<i>port_name</i>	string

ARGUMENTS

-source *object*
Specifies the pin or port from which to connect. The direction of the pin or port cannot be inout.

-port_name *port_name*
Specifies the base name to use as names of switch ports when a new port is created on subdesigns to make the connection. It is required option.

-mode hfn | daisy
Specifies whether the switch connections are to be made in daisy chain or high fanout style. It is a required option.

-ack_out *object*
Specifies the pin or port that is to be used as acknowledge-out signal. It is optional and is only allowed in -mode *daisy*.

-ack_port_name *port_name*
Specifies the base name to use as names of acknowledge ports when a new port is created. This is required with -ack_out option in -mode *daisy*.

-direction horizontal | vertical
Specifies the direction for the daisy mode connections. Requires -mode *daisy*. It is used only when tool tries to infer the daisy chained connections based on the instantiated switch cells. The option can only be used with -mode *daisy* and is mutually exclusive to -object_lists.

-verbose
Specifies that the tool displays individual netlist operations while making

the global connections.

-voltage_area list
 Specifies the voltage areas. The patterns can be a collection handle of voltage areas or name patterns. The command will try to collect the switches in the specified voltage area and connect them. If specified with **-object_list**, the command will ignore switches in the object_list which are not in specified voltage areas.

-object_list objects
 Specifies the ordered list of cells on which to perform the connections. In **-mode daisy**, the connections will be made in the order in which they are specified, **-direction** cannot be used with this option.

-lib_pin library_pin_names
 Specifies the list of library input and output pins that should be used in **-mode daisy**. This is required option for the switch cells that have multiple switch and acknowledge pins. Command will error out if a switch cell with multiple input/output is used but does not have its lib pins specified in this option. This can be used only with **-mode daisy** if required.

DESCRIPTION

The `connect_power_switch` command performs the connections for the switch cells instantiated and placed in the design based on user's requirements. The command can identify the switch cells in the design based on liberty syntax, and can connect them in either high-fanout style or daisy-chain style.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLE

The following example connects the switches in mode daisy.

```
prompt> connect_power_switch \
    -source enable \
    -port_name enable_va_0 \
    -mode daisy \
    -direction horizontal \
    -voltage_area voltage_area_2
    -verbose
```

1

SEE ALSO

```
create_power_domain(2)
create_voltage_area(2)
```

connect_spare_diode

Uses the spare diode ports found in the design to fix antenna violations.

SYNTAX

```
status connect_spare_diode
[-exclude_nets collection_of_nets]
[-antenna_check_engine internal | hercules]
[-internal_check_option all | top_layer_only]
[-routing skip | route]
[-distance distance_number]
[-signal_route_options ignore_lower_layers | include_lower_layers | include_all_lower
_layers | advanced]
[-max_ratio max_ratio_number]
```

Data Types

<i>collection_of_nets</i>	collection
<i>distance_number</i>	integer
<i>max_ratio_number</i>	integer

ARGUMENTS

```
-exclude_nets collection_of_nets
    Specifies a collection of nets that should not be connected to diodes. If you
    do not specify this option, all nets will be connected to diodes.

-antenna_check_engine internal | hercules
    Specifies either the internal antenna checker or Hercules. The default is
    internal.

-internal_check_option all | top_layer_only
    Specifies to report either all antenna rule violations or only the top-layer
    antenna violations. The default is all. This option applies only when -  

    antenna_check_engine internal is specified.

-routing skip | route
    Specifies the extent of the routing process. Using skip stops routing. Using
    route invokes the detail router in ECO mode to route diode ports. The default
    is route.

-distance distance_number
    Specifies the maximum distance to search for spare diodes. The default value
    is 10 times the global route cell size.

-signal_route_options ignore_lower_layers | include_lower_layers |
    include_all_lower_layers | advanced
    Specifies the HPO signal route options for checking a charge-collecting
    antenna. The default is the value of the doAntennaConx detail routing option.
```

```
-max_ratio max_ratio_number
    Specifies the maximum allowable ratio of wiring area and gate area for
    checking a charge-collecting antenna.
```

DESCRIPTION

This command uses spare diodes in the design to fix antenna violations. First, the tool runs the internal antenna checker or uses Hercules output to identify antenna violations. For each antenna violation, this command searches the neighborhood of the antenna for spare diodes. The number of required diode ports is determined by **define_antenna_rule** and **define_antenna_layer_rule**.

When enough diode ports are found to fix an antenna violation, it sets the net ID of all the selected diode ports to be the same as the net ID of the antenna to establish the net connectivity. Finally, you might choose to complete the routing of the connected diode ports.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of the **connect_spare_diode** command.

```
prompt> connect_spare_diode -antenna_check_engine internal \
-internal_check_option top_layer_only \
-signal_route_options include_all_lower_layer \
-max_ratio 1000
```

The following is an example of the **connect_spare_diode** command.

```
prompt> connect_spare_diode -route skip -distance 10
```

SEE ALSO

```
insert_diode(2)
define_antenna_rule(2)
define_antenna_layer_rule(2)
```

connect_supply_net

Connects the supply net to the specified supply ports and pins. This command is supported only in UPF mode.

SYNTAX

```
status connect_supply_net
supply_net_name
-ports list
```

Data Types

<i>supply_net_name</i>	string
<i>list</i>	list

ARGUMENTS

<i>supply_net_name</i>	Specify the name of the supply_net to be connected. If a supply net with the specified name, does not exist in the current scope, the supply_net cannot be connected. This is a required option and must be specified.
<i>-ports list</i>	Specify which supply ports or pins are to be connected with the supply_net. The name is hierarchical name.

DESCRIPTION

The **connect_supply_net** command provides an explicit connect of a supply_net to any supply_ports/pins and overrides (has higher precedence than) the auto-connection semantics that might otherwise apply. If a design element isn't connected explicitly to any supply_net using connect_supply_net, it will share the primary power/ground supply_net with the power_domain it belongs to.

The supply_net must be created on the same power_domain as the supply_port before they could be connected. The instance which contains the pin must also be in the extend of the same power_domain. If the specified supply_net/support_port/pin are not in the extend of same power_domain, this command fails.

Command returns 1 on success, returns 0 otherwise.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example connects a supply_net VSS with support_port VSS:

```
connect_supply_net
```

```
prompt> create_power_domain PD1 -elements INST_1 PD1 prompt> create_supply_net VSS -  
domain PD1 VSS prompt> create_supply_port VSS -domain PD1 VSS prompt>  
connect_supply_net VSS -ports VSS 1
```

SEE ALSO

`create_supply_net(2)`
`report_supply_net(2)`

connect_tie_cells

Instantiates tie-high and tie-low cells and connects them to the specified cell ports.

SYNTAX

```
status connect_tie_cells
-objects {object_coll}
-obj_type port_inst | cell_inst | lib_cell
[-tie_high_lib_cell lib_cell]
[-tie_low_lib_cell lib_cell]
[-tie_highlow_lib_cell lib_cell]
[-tie_high_port_name port]
[-tie_low_port_name port]
[-max_fanout number]
[-max_wirelength number]
[-incremental true | false]
```

Data Types

<i>object_coll</i>	collection
<i>lib_cell</i>	string
<i>port</i>	string
<i>number</i>	integer

ARGUMENTS

```
-objects {object_coll}
    Specifies the objects from which the tool infers the ports to which the tie-
    high and tie-low cells are connected. The objects can be cell instances, port
    instances, or reference cells.

-obj_type port_inst | cell_inst | lib_cell
    Identifies the type of object specified in the -objects option.

-tie_high_lib_cell lib_cell
    Specifies the reference cell used to instantiate the tie-high cells. The tool
    determines the number of tie-high cells to instantiate. Optional

-tie_low_lib_cell lib_cell
    Specifies the reference cell used to instantiate the tie-low cells. The tool
    determines the number of tie-low cells to instantiate. Optional

-tie_highlow_lib_cell lib_cell
    Specifies the reference cell used to instantiate the tie-highlow cells. The
    tool determines the number of tie-highlow cells to instantiate. Optional

-tie_high_port_name port
    Specifies the name of the port that is logic high on tie-highlow cell.
    Required if -tie_highlow_lib_cell flag is used.
```

-tie_low_port_name *port*
 Specifies the name of the port that is logic low on tie-highlow cell. Required if -tie_highlow_lib_cell flag is used.

-max_fanout *number*
 Specifies the maximum number of ports that can be driven by single tie-high or tie-low cell.
 If you do not specify this option, the maximum fanout is 8.

-max_wirelength *number*
 Specifies the maximum Manhattan wirelength in microns from a tie-high or tie-low cell to each driven cell port.
 If you do not specify this option, the maximum wirelength is 100.

-incremental true | false
 Specifies whether to run in incremental mode.
 By default (false), the command removes all existing tie cells of the specified ports. In incremental mode, existing tie cells that satisfy the wirelength and fanout constraints are not deleted. This provides minimum disruption to the existing placement and routing.

DESCRIPTION

This command specifies the cell ports to which to connect to tie-high and tie-low cells. It instantiates the tie-high and tie-low cells and makes the necessary connections. Before you run this command, the design must be fully placed and connected to power and ground.

A tie-high cell is a special standard cell whose output pin is always at logic high. A tie-low cell is a special standard cell whose output pin is always at logic low. A tie-highlow cell is a combination cell with two output pins, one at logic high; the other at logic low. In some designs, unused input pins cannot be tied directly to the power or ground net and tie-high, tie-low, or tie-highlow cells must be used.

You may choose to specify the library reference cells associated with the tie-high and tie-low cells only. Then the ports that are tied off to power or ground will be connected to tie cells. Alternately, you may provide the library reference cell of the tie-highlow cell instead. If a two-pin tie-highlow cell is desired you must specify the port names of the pins that are logic high and low. Then the ports tied off to power or ground will be connected to the high or low, respectively, port of the tie-highlow cell. You may also specify both one output tie-high and tie-low library reference cells and two output tie-highlow library reference cell. In that case, in regions of the chip where both ports tied off to power and ground are present, the tool will use tie-highlow cells, otherwise tie-high or tie-low cells will be chosen instead. If a tie-highlow option is not used, then both tie-high and tie-low options must be used.

The cell ports to connect to the tie-high and tie-low cells are inferred from the specified list of cell instances, port instances, or reference cells.

You can specify maximum fanout (the maximum number of ports that can be driven by a single tie-high or tie-low cell) and maximum wirelength (the maximum Manhattan wire length between a tie-high or tie-low cell and a driven port) constraints.

The command can also be run in incremental mode.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLE

In the following example, all input ports of cells "BONUS_SET_*//*" that are tied off to power or ground are connected to new tie-high and tie-low cells.

```
prompt> connect_tie_cells -objects [get_cells "BONUS_SET_*//*"] \
    -obj_type cell_inst \
    -tie_high_lib_cell TIEH -tie_low_lib_cell TIEL
```

In the following example, all input ports named "A" of cells "BONUS_SET_*//*" that are tied off to power or ground are connected to new or existing tie-high and tie-low cells that are at most 64 microns of Manhattan distance away.

```
prompt> connect_tie_cells -objects {"BONUS_SET_*//*/A"} \
    -obj_type port_inst \
    -tie_high_lib_cell TIEH -tie_low_lib_cell TIEL \
    -max_wirelength 64 -incremental true
```

In the following example, all input ports of cells "BONUS_SET_*//*" that are tied off to power or ground will be connected to new tie-highlow cells. Ports that are tied off to power will be connected to port "OUT1" on cell TIEHL. Ports that are connected to ground will be connected to port "OUT0" on cell TIEHL.

```
prompt> connect_tie_cells -objects [get_cells "BONUS_SET_*//*"] \
    -obj_type cell_inst \
    -tie_highlow_lib_cell TIEHL \
    -tie_high_port_name OUT1 \
    -tie_low_port_name OUT0
```

convert_from_polygon

Fracture a polygon into a list of rectangles, which are mutually exclusive.

SYNTAX

```
list convert_from_polygon  
polygon  
[-format format]
```

Data Types

polygon list

ARGUMENTS

polygon

One polygon which is represented as a list of points. The format for a polygon is: $\{\{x_1\ y_1\}\ \{x_2\ y_2\}\ \dots\ \{x_N\ y_N\}\ \{x_1\ y_1\}\}$. Besides, a list of one polygon is also supported as input for this option, with the format: $\{\{\{x_1\ y_1\}\ \{x_2\ y_2\}\ \dots\ \{x_N\ y_N\}\ \{x_1\ y_1\}\}\}$. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron).

-format format

Specify the output format of result rectangles, *format* can be *polygon* or *rectangle*. If *-format polygon* is specified, each result rectangle will be represented in polygon format like: $\{\{x_1\ y_1\}\ \{x_2\ y_2\}\ \{x_3\ y_3\}\ \{x_4\ y_4\}\ \{x_1\ y_1\}\}$; otherwise in default format: $\{x_1\ y_1\}\ \{x_2\ y_2\}$.

DESCRIPTION

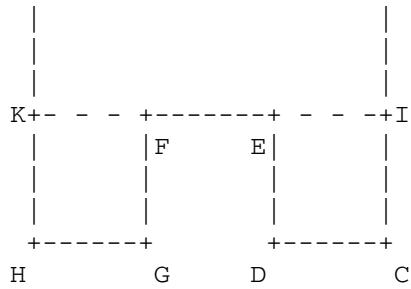

This command converts a polygon into a list of rectangles, which are mutually exclusive. Each returned rectangle will be represented as Tcl list of coordinates.

Before this command is used, the library should be opened. It is important to note that this command may return a list of rectangles which represent a disjoined rectilinear region. So do not directly pass the result of this command as a parameter to another polygon command. Tcl list command like **foreach**, **lindex** can be used to extract each rectangle from the returned list, and then pass each rectangle to other polygon command.

EXAMPLES

The following example converts the polygon A-B-C-D-E-F-G-H-A to three rectangles K-F-G-H, E-I-C-D and A-B-I-K.

```
A           B  
+-----+  
|       |
```

```
Prompt> convert_from_polygon {{0 20} {30 20} {30 0} {20 0} {20 10}
{10 10} {10 0} {0 0} {0 20}}
{{0 10} {10 10} {10 0} {0 0} {0 10}} {{20 10} {30 10} {30 0} {20 0} {20 10}}
{{0 20} {30 20} {30 10} {0 10} {0 20}}
```

SEE ALSO

`convert_to_polygon(2)`
`compute_polygons(2)`
`resize_polygon(2)`

convert_mw_lib

Converts a Milkyway library's cell data.

SYNTAX

```
status convert_mw_lib
mw_lib
[-cell_name cell_name]
[-all]
[-previous]
```

Data Types

<i>mw_lib</i>	string
<i>cell_name</i>	string

ARGUMENTS

<i>mw_lib</i>	Specifies the library containing the cells to be converted.
<i>-cell_name cell_name</i>	Specifies the name of cell to be converted. If the option is specified, all child soft macro cells referred by the current cell will be converted along with the current cell.
<i>-all</i>	If the option is specified, all cells under the design lib will be converted.
<i>-previous</i>	If the option is specified, the cell would be converted to the previous schema version. This option is only supported in IC Compiler.

DESCRIPTION

This command converts cells of the specified library. It does not convert cells in the reference libraries.

If a cell was created by a prior release, it is old and must be updated before it is opened by the current release. Once updated, the cells may be used by any tool from the current release.

It is recommended to convert all cells once using this `convert_mw_lib` command. This minimizes run-time and memory consumption for conversion and would have less impact to the ICC flow. If an old cell is not converted, the `open_mw_cel` command will open the old cell and automatically convert it in memory. If the user does not save the cell, the cell will be automatically converted again during the next `open_mw_cel` command call.

EXAMPLES

```
convert_mw_lib foo_library -cell_name top  
1  
convert_mw_lib foo_library -all -previous  
1
```

SEE ALSO

```
open_mw_cel(2)  
save_mw_cel(2)
```

convert_to_polygon

Returns a polygon from any supported object.

SYNTAX

```
list convert_to_polygon
[-quiet]
object_spec
```

Data Types

object_spec string

ARGUMENTS

-quiet

Indicates that error and warning messages are not to be reported.

object_spec

Specifies a single object from which to get the polygon. This option should be a collection consisting of exactly one supported object.

DESCRIPTION

This command returns a polygon calculated from the input object. The option *object_spec* should be a collection consisting of exactly one object. The supported object classes are *shape*, *placement_blockage*, *route_guide*, and the supported class type can be extended in the future.

The returned polygon is represented as a Tcl list of coordinates. If the input object is polygon type, this command will just output the points of the polygon; if the input object is rectangle or path type, this command will use its information to calculate the corresponding polygon.

EXAMPLES

The following example returns a polygon from net_shape RECTANGLE#123.

```
Prompt> convert_to_polygon [get_net_shapes RECTANGLE#123]
{{99.490 111.340} {117.590 111.340} {117.590 111.620} {117.590 99.490}
{99.490 111.340}}
```

SEE ALSO

`convert_from_polygon(2)`
`resize_polygon(2)`

convert_wire_ends

Converts the currently opened cell's signal wire ends.

SYNTAX

```
status_value convert_wire_ends
```

ARGUMENTS

no arguments

DESCRIPTION

This command searches the currently opened cell for signal wires having zero length extensions. Each of these wires is converted into a wire having half width extensions. If the wire is not convertible (i.e., the wire length is less than the width), the wire is deleted.

This command only modifies wires having a signal route type.

The command returns a status indicating success or failure.

EXAMPLES

The following example converts the "top" cell's zero length extension wires into half width extension wires.

```
prompt > open_mw_lib myLib
{myLib}
prompt > open_mw_cel top
{top}
prompt > convert_wire_ends

```

convert_wire_to_pin

Converts wires to pins for either all nets or specified nets in the selected wire set.

SYNTAX

```
status convert_wire_to_pin
[-net_names net_names]
objects
```

Data Types

<i>net_names</i>	collection
<i>objects</i>	collection

ARGUMENTS

-net_names *net_names*
Specifies net names to filter selected wires. The *net_names* argument is a collection of net names.

objects
Specifies a selected wire set as a collection of wires.

DESCRIPTION

This command searches the specified nets and converts the selected wires of the nets into pins. You must manually select the wires by GUI first.

The successive command **create_macro_fram** can extract those detailed pins converted from wires in the FRAM view. If the *net_names* argument is NULL, all selected wires are converted to their corresponding pins. Otherwise, only the selected wires that belong to the specified *net_names* are converted to pins.

NOTES

Only the wire section connecting to a pin is converted to a pin. If no corresponding pin of selected wires exists in the top cell, nothing is converted. That is, no new pin is created in the top cell (no net list changes).

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example converts user-selected wires of the nets named *OR* and *SCEN*) to pins.

```
prompt> convert_wire_to_pin -net_names {OR SCEN} [get_selection]
```

SEE ALSO

`create_macro_fram(2)`
`get_selection(2)`

copy_collection

Duplicates the contents of a collection, resulting in a new collection. The base collection remains unchanged.

SYNTAX

```
collection copy_collection  
collection1
```

Data Types

```
collection1      collection
```

ARGUMENTS

```
collection1  
Specifies the collection to be copied. If the empty string is used for the  
collection1 argument, the command returns the empty string: A copy of the  
empty collection is the empty collection.
```

DESCRIPTION

Creates a duplicate of an existing collection by using an efficient mechanism. It is more efficient, and almost always sufficient, to simply have more than one variable reference the same collection, as described below. For example, if you create a collection and save a reference to it in a variable named *c1*, assigning the value of *c1* to another variable named *c2* simply creates a second reference to the same collection:

```
prompt> set c1 [get_cells "U1*"]  
{"U1", "U10", "U11", "U12"}  
prompt> set c2 $c1  
{"U1", "U10", "U11", "U12"}
```

This procedure creates two references to the same collection, but this has not copied the collection. If you change the *c1* variable, *c2* continues to reference the same collection:

```
prompt> set c1 [get_cells "block1"]  
{"block1"}  
prompt> query_objects $c2  
{"U1", "U10", "U11", "U12"}
```

However, there might be instances when you really do need a copy; and, in those cases, you can use the **copy_collection** command to create a new collection that is a duplicate of the original.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the result of copying a collection. Functionally, it is not much different than having multiple references to the same collection.

```
prompt> set c1 [get_cells "U1*"]
{"U1", "U10", "U11", "U12"}
prompt> set c2 [copy_collection $c1]
{"U1", "U10", "U11", "U12"}
prompt> unset c1
prompt> query_objects $c2
{"U1", "U10", "U11", "U12"}
```

SEE ALSO

[collections\(2\)](#)

copy_floorplan

Copies floorplan data from a specified design to the current design in a Milkyway design library.

SYNTAX

```
status copy_floorplan
[-library design_library_name]
-from design_name
[-macro]
[-filler]
[-pad]
[-power_plan]
[-verbose]
[-incremental]
```

Data Types

<i>design_library_name</i>	string
<i>design_name</i>	string

ARGUMENTS

```
-library design_library_name
    Specifies the name of the Milkyway design library for the source and
    destination designs. If this option is not specified, the current open
    library is used. If no library is currently open, this option is required.

-from design_name
    Specifies the name of the source design. The source design must be specified,
    otherwise, the copy_floorplan command will not execute.

-macro
    Copy placement of macros. Placement here includes position, orientation,
    fixed or placed status and so on.

-filler
    Copy placement of filler cells. Placement here includes position,
    orientation, fixed or placed status and so on.

-pad
    Copy placement of I/O pads, corner pads and flip chip pads. Placement here
    includes position, orientation, fixed or placed status and so on.

-power_plan
    Copy power net connections and routing.

-verbose
    Print detailed message and statistics on data copied and not copied.

-incremental
    Do not update the existing named objects in the destination design. Can be
```

combined with all other options.

DESCRIPTION

The **copy_floorplan** command copies floorplan data from a specified design to the current design in a Milkyway design library, and the current design must be opened before the command is executed. Floorplan data includes die area, core area, rows, wire tracks, placement and routing obstructions, bounds, groups and regions, power domains and voltage areas, the XY coordinates of cell instances and top level pins, routes, and power net connections.

Use this command after floorplanning is done, but before standard cell placement and routing is done, which is an early stage in an implementation flow.

The source design and the current design are Milkyway cells and must exist in the same design library. And you must specify the -from option to indicate the source design. If you do not specify the type of data to copy (**-macro**, **-filler**, **-pad**, or **-power**), the command copies all existing floorplan data from the source design to the current design. Otherwise, only the data specified by the options is copied.

The command does not do a complete netlist comparison. It goes through the netlist of the source design and looks for the objects by name in the destination design. By default, if a cell instance or net does not exist in the destination design, it is skipped.

The command returns 1 on success, 0 on failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example copies the macro and pad placement information from design A to the current design in design library mwlib.

```
prompt> copy_floorplan -library mwlib -from A -macro -pad
```

The following example copies all floorplan information from design A to the current open design, printing detailed information about the copy process.

```
prompt> copy_floorplan -from A -verbose
```

SEE ALSO

`write_floorplan(2)`

copy_mim

Copies cell placement, blockages, or shape from one multiple instantiated module (MIM) plan group to others in same group.

SYNTAX

```
status copy_mim
[-type placement | blockage | boundary]
[-restore_placement]
collection
```

Data Types

collection list containing one plan group

ARGUMENTS

[-type placement | blockage | boundary]

Identifies the type of copy desired. The **placement** argument copies the cell placement of the given MIM to all other MIMs in the same group. The **blockage** argument copies all types of placement blockages overlapping the given MIM to all other MIMs in the same group. The **boundary** argument copies the MIM shape from the given MIM to all other MIMs in the same group. The default is **placement**.

[-restore_placement]

Restores the placement of cells in the MIM group of the MIM specified by **placement**. This option undoes the result of the previously-executed **copy_mim -type placement** command. This works even if you exit and restart the tool as the original placement (that is, before the **copy_mim -type placement**) is saved to the database.

collection

Specifies a collection containing one MIM plan group. This is the source MIM to copy to all other MIMs in the same group.

DESCRIPTION

This command performs various manipulations on MIMs. MIMs are modules that have the same reference. A set of these modules is called a MIM group. A design can have more than 1 MIM group. For example, if modules A1 and A2 have reference A and modules B1 and B2 have reference B, they form 2 MIM groups.

The command performs manipulations during the virtual flat stage. This is the period when MIMs are physically represented in the design as plan groups. You can use this command to create MIMs with the same cell placement, blockages, and shapes.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example copies the placement of a MIM plan group, M1, to MIM plan groups M2 and M3.

```
prompt> copy_mim -type placement M1
```

The following example assumes you have created placement blockages in M1 that you want copy to M2 and M3.

```
prompt> copy_mim -type blockage M1
```

The following example shows how to undo the placement of M1, M2, and M3; that is, to restore placement to the state before the execution of a **copy_mim -type placement M1** command.

```
prompt> copy_mim -restore_placement M1
```

Note that this command undoes only the placement, not the blockage copy.

SEE ALSO

`flip_mim(2)`
`report_mim(2)`

copy_mw_cel

Copies Milkyway designs from a source design library to a target design library.

SYNTAX

```
status copy_mw_cel
-from source_mw_cel_name
[-to target_mw_cel_name]
[-from_library source_library_name]
[-to_library target_library_name]
[-hierarchy]
[-check_only]
[-overwrite]
```

Data Types

source_mw_cel_name	collection
target_mw_cel_name	string
source_library_name	string
target_library_name	string

ARGUMENTS

-from source_mw_cel_name

Specifies the Milkyway designs to be copied. If you use the **-hierarchy** option, you can specify only a single design. If you do not use the **-hierarchy** option, you can specify a single design or multiple designs.

You can specify a Milkyway design by name, pattern, or collection. For example, top matches a Milkyway design named top in the current design library; top* matches all Milkyway designs whose names start with top; and * specifies all Milkyway designs in the current design library.

If you specify a version in the source file name, only that version of the Milkyway design is copied. If you do not specify a version in the source file name, the latest version of the Milkyway design is copied.

-to target_mw_cel_name

Specifies the name of the target Milkyway design.

If you specify multiple source Milkyway designs in the **-from** option, the tool assumes that you want to copy them without changing the names, so it ignores this option.

If you use both this option and the **-hierarchy** option, specify only the top-level design name as *target_mw_cel_name*, because it is the only Milkyway design name that can be changed.

If you do not specify this option, the source Milkyway designs are copied to the target library without changing the name.

-from_library source_library_name

Specifies the design library that contains the source Milkyway designs.

If you use patterns, such as "top" or "*", to specify the source Milkyway designs in the **-from** option, the tool ignores this option. All patterns are matched in the current design library.

If you do not specify this option, the tool uses the current design library

as the source library.

-to_library target_library_name

Specifies the target library to which the Milkyway designs are copied.

Generally, you do not need to open the target library before running this command.

If you use both this option and the **-hierarchy** option, and the specified target design library does not exist, the tool creates a new library and copies the hierarchical design into it.

If you do not specify this option, the tool uses the current design library as the target library.

-hierarchy

Copies the source Milkyway design and its subdesigns to the target design library.

-check_only

Prints the list of Milkyway designs, views, and versions but does not copy the designs. This option is valid only when used with the **-hierarchy** option.

-overwrite

Overwrites the target Milkyway design when copying. This option cannot be used with the **-hierarchy** option.

DESCRIPTION

This command copies the specified Milkyway designs from the source design library to the target design library. You must have write permission for the target design library. Only read permission is required for the source design library.

You can use the **-hierarchy** option to copy both the top-level design and its subdesigns. Subdesigns that are instantiated from the reference library stay in the reference library and are not copied to the target design library. The target library sets the reference path to those reference libraries. The latest version of any open and unsaved Milkyway design in the hierarchical tree is saved from memory into the target design library. If the open Milkyway design is not the latest version, the Milkyway design is copied from disk instead of memory. If the Milkyway design is not open, the Milkyway design on disk is copied.

The copied Milkyway designs include all information from the original Milkyway design. The copied Milkyway designs have their versions set to 1 if the target library is a new library. If the target library is not a new library, the version of the copied Milkyway design is incremented by 1 from the latest version before the copy, unless you use the **-overwrite** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example copies version 2 of a design named test to a design named

bill. Both test and bill are in the current design library.

```
prompt> copy_mw_cel -from "test.CEL;2" -to bill
1
```

The following example copies all Milkyway designs from the current library to another library named new_lib.

```
prompt> copy_mw_cel -from * -to_library new_lib
1
```

The following example copies the design named ORCA and all of its subdesigns from the current library to a library named lib1.

```
prompt> copy_mw_cel -hierarchy -to_library lib1 -from ORCA
Copied Library Files
From: /orca/orca_lib
To: lib1
```

```
Copied Cells
From: /orca/orca_lib
To: lib1
```

```
Copying cell: ORCA.CEL;1
Copying cell: BLENDER_2;
1
```

SEE ALSO

```
close_mw_cel(2)
create_mw_cel(2)
current_mw_cel(2)
get_mw_cels(2)
open_mw_cel(2)
remove_mw_cel(2)
rename_mw_cel(2)
```

copy_mw_lib

Copies a Milkyway library to another location.

SYNTAX

```
status copy_mw_lib
[-from mw_lib | -from_lib_id lib_id]
-to lib_name
```

Data Types

<i>mw_lib</i>	string
<i>lib_id</i>	int
<i>lib_name</i>	string

ARGUMENTS

-from *mw_lib*

Specifies the name of the source Milkyway library to be copied. The *mw_lib* value can be a library name or a collection of libraries. The **-from** and **-from_lib_id** options are mutually exclusive. By default, the command uses the current Milkyway library.

-from_lib_id *lib_id*

Specifies the ID of the source Milkyway library to be copied. The **-from** and **-from_lib_id** options are mutually exclusive. By default, the command uses the current Milkyway library.

-to *lib_name*

Specifies the destination Milkyway library name.

DESCRIPTION

This command copies a Milkyway library to another location. It returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example copies a Milkyway library design to another location.

```
prompt> copy_mw_lib -from design -to design.bak
1
```

SEE ALSO

`rename_mw_lib(2)`

copy_objects

Copies one or more objects.

SYNTAX

```
new_objects copy_objects
[-delta vector]
[-to point]
[-use_same_net]
objects
```

Data Types

objects collection

ARGUMENTS

-delta vector
Specifies the displacement to move the copied object from the original object's position.

-to point
Specifies the absolute position of the copied object.

-use_same_net
Specifies whether the copied object should be connected to the same net as the original object. If not specified the object is unconnected.
Note: Only applicable to objects that can have net connections.

objects
Specifies the objects to be copied.

RETURNS

new_objects
Contains a collection of the copied objects.

DESCRIPTION

This command copies one or more objects and can optionally place the new objects at a new location or a delta from the original location.

In general all attributes of an object are copied. There are a few exceptions to this rule:

- The new object will have a different database id than the original (this is required as all database ids must be unique).

- The new object will be, by default, not be connected to the same net as the original object unless the **-use_same_net** option.
- The new object will be at a different position if either the **-delta** or **-to** options are specified.

See `get_edit_property(2)` man page for more details on which objects can be copied.

Note: Snapping of the position of the new object is done automatically using global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example copies the currently selected object placing the copied object 100 units to the right and 200 units above the original object.

```
prompt> copy_objects -delta {100 200} [get_selection]
```

SEE ALSO

```

flip_objects(2)
set_object_snap_type(2)
get_object_snap_type(2)
```

count_drc_violations

Returns the number of design rule constraint (DRC) violations.

SYNTAX

```
int count_drc_violations
[-intersect bbox]
[-ignoring bbox]
[-include_types types]
[-ignore_types types]
[-include_layers layers]
[-ignore_layers layers]
[-use_new_drc]
[-drc_cell_name drc_cell_name]
[-return_error_type]
[-verbose]
```

Data Types

<i>bbox</i>	bounding box
<i>types</i>	string or list of strings
<i>layers</i>	string or list of strings
<i>drc_cell_name</i>	string

ARGUMENTS

-intersect *bbox*

Include DRC violations within or touching this bounding box.

-ignoring *bbox*

Ignore DRC violations completely within this bounding box.

-include_types *types*

Include DRC violations of these types. Use -verbose to find type names.

-ignore_types *types*

Ignore DRC violations of these types. Use -verbose to find type names.

-include_layers *layers*

Include DRC violations on these layers. Use -verbose to find layer names.

-ignore_layers *layers*

Ignore DRC violations on these layers. Use -verbose to find layer names.

-use_new_drc

Use the geNewdrc DRC error cell. This is already the default.

-drc_cell_name *drc_cell_name*

Specify a particular DRC error cell name. Use topCellName for the verify_route results. Use topCellName_aDRC.err for the verify_drc results.

```
-return_error_type  
    Returns the name of the error type found (if there are multiple errors , it  
    returns the first one).  
  
-verbose  
    Report all the DRC violations in full form.
```

DESCRIPTION

This command reports the number of DRC errors of the specified types, on the specified layers, within the given domain. It also lists the DRC error if -verbose is selected.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> count_drcViolation -verbose
```

SEE ALSO

```
verify_route(2)  
verify_drc(2)
```

cputime

Reports the CPU time in seconds.

SYNTAX

```
int cputime  
[-all]  
[-verbose]
```

ARGUMENTS

```
-all  
      Report the total CPU time of the main process and its child processes.  
  
-verbose  
      Report in detail the CPU time and elapsed (wall-clock) time of the main  
      process and each child process, including placement, extraction, and routing.
```

DESCRIPTION

This command reports the CPU time in seconds. By default it reports the CPU time for the main processs. If you specify **-all**, it reports the total CPU time of the main process and all its child processes. If you specify both **-all** and **-verbose**, it reports the CPU time and elapsed (wall-clock) time for the main process and each child process. The runtime numbers are collected from the operating system.

When you use the **-num_cpus** option, the tool runs multiple threads. Currently the operating system measures the CPU time by adding the usage for all threads. It does not take into account parallelization of the threads. This means that the report might show a larger CPU time than elapsed time when you specify the **-num_cpus** option.

The elapsed time (wall-clock time) depends on many external factors and can vary for every session. It depends on factors such as the I/O traffic, the network traffic, RAM and swap usage, and the other processes running on the same machine. When the elapsed time is much longer than the CPU time, it might point out an inefficiency of the computing environment, such as insufficient memory, too many processes running on the same machine, or a slow network. The only way to make the elapsed time close to the CPU time is to run only one session on a machine with enough RAM and using the local disk.

EXAMPLES

The following example shows the default command output.

```
prompt> cputime  
1202
```

The following example shows the output when using the **-all** and **-verbose** options.

```
prompt> cputime -all -verbose
```

```
Main process CPU: 1202 s (0.33 hr) Elapse: 1800 s (0.50 hr)
Child "placement" called 3 times, total CPU: 200 s (0.06 hr) Elapse: 250 s (0.07
hr)
Child "extraction" called 2 times, total CPU: 100 s (0.03 hr) Elapse: 150 s (0.0
4 hr)
Total CPU: 1502 s ( 0.42 hr) Elapse: 1800 s ( 0.50 hr)
```

1523

SEE ALSO

`mem(2)`
`monitor_cpu_memory(3)`

create_auto_shield

Performs automatic shield routing.

SYNTAX

```
status create_auto_shield
[-with_ground net_name]
[-nets collection_of_nets]
[-ignore_shielding_net_pins]
[-ignore_shielding_net_rails]
[-coaxial_below]
[-coaxial_above]
```

Data Types

<i>net_name</i>	string
<i>collection_of_nets</i>	collection

ARGUMENTS

-with_ground *net_name*
Specifies which power or ground net to tie the shielding wires to.
By default, the shielding wires are tied to the ground net. If the design contains multiple ground nets, you must use this option to specify the ground net.

-nets *collection_of_nets*
Specifies the nets to be shielded. If the specified nets do not have shielding rules defined, the tool uses the default width and minimum spacing for the layer as defined in the technology file.
By default, this command performs shielding on all nets with defined shielding rules. To define the shielding rules, use the **define_routing_rule** and **set_net_routing_rule** commands.

-ignore_shielding_net_pins
Prevents connection of the shielding wires to the standard cell power or ground (PG) pins.
By default, the shielding wires are connected to the standard cell PG pins.

-ignore_shielding_net_rails
Prevents connection of the shielding wires to the standard cell rails.
By default, the shielding wires are connected to the standard cell rails.

-coaxial_below
Creates coaxial shielding below the shielded net segment layer.
By default, this command does not perform coaxial shielding below the shielded net segment layer.

-coaxial_above
Creates coaxial shielding above the shielded net segment layer.
By default, this command does not perform coaxial shielding above the shielded net segment layer.

DESCRIPTION

The **create_auto_shield** command shields nets based on the associated shielding rules.

By default, the command performs same-layer shielding on all nets with predefined shielding rules. The router routes shielding wires based on the shielding widths and spacing defined in the shielding rules. The shielding wires are tied to the ground net, standard cell ground pins, and standard cell rails.

To explicitly specify the nets on which to perform shielding, use the **-nets** option. To tie the shielding wires to a named power or ground net, use the **-with_ground** option. To prevent connections to the standard cell PG pins, use the **-ignore_shielding_net_pins** option. To prevent connections to the standard cell rails, use the **-ignore_shielding_net_rails** option.

By default, the command does not perform coaxial shielding. To perform coaxial shielding above the shielded net segment layer, use the **-coaxial_above** option. To perform coaxial shielding below the shielded net segment layer, use the **-coaxial_below** option. When the tool performs coaxial shielding, the coaxial shielding segments

- * Are routed in the preferred layer direction
- * Use the defaultWidth layer attribute from the technology file
- * Are spaced such that they leave at least one signal routing resource on each layer

PREREQUISITES

Before you run this command, you must first define the shielding rules with the **define_routing_rule** command and assign these rules to the nets to be shielded with the **set_net_routing_rule** command.

This requirement applies when you do not specify the **-nets** option, you want to use a nondefault width or minimum spacing, or you want to snap the shielding segments to the grid.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines the shielding rules; assigns these shielding rules to all clock nets; and then shields the CLK_B1 clock net with the VSS ground net, the CLK_B2 clock net with the GND ground net, and the CLK_B3 and CLK_B4 clock nets with the VDD power net. The shielding wires are not connected to the standard cell PG pins.

```
prompt> define_routing_rule clock_net_shielding \
-default_reference_rule -taper_level 0 -snap_to_track \
-widths {METAL1 0.16 METAL2 0.2 METAL3 0.2 METAL4 0.2} \
-spacing {METAL1 0.18 METAL2 0.21 METAL3 0.21 METAL4 0.21} \
```

```
-shield_width {METAL1 0.16 METAL2 0.2 METAL3 0.2 METAL4 0.2} \
-shield_spacing {METAL1 0.18 METAL2 0.21 METAL3 0.21 METAL4 0.21} \
-via_cuts {via1 1X1 via2 1X1 via3 1X1}

prompt> set clock_nets [get_nets -filter "net_type == Clock" -hier]

prompt> set_net_routing_rule -rule clock_net_shielding $clock_nets

prompt> create_auto_shield -with_ground VSS -nets {CLK_B1} \
-ignore_shielding_net_pins

prompt> create_auto_shield -with_ground GND -nets {CLK_B2} \
-ignore_shielding_net_pins

prompt> create_auto_shield -with_ground VDD -nets {CLK_B3 CLK_B4} \
-ignore_shielding_net_pins
```

SEE ALSO

define_routing_rule(2)
set_net_routing_rule(2)

create_base_array

Creates a base array record in the design.

SYNTAX

```
status create_base_array
[-tile_name tile_name]
-coordinate rectangle
[-direction direction]
```

Data Types

<i>tile_name</i>	string
<i>rectangle</i>	list
<i>direction</i>	string

ARGUMENTS

-tile_name *tile_name*
Specifies the name of unit tile used in the base array record.
If **-tile_name** is not specified, by default it creates a base array using "unit" as its unit tile.

-coordinate *rectangle*
Specifies the lower left corner and the upper right corner of the base array.
The values are specified in microns relative to the chip origin.

-direction *direction*
Specifies the direction of the base array record.
The validated values of direction can be: horizontal and vertical.
By default, the direction is set to horizontal.

DESCRIPTION

The **create_base_array** command allows you to create a base array record into database.

This command returns 1 if succeeds.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a base array record.

```
prompt> create_base_array -coordinate {{200 200} {1800 1800}} -
```

```
direction horizontal
-tile_name unit
1
```

SEE ALSO

`remove_base_arrays(2)`

create_boundary

Creates a boundary for a design or library cell.

SYNTAX

```
status create_boundary
[-coordinate rectangle
 | -poly {point point ...}
 | -by_terminal]
[-core]
[-left_offset l_offset]
[-right_offset r_offset]
[-top_offset t_offset]
[-bottom_offset b_offset]
[-lib_cell_type type]
```

ARGUMENTS

-coordinate *rectangle*
Creates a boundary using the specified bounding box. This option is mutually exclusive with **-poly** and **-by_terminal**; you can only use one of them. If you do not specify any of these options, the boundary is created according to current boundary. You cannot specify this argument with the **-lib_cell_type** option.

-poly {*point point ...*}
Creates a rectilinear boundary with n points. This option is mutually exclusive with **-coordinate** and **-by_terminal**; you can only use one of them. If you do not specify any of these options, the boundary is created according to current boundary. You cannot specify this argument with the **-lib_cell_type** option.

-by_terminal
Creates a boundary based on the bounding box of all the terminals in the design (if you specify *design*) or the library cells (if you specify **-lib_cell_type**).

-core
Indicates that **-coordinate** also defines the core area for design planning.

-left_offset *l_offset*
Specifies the distance to adjust the left side of the boundary.

-right_offset *r_offset*
Specifies the distance to adjust the right side of the boundary.

-top_offset *t_offset*
Specifies the distance to adjust the top of the boundary.

-bottom_offset *b_offset*
Specifies the distance to adjust the bottom of the boundary.

```
-lib_cell_type type
    Specifies the type of library cell for which to create boundaries. If you
    also specify -by_terminal, the boundary is created based on the terminal
    locations; otherwise the boundary is created based on the current boundary.
    This option and the design argument are mutually exclusive. You cannot use
    this option when you specify the -coordinate or -poly options.
```

DESCRIPTION

The **create_boundary** command allows you to create a boundary for a design or library cells. If you specify **-lib_cell_type**, a boundary is created for all library cells of the specified type. If you specify **design**, a boundary is created for the specified design. If you do not specify either **-lib_cell_type** or *design*, a boundary is created for the current design.

For a design, you can specify the boundary by using the **-coordinate**, **-poly**, or **-by_terminal** option. If you do not specify how to create the boundary, the boundary is created based on the current boundary.

For library cells, you can specify the boundary only by using the **-by_terminal** option.

You can also adjust the boundary by using the **-left_offset**, **-right_offset**, **-top_offset**, and **-bottom_offset** options. However, these four options cannot be used with **-poly**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command creates a boundary for the current design by specifying a bounding box.

```
prompt> create_boundary -coordinate {{0 0} {100 100}}
1
```

The following command creates a boundary for the current design by specifying a point array.

```
prompt> create_boundary -poly {{0 0} {100 0} \
{100 100} {50 100} {50 50} {0 50}}
1
```

The following command creates a boundary for the current design based on its terminal locations and adjusts the left side of the boundary.

```
prompt> create_boundary -by_terminal -left_offset 10
```

1

The following command creates a boundary for all io_pad cells in the reference library.

```
prompt> create_boundary -lib_cell_type io_pad  
1
```

SEE ALSO

create_bounds

Creates a fixed move bound or floating group bound in the design.

SYNTAX

```
int create_bounds
[-name bound_name]
[-coordinate {llx1 lly1 urx1 ury1 ...}]
[-dimension {width height}]
[-effort low | medium | high | ultra]
[-type soft | hard]
[-exclusive]
[-color range_0_to_63]
[-cycle_color]
object_list
```

ARGUMENTS

-name *bound_name*

Specifies the name of the bound.

-coordinate {*llx1 lly1 urx1 ury1 ...*}

Specifies a list of lower left and upper right coordinates of a move bound. Each combination of {*llx lly urx ury*} defines a target placement area for the objects. The areas can overlap or be disjoint. Rectilinear move bounds are allowed, but must be divided into a number of individual rectangular bounds. These rectangles bounds should be specified in this coordinate list. The coordinates are in microns relative to the chip origin.

-dimension {*width height*}

Specifies the dimension of a group bound. The numbers are in microns.

-effort low | medium | high | ultra

Specifies the effort to bring cells closer inside a group bound. The default effort is medium.

-type soft | hard

Specifies the type of the bound to be either hard or soft. Either -coordinate or -dimension must be specified to use this switch. It is not allowed to set the bound type on auto group bounds. The default is to create soft bounds.

-exclusive

Assigns a property type of exclusive to the move bound being created. Move bounds that are exclusive require all of their cells to be placed inside them and prohibit the placement of other cells in the same area. Exclusive move bounds will be respected by both coarse placement and legalization.

-color *range_0_to_63*

Specifies the move bound color. Substitute a value for *range_0_to_63* that is in the range of **0** to **63**, inclusive. The default is **no_color** which is the special value for no user specified color.

```

-cycle_color
    Allows the tool to automatically assign a color. By default, this option is
    off.

object_list
    Specifies a list of cells/ports/pins to be included in the bound. If a cell
    is a hierarchical cell, the bound also be applied to all cells in the
    subdesign. It is an error to include a cell for a move bound which has already
    been assigned to another move bound. The cell list is not mandatory for move
    bound. User can create an empty move bound without specifying any cell lists.
    If a port is a hierarchical port, the corresponding port will be attached to
    the bound instead. If a pin given, the lower left point of the first geometry
    of the pin will be marked on the cell of the pin, and the cell will be added
    to the bound. If a pin is a hierarchical pin, it will be ignored.

```

DESCRIPTION

The `create_bounds` command allows the user to define region-based placement constraints for coarse placement. There are two different types of bounds available: move bounds and group bounds. Move bounds restrict the placement of cells to a specific region of the core area. Move bounds require absolute coordinates to be specified, using the `-coordinate` option. Group bounds, on the other hand, are floating region constraints. Cells in the same group bound will be placed within a specified bound but the absolute coordinates are not fixed. Instead, they are optimized by the placer. The `-dimension` option needs to be specified for a group bound.

Generally, there is no guarantee that cells will be placed completely within bounds. For instance, coarse placement will violate bounds if the quality of its primary placement objectives would otherwise be destroyed.

In these situations, the user should revisit their bounds and floorplan to ensure that the design is not overconstrained. Alternatively, the user can use the "`-type hard`" option to specify the bound type to be hard (the default is soft). The coarse placer will try to honor the hard bound as hard constraints while sacrificing other objectives, such as timing and routability. It is not recommended to use many hard bounds because this will lead to inferior placement solutions.

If `-coordinate` is given, a move bound will be created. If `-dimension` is given, a group bound with the given bounding box will be created. If neither of these two switches is used, a group bound will be created with a bounding box computed internally by the tool. In this case, the user can use `-effort` to specify the effort level to bring cells closer. It is not allowed to use `-effort` when either `-coordinate` or `-dimension` is used. All automatically generated bounds are soft bounds. It is not allowed to use `-type` to change the bound type of these auto group bounds.

If `-coordinate` is given and no cell list is provided as an argument , then an empty move bound will be created. User can later on associate the cells with the particular move bound by using `attach_bounds` command.

If more than one placeable area is defined in the `-coordinate` option, the coarse placement engine can place cells in any of the rectangles. These placeable areas can overlap, or be disjoint. One application of this is to define a rectilinear move

bound by decomposing the original rectilinear move bound into a number of rectangle bounds, and list each rectangle bound in the -coordinate list. The number of parameters in the list must be a multiple of 4.

Placement bounds can alternatively be defined in an input PDEF file. These are hard bounds and will be honored by coarse placement. However, you will not be able to view/remove them by using report_bounds and remove_bounds commands. These two commands work only with the bounds created by the create_bounds command. Rectangular hard move bounds (where -coordinate has only 4 parameters) created by create_bounds can be written out to a PDEF file using the write_pdef command. There is currently no IEEE PDEF support for other types of bounds (soft or rectilinear). However, the bounds created by create_bounds will be persistent in the db. Therefore, if the db is saved and re-loaded, there is no need to re-create them.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example constrains the placement of the instance "INST_1" to lie within the rectangle with lower left corner (100 100) and upper right corner (200 200).

```
prompt> create_bounds -name "foo" -coordinate {100 100 200 200} INST_1
```

The following is an example to create a hard rectilinear move bound on a hierarchical instance "INST2". The rectilinear bound is created as a set of two rectangles [(10 10)(30 20)] & [(20 20)(30 30)] with a common edge.

```
prompt> create_bounds -name "foo2" -coordinate {10 10 30 20 20 20 20 30 30} -
type hard INST_2
```

create_buffer_tree

Creates a buffer tree for the specified driver pins and nets.

SYNTAX

```
status create_buffer_tree
[-from pin_net_list]
[-net_scope]
[-no_legalize]
```

Data Types

pin_net_list collection

ARGUMENTS

-from *pin_net_list*

Specifies the driver pins and nets for which the tool should create buffer trees. When the **-from** argument is not specified, the **create_buffer_tree** command works on all drivers with a transitive fanout of 40 or more.

-net_scope

Sets the scope of buffer tree creation to the specified net, rather than the entire buffer tree driven by the specified net. This option is ignored if **set_ahfs_options -optimize_buffer_trees** is set to false.

When this options is specified **create_buffer_tree** constructs a buffer tree, as needed, on each net specified in the **-from** option to reduce the high-fanout of each net, but does not remove any pre-existing buffers or inverters. Thus the "scope" of the construction is a single specified net.

When this option is not specified, **create_buffer_tree** can remove pre-existing buffers and inverters in the fanout of each specified net to improve QoR.

-no_legalize

Disables placement legalization at the end of buffering.

DESCRIPTION

The **create_buffer_tree** command creates a buffer tree for each specified driver pin and for the driver pin of each specified net.

The **create_buffer_tree** command generates a hierarchical buffer tree (buffers are inserted across hierarchical boundaries). The command is location-based. Therefore, the specified driver pin should not be a hierarchical pin, because a hierarchical pin does not have a location.

This command works *only* on a placed design, and it requires the presence of the following libraries and information:

- The physical libraries that correspond to the specified logical libraries.

- The capacitance and resistance per unit length, derived from the physical library or specified by you.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example creates a buffer tree that is implemented at driver a/0.

```
prompt> create_buffer_tree -from [get_pins a/0]
```

The following example creates buffer trees for driver a/0 and net n1:

```
prompt> create_buffer_tree -from {[get_pins a/0] [get_nets n1]}
```

SEE ALSO

```

report_buffer_tree(2)
report_ahfs_options(2)
report_cbt_options(2)
report_net_fanout(2)
set_ahfs_options(2)
set_cbt_options(2)
```

create_cell

Creates cells in the current design or its subdesigns.

SYNTAX

```
int create_cell
cell_list
reference_name
```

Data Types

<i>cell_list</i>	list
<i>reference_name</i>	string

ARGUMENTS

<i>cell_list</i>	Specifies the names of cells created in the current design. Each cell name must be unique within the current design.
<i>reference_name</i>	Specifies the design or library cell that new cells reference. Ports on the reference determine the name, number, and direction of pins on the new cell.

DESCRIPTION

This command creates new cells in the current design or its subdesigns based on the *cell_list* argument. New cells are the instantiation of an existing design or library cell.

The cells created are unplaced. The cell must be placed either manually, using the **set_cell_location** command or automatically, using placement commands, to be viewed properly in GUI.

To remove cells from the current design, use the **remove_cell** command.

While the *reference_name* argument accepts names in the format *library/library_cell*, it does not imply that the actual library cell used for the new cell will be from the specified library. The actual library cell used will be determined by the current link library settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a cell named *cell1* under the subdesign corresponding to the *mid1* cell.

```
prompt> create_cell {mid1/cell1} my_lib/AND2
Creating cell 'cell1' in design 'mid'.
```

The following example creates cells using library cells as references.

```
prompt> create_cell {U3 U4} my_lib/NAND2
prompt> create_cell "U5" my_lib/NOR2
```

In IC Compiler, reference cells in the physical library can be used without the need for a logical library reference if the physical cell reference has only power and ground pins. This allows you to create some cells (such as filler, power pad, tap, and cap cells) without having logical library references for them. The following example creates a power pad using a physical library reference. No slash is used to designate a library, since there is only one physical library.

```
prompt> create_cell my_power_pad pvdd
```

SEE ALSO

```
remove_cell(2)
report_cell(2)
set_cell_location(2)
```

create_clock

Creates a clock object and defines its waveform in the current design.

SYNTAX

```
status create_clock
[-name clock_name]
[-add]
[source_objects]
[-period period_value]
[-waveform edge_list]
```

Data Types

<i>clock_name</i>	string
<i>source_objects</i>	list
<i>period_value</i>	float
<i>edge_list</i>	list

ARGUMENTS

-name *clock_name*

Specifies the name of the clock being created. If you do not use this option, the clock is given the same name as the first clock source specified in *source_objects*. If you do not use *source_objects*, you must use this option, which creates a virtual clock not associated with a port or pin. Use this option along with *source_objects* to give the clock a more descriptive name than that of the pin or port where it is applied.

If you specify the **-add** option, you must use the **-name** option and the clocks with the same source must have different names.

-add

Specifies whether to add this clock to the existing clock or to overwrite the existing clock. Use this option to capture the case where multiple clocks must be specified on the same source for simultaneous analysis with different clock waveforms. When you specify this option, you must also use the **-name** option. Defining multiple clocks on the same source pin or port causes longer runtime and higher memory usage than a single clock, because the synthesis timing engine must explore all possible combinations of launch and capture clocks. Use the **set_false_path** command to disable unwanted clock combinations. This option is ignored (the default), unless multiple clocks analysis is enabled by setting the **timing_enable_multiple_clocks_per_reg** variable to **true**.

source_objects

Specifies a list of pins or ports on which to apply this clock. If you do not use this option, you must use **-name** *clock_name*, which creates a virtual clock not associated with a port or pin. If you specify a clock on a pin that already has a clock, the new clock replaces the old clock unless you use the **-add** option.

```

-period period_value
    Specifies the period of the clock waveform in library time units.

-waveform edge_list
    Specifies the rise and fall edge times, in library time units, of the clock
    over an entire clock period. The first time in the list is a rising
    transition, typically the first rising transition after time zero. There must
    be an even number of increasing times, and they are assumed to be alternating
    rise and fall times. The numbers must represent one full clock period. If
    -waveform edge_list is not specified, but -period period_value is, a default
    waveform with a rise edge of 0.0 and a fall edge of period_value/2 is assumed.

```

DESCRIPTION

The **create_clock** command creates a clock object in the current design. The command defines the specified *source_objects* as clock sources in the current design. A pin or port can be a source for a single clock. If *source_objects* is not specified, but a *clock_name* is given, a virtual clock is created. A virtual clock can be created to represent an off-chip clock for input or output delay specification. For more information about input and output delay, refer to the **set_input_delay** and **set_output_delay** command man pages.

Clock objects hold attributes that affect the clock network, such as **dont_touch_network**, **fix_hold**, and **propagated_clock**. Using **create_clock** on an existing clock object overwrites the attributes previously set on the clock object. The **create_clock** command also defines the waveform for the clock. The clock can have multiple pulses per period. Setup and hold path delays are automatically derived from the clock waveforms of the path startpoint and endpoint. The **fix_hold** attribute (set by the **set_fix_hold** command) directs **compile** to fix hold violations for a clock.

By default, a new path group is created for the clock. This groups together the endpoints related to this clock for cost function calculation. To remove the clock from its assigned group, use the **group_path** command to reassign the clock to another group or to the default path group. For more information, refer to the **group_path** command man page.

The new clock has ideal timing, so no propagation delay through the clock network is assumed. To enable propagation delay through the clock network, use the **set_propagated_clock** command. To add skew or uncertainty to the ideal waveform, use the **set_clock_latency** or **set_clock_uncertainty** command.

To show information about all clock sources in a design, use the **report_clock** command. To get a list of clock sources, use the **get_clocks** command. To return sequential cells related to a given clock, use the **all_registers** command. To undo **create_clock**, use the **remove_clock** command.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example creates a clock on port PHI1 with a period of 10.0, rise at 5.0, and fall at 9.5:

```
prompt> create_clock "PHI1" -period 10 -waveform {5.0 9.5}
```

In the following example, the clock has a falling edge at 5 and a rising edge at 10, with a period of 10. Because the **-waveform** option expects the edges to be ordered first rise then fall, and to increase in value, the fall edge can be given as 15; that is, the next falling edge after the first rise edge at 10.

```
prompt> create_clock "PHI2" -period 10 -waveform {10 15}
```

The following example creates a clock named CLK on pin u13/Z, with a period of 25, fall at 0.0, rise at 5.0, fall at 10.0, rise at 15.0, and so forth:

```
prompt> create_clock "u13/Z" -name "CLK" -period 25 -waveform {5 10 15 25}
```

The following example creates a virtual clock PHI2 with a period of 10.0, rise at 0.0, and fall at 5.0:

```
prompt> create_clock -name "PHI2" -period 10 -waveform {0.0 5.0}
```

The following example creates a clock with multiple sources and a complex waveform:

```
prompt> create_clock -name "clk2" -period 10 -waveform {0.0 2.0 4.0 6.0} \
{clkgen1/Z clkgen2/Z clkgen3/Z}
```

create_clock_mesh

Creates a grid of horizontal and vertical straps that are joined by vias for clock mesh implementation.

SYNTAX

```
status create_clock_mesh
[-net net]
[-layers hor_ver_list]
[-num_straps hor_ver_list | pitches hor_ver_list
  | -max_pitches hor_ver_list
  | -relative_pitches hor_ver_list]
[-widths hor_ver_list
  | -relative_widths hor_ver_list]
[-keepouts list_of_points]
[-ring]
[-bounding_box rectangle]
[-lower_left hor_ver_list]
[-upper_right hor_ver_list]
[-max_displacement hor_ver_list]
[-load net_or_pins]
[-avoid instances]
[-no_snap]
[-check_only]
[-remove_display]
[-verbose]
[-offset hor_ver_list]
[-full_pitch_perimeter]
[-pitches ]
```

Data Types

<i>net</i>	a net
<i>hor_ver_list</i>	a Tcl list where the first element specifies the horizontal value and the second element specifies the vertical value. The unit for the coordinates and distance values is the library distance unit.
<i>list_of_points</i>	a list of lower left and upper right points
<i>net_or_pins</i>	a collection of one net or multiple pins

ARGUMENTS

-net <i>net</i>	Connects new straps to the existing net that you specify. Use create_net if necessary.
-layers <i>hor_ver_list</i>	Specifies the horizontal and vertical layers to use for the mesh.
-num_straps <i>hor_ver_list</i> <i>pitches hor_ver_list</i>	Specifies the number of horizontal and vertical straps to be created. Both numbers should be positive integers. A mesh created with -num_straps {2 2} has an outer ring if only -ring is specified or a shape of a pound sign (#)

if **-ring** is not specified. High strap numbers result in a dense mesh. If you do not specify the **-pitches** or a **-num_straps** option, the command will synthesize a mesh based on internal experimental values.

-max_pitches *hor_ver_list*

Specifies the maximum horizontal and vertical pitches of the mesh. The first distance is the maximum vertical distance between horizontal straps, and the second is the horizontal distance between vertical straps. This option is mutually exclusive with **-num_straps**. This is a soft constraint; that is, if the pitch does not divide the effective bounding box evenly, additional straps will be added to allow the straps to be evenly distributed. You might want to use the electrical or physical limits as a base for the settings of this option.

-relative_pitches *hor_ver_list*

Specifies the relative horizontal and vertical pitches of the mesh. The pitches are represented as multiples of the default minimum wire spacing for the chosen layers. The first distance controls the minimum vertical distance between horizontal straps, and the second controls the horizontal distance between vertical straps. This option is mutually exclusive with **-num_straps**. This is a soft constraint; that is, if the pitch does not divide the effective bounding box evenly, additional straps will be added to allow the straps to be evenly distributed. You might want to use the electrical or physical limits as a base for the settings of this option.

-widths *hor_ver_list*

Specifies the widths of horizontal and vertical straps. If you do not specify this option, the command will select widths based on internal experimental values.

-relative_widths *hor_ver_list*

Specifies the widths of horizontal and vertical straps that are expressed as multiples of the default minimum wire width for the specified layers.

-keepouts *list_of_points*

Specifies a list of explicit locations of placement blockages or cells rather than design objects. The tool does not generate straps and vias that intersect these blocks.

-ring

Encloses the mesh with a rectangular ring that connects the ends of horizontal and vertical straps. This adds routing overhead, capacitance, and power, but the ring might be more effective for reducing impedance among drivers and loads near the perimeter of the mesh. Note that the ring cannot be completed if the mesh is blocked.

-bounding_box *rectangle*

Specifies the bounding box for the mesh. If both **-load** and **-bounding_box** are specified, the **-bounding_box** option takes precedence.

-lower_left *hor_ver_list*

Specifies the location of straps precisely. The specified list consists the X location of the leftmost vertical strap and the Y location of the lowest horizontal strap. Use this option to specify the point where the lowest horizontal strap crosses the leftmost vertical strap. The horizontal straps

will be limited on the left by the left edge of the (implied or specified) bounding box. Similarly, the vertical straps is limited on the bottom edge of the bounding_box.

-upper_right hor_ver_list

Specifies the point where the highest horizontal strap cross the rightmost vertical strap. This option can only be used with **-lower_left**. No vertical strap is allowed to the right of *ur_xloc*, and no horizontal strap is allowed above *ur_yloc*.

-max_displacement hor_ver_list

Sets the maximum allowed horizontal displacement of vertical straps and the maximum allowed vertical displacement of horizontal straps. Normally, the command places straps at the exact geometric location according to the specified options, but it will displace straps within the maximum allowable values to avoid obstructions. The default value of displacement is determined by internal experimental values, which can be overridden by **-max_displacement**. A large *max_hor* allows vertical straps to move great distances horizontally; a zero value eliminates any vertical straps that encounter a obstruction. See also the **-no_snap** option.

-load net_or_pins

If specified, use the bounding box of the specified pins as the bounding box for the mesh. If a net is present, then all pins on that net are considered.

-avoid instances

Specifies a collection of instances, typically large blocks. straps and vias that intersect these blocks will not be generated.

-no_snap

Specifies to turn the snap off. Normally, the command will adjust the position and spacing of the straps to coincide with the available routing tracks. If you do not want to do this, use the **-no_snap** option. The **-no_snap** option is useful early in the design process to help verify the **-bounding_box**, **-offset**, or other options. The option allows you to see where the straps are placed based on these options directly.

-check_only

Specifies not to actually insert the straps. Use the option to report the number of straps that would be created and their properties. If GUI is awake, it will display the tentative horizontal and vertical straps in the GUI after removing any previously annotated tentative straps.

-remove_display

Removes the tentative mesh straps previously annotated by the **-check_only** option in the GUI. It operates only if the GUI is awake.

-verbose

Specifies to generate messages during the process of creating straps. This option is off by default. Use **-verbose** if you want to see these messages.

-offset hor_ver_list

Moves the newly created vertical straps to the right by the specified horizontal value, and the vertical straps up by the specified vertical value. Use this option to line up with power and ground straps, but avoid

intersecting.

-full_pitch_perimeter

Adjusts spacing so that the four straps on the right, left, top, and bottom sides are away from the perimeter by a full pitch of a grid. The default is half a pitch.

-pitches

Specifies the horizontal and vertical pitches of the mesh. The first distance is the vertical distance between horizontal straps, and the second is the horizontal distance between vertical straps. This option is mutually exclusive with **-num_straps**. This is a hard constraint.

DESCRIPTION

This command builds a grid of horizontal and vertical straps suitable for a clock mesh. It is one of the first steps in clock mesh tree creation. Alternatively, you could create such a grid with a series of **create_net_shape** and **create_via** commands, but this **create_clock_mesh** command is specifically designed for the task.

The mesh will cover an rectangular area which may be specified directly with the **-bounding_box** option, or indirectly with the **-load** option. If **-load** is used, the mesh will be just big enough to cover all of the pins specified in the load. Typically, it is easiest just to specify the ideal clock net as the **-load** option. If neither **-bounding_box** nor **-load** is specified, the command will chose an area based on the site arrays in the current design.

The layers of the straps are specified as a list with the **-layers** option, with the first element in the list being the horizontal layer and the second being the layer to used for vertical straps. The widths may be omitted, in which case heuristic width straps are used. If **-widths** are used, the first element is the width for horizontal straps and the second for vertical straps. Alternatively, widths may be specified relative to the minimum width for the layer with the **-relative_widths** options.

Note that for the options that accept lists, the order of the elements in the list is important. E.g. when the first element in the **-layers** list is the horizontal layer (e.g. "M7"), it corresponds to the first element in the **-num_straps** options (e.g. 7): thus generating 7 horizontal straps on layer M7. If the second element in the **-layers** list is "M8" and the second element in the **-widths** option is 2.0, then straps on layer M8 will have a width of 2.0 microns.

The mesh will cover the entire rectangle defined by the bounding box unless **-avoid** or **-keepouts** is used to specify one or more blocks where the mesh should not be created. Use this option with care: it is possible to construct meshes with poor electrical connectivity, or even disconnected straps, using this option.

If you want a ring around the perimeter of your mesh, use the **-ring** option. A mesh created with the **-ring** option,

-ring -num_straps {2 2}

will look like a square. A mesh created without the **-ring** option,

```
-num_straps {2 2}
```

will look like a pound side ("#").

The number of straps can be any non-negative number, so

```
-num_straps {1 1}
```

will produce two straps shaped like a plus sign "+". And

```
-num_straps {8 0}
```

will add 8 horizontal straps and no vertical straps. Note that when 0 straps are specified in one dimension, the calculations are done internally as if two or more straps were specified in the other dimension, and then those straps are suppressed. This is important because the length of the horizontal straps, for example, is dependent on the vertical straps. For example, a command with

```
-num_straps {2 0}
```

will place two horizontal straps directly on top of the two horizontal straps created by

```
-num_straps {2 7}
```

This was done to facilitate producing complex meshes by running **create_clock_mesh** multiple times.

By default, the spacings between straps are equal in the interior of the mesh, but only half as wide around the perimeter. This is done so that each horizontal/vertical crossing is surrounded by the same area.

If you want evenly spaced straps, use the **-full_pitch_perimeter** option. For example, if a bounding box were {{0 0} {120.0 240.0}} and the options

```
-num_straps {2 4} -full_pitch_perimeter
```

were used to generate 2 horizontal straps and 4 vertical straps, the vertical straps would be 48 microns apart and 48 microns from the right and left sides. (240 divided by 5). Without the **-full_pitch_perimeter** option, the interior pitch would be adjusted to 60 microns, and the leftmost mesh strap is placed 30 microns (one half pitch) away from the bounding box, and the rightmost mesh strap would be 30 microns (one half pitch) away from the right side of the bounding box. Similar calculations would apply for the top and bottom straps. This style is preferred if you intend to place a driver at each interior intersection (in this case, 8 drivers), because then each driver is in the center of a rectangle with the same dimensions, and all drivers would serve similar loads.

If you know exactly where you want to place the wires, you may want to use the **-lower_left** and **-pitch** options. The argument to the **-lower_left** option is the exact position of the center of the crossing of the leftmost vertical wire with the bottommost horizontal wire. Using the **-pitch** option lets you specify the precise distance between wires. If you do this, you cannot specify the **-num_straps** option: the number of straps will be determined for you. But if you want fewer straps, you can limit the grid by specifying the **-upper_right** option. No vertical wires will be

added to the right of this point, nor any horizontal wires above this point.

Thus

```
create_clock_mesh -layer {M5 M6} -lower_left {15.125 76.015} -pitches {100 200}
```

would create vertical wires with X coordinates 15.125, 215.125, 415.125, etc and horizontal wires with Y coordinates of 76.015, 176.015, 276.015, etc.

A comment on the terminology used to define nets (relevant to all the clock mesh commands) :

The commands that deal with clock meshes distinguish among three types of important nets. The term "clock net" refers to a net normally associated with the original ideal clock. Typically it is connected to an input port, or it may be marked in SDC as a derived clock. Generally, a clock starts out as an ideal net connected to a port or a clock driver and many loads.

The "root net" is the net at the apex of the tree of buffers that drive the mesh. The "root net" is often the same net as the "clock net", but need not be. If several clocks are distributed by the same mesh, the root net will be a common point for their distribution, but the root net need not be uniquely associated with one clock.

The "mesh net" is the net of the wiring grid. In the methodology illustrated here, the mesh net is created using **create_net** before creating the mesh itself.

Because each of these nets is important in understanding and analyzing the circuit, it is advisable to assign them evocative names. If there is only one clock involved, perhaps called "clk" connected to a port called "clk", then the net associated with the mesh might be called "clk_mesh." and the root net is also net "clk." The **create_clock_mesh** command could use **-load** clk and **-net** clk_mesh. Later, the **add_clock_drivers** command would take the pins that are on the net called clk, disconnect them from net "clk" and connect them to net clk_mesh, and add drivers that start from the net clk and drive clk_mesh. If you chose to use the **analyze_subcircuit** command, it would model the circuit starting from net "clk" through all the pins connected to net "clk_mesh".

If there were two distinct clocks, "clk1" and "clk2" that are gated together into the root of the tree, the root might be called "clk1_clk2_root", and the mesh that is driven might be "clk1_clk2_mesh". The **create_clock_mesh** command could use **-load** clk1_clk2_root and **-net** clk1_clk2_mesh. Later, the **add_clock_drivers** command would take the pins that are on the net called clk1_clk2_root, disconnect them from clk1_clk2_root and connect them to net clk1_clk2_mesh, and add drivers that start from the net clk1_clk2_root and drive clk1_clk2_mesh. The **add_clock_drivers** command would not deal with the nets "clk1" or "clk2". The **analyze_subcircuit** command would model the circuit starting from net "clk1_clk2_root" through all the pins connected to net "clk1_clk2_mesh". The **analyze_subcircuit** command would not begin its analysis at net clk1 or clk2, because **analyze_subcircuit** requires a single net at its root.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example creates a grid with horizontal straps on M7 and vertical straps on M8. It will include the top and bottom straps that form a ring around the mesh, and it connects the load pins to the net of the mesh, which is called "clk1_mesh". The command will enter just enough horizontal straps so that the distance between them will not be more than 100 times the minimum pitch for layer M7. It will add just enough vertical straps so that the pitch between them will not be more than 150 times the minimum pitch for layer M8. Since the widths of the straps are not specified, the command will choose the widths according to its internal experimental values.

```
prompt> create_net clk1_mesh
1
prompt> set_attribute [get_net clk_mesh] net_type "Clock"
1
prompt> create_clock_mesh -net [get_net clk1_mesh] \
   -load [get_pins -of clk] -ring \
   -relative_pitches {100 150} -layers {M7 M8}
1
```

compile_clock_tree(2)
```

create_command_group

Creates a new command group.

SYNTAX

```
string create_command_group
group_name
```

Data Types

group_name string

ARGUMENTS

group_name
Specifies the name of the new group.

DESCRIPTION

The **create_command_group** command is used to create a new command group, which you can use to separate related user-defined procedures into functional units for the online help facility. When a procedure is created, it is placed in the "Procedures" command group. With the **define_proc_attributes** command, you can move the procedure into the group you created.

group_name can contain any characters, including spaces, as long as it is appropriately quoted. If *group_name* already exists, **create_command_group** quietly ignores the command. The result of **create_command_group** is always an empty string.

EXAMPLES

The following example demonstrates the use of the **create_command_group** command.

```
prompt> create_command_group {My Procedures}
prompt> proc plus {a b} {return [expr $a + $b]}
prompt> define_proc_attributes plus -command_group "My Procedures"
prompt> help
My Procedures:
    plus
...

```

SEE ALSO

define_proc_attributes(2)
help(2)

create_connview

Automatically invoke Hercules connectivity engine to generate connectivity (CONN) view and current source files (CSF) for nonstandard cells. The generated CONN view and CSF files can be used during IR drop analysis.

SYNTAX

```
status create_connview
-library library_name
-design design_name
[-power_nets net_names]
[-ground_nets net_names]
[-generate_csf]
[-skip_via mask_names]
[-connview_skip_cell cell_names]
[-csf_skip_cell cell_names]
[-layer_text mask_names_text]
```

Data Types

<i>library_name</i>	string
<i>design_name</i>	string
<i>net_names</i>	string
<i>mask_names</i>	string
<i>cell_names</i>	string
<i>mask_names_text</i>	string

ARGUMENTS

```
-library library_name
    Specify the name of the library. The library is the one in MilkyWay database.
    This is a required option. There is no default value for this option.

-design design_name
    Specify the single cell name in the specified Milkyway library for which you
    want to generate CONN view. This is a required option. There is no default
    value for this option.

-power_nets net_names
    Specify names of the top-level power nets to be extracted. At least one of
    the following options: -power_nets, or -ground_nets is needed.

-ground_nets net_names
    Specify names of the top-level ground nets to be extracted. At least one of
    the following options: -power_nets, or -ground_nets is needed.

-generate_csf
    Specify to generate current source files (CSF) and then attach to CONN view
    during CONN view generation. The files will be used during rail analysis
    functions such as ICC-DP PNA or PrimeRail/AstroRail to improve accuracy by
    placing current sinks of hard macros into the locations described in the CSF
    file. By default, the option is off, meaning not generating CSF files.
```

```

-skip_via mask_names
    Specify the mask names of vias for extracting the connectivity not through
    the specified vias. If the option is not specified, the command will extract
    connectivity through via1 to via11 (metal1 to metal12).

-connview_skip_cell cell_names
    Specify the child cells to be excluded from the CONN view generation. By
    default, all the child cells will be included.

-csf_skip_cell cell_names
    Specify the child cells to be excluded from the current source file
    generation. By default, all the child cells will be included.

-layer_text mask_names_text
    Specify metal mask names with name or number of the layers used for text
    identifying the corresponding metal layer geometries. If all text layers
    match the geometry layers, then the option is not needed. The format of the
    layer text is as follows.
    mask_name:layer_name_or_number
    For example,
    -layer_text {metal2:32 metal3:31}
    Use layer 32 to identify metal2 geometry, and layer 31 for metal3.

```

DESCRIPTION

Non-standard cells, such as hard macros, can have significant effects on voltage drop and electromigration at the full-chip level. The power consumption of these cells or the power and ground routing that exists inside these cells could allow voltage to flow through the cells to other regions of the chip. It is therefore necessary to be able to consider the internal power and ground network and power consumption of these types of cells during IR drop analysis. The command combines the values of the routing and the power usage into a single construct that rail analysis tools such as ICC-DP PNA or PrimeRail can access. The construct consists of the following two parts:

- Connectivity (CONN) view: The CONN view represents the power and ground networks inside the cell in question.
- Current source file (CSF): The CSF file is an ASCII file that records where current (and hence power) is drawn inside the cell.

This command automatically invoke Hercules connectivity engine to generate connectivity (CONN) view and current source files (CSF) for nonstandard cells.

Note: You should close the library and cell of interest before running this command. The number of cells printed in each Hercules command is limited to 300 to prevent the Hercules parser from breaking.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example shows how to generate a CONN view and CSF files with library ts1ge256x16m4.lib, cell view named TS1GE256X16M4, power net VDD and ground net VSS.

```
prompt> create_connview -library ts1ge256x16m4_lib -design TS1GE256X16M4 -  
power_nets VDD -ground_nets VSS -generate_csf
```

The following example shows how to generate a CONN view and CSF files with library ts1ge256x16m4_lib, cell view named TS1GE256X16M4, power net VDD, skip vias via2 and via3, skip cells S1B100W10_V4 and S1B100W10_V1_5 during CONN view generation, and use layer 5 as metall1 and layer 12 as metall2.

```
prompt> create_connview -library ts1ge256x16m4_lib -design TS1GE256X16M4 -  
power_nets VDD -skip_via {via2 via3} -  
connview_skip_cell {S1B100W10_V4 S1B100W10_V1_5} -layer_text {metall1:5 metall2:12}
```

[-extend_last bool]
[-snap_to_track bool]
[-look_inside_std_cell bool]
[-reverse_net_order bool]
[-draw_bbox_vias bool]
[-show_detailed_info bool]
[-honor_route_guides bool]
[-extend_first_to_boundaries bool]
[-extend_last_to_boundaries bool]
```

Data Types

<i>collection_of_nets</i>	collection
<i>mark_type</i>	string
<i>start_type</i>	string
<i>list_of_layers_with_options</i>	list
<i>layer</i>	string
<i>file_name</i>	string
<i>distance</i>	distance

ARGUMENTS

```
-start_command
    Start the mouse interaction mode.

-add_point point
    Adds mouse point to process
```

```

-delete_point
    Delete the last point

-end_points
    Commits point input. Undo operation becomes possible after it.

-end_command
    Ends the command

-undo
    Removes last committed wires and vias.

-nets collection_of_nets
    collection of nets. Maximum nets allowed is 2

-horizontal_layer layer
    Metal layer number or layer name to be given. Default is the first listed
    horizontal metal layer from tech file.

-horizontal_width distance
    Width of the given metal layer from the tech file

-horizontal_pitch distance
    Pitch of the given metal layer from the tech file

-vertical_layer layer
    Metal layer number or layer name to be given. Default is the first listed
    vertical metal layer from tech file.

-vertical_width distance
    Width of the given metal layer from the tech file

-vertical_pitch distance
    Pitch of the given metal layer from the tech file

-mark_as mark_type
    Mark created wires and vias as one of: strap ring (default)

-set_of_layers list_of_layers_with_options
    The list of layers with options in the following format: {<layer>
    <horizontal|vertical> <width> <bool> list} It specifies the set of layers to
    create wires on. The parameter is a list of layer, horizontal or vertical
    flags, boolean flags, which tell to search targets on specified layer. The
    <layer> can be specified either with the layerNumber or maskName from the
    technology file.

-override file_name
    It is used to over-ride the width and/or pitch specs specified by other
    options. An over-ride should be specified on one single line and has either
    one of the following formats: net_number width pitch (net_number1 netnumber2
    ...) width pitch.

-start_at start_type
    When creating wire start at the low or high end of the net. One of: low_end
    (default) high_end

```

```

-switch_end_at_turning bool
    When turning switch ends. It's false by default.

-skip_count int
    Specifies number of nets are skipped during the change of the direction

-multi_via_count int
    Specifies the minimum number of via cuts. It's 1 by default.

-extend_first bool
    Extend the wire from the first point entered. It's false by default.

-extend_last bool
    Extent the last bit of bus. It's false by default.

-snap_to_track bool
    Create wire on wire track. It's false by default.

-look_inside_std_cell bool
    Create vias to connect wires to pins inside std cells. It's false by default.

-reverse_net_order bool
    Reverse the order of the bit of bus. It's false by default.

-draw_bbox_vias bool
    Draws only the bounding box of the via. It's true by default.

-show_detailed_info bool
    Shows widths and increasing length number, dynamically for each nets. It's
    false by default.

-honor_route_guides bool
    Consider variable route rule defined for the nets. It's false by default.

-extend_first_to_boundaries bool
    Extend the first created wire and generate a pin at boundary. It's false by
    default.

-extend_last_to_boundaries bool
    Extend the last created wire and generate a pin at boundary. It's false by
    default.

```

DESCRIPTION

Creates wires between specified points. Because it's interactive command, it requires GUI to be started with `gui_start` command. You can change the internal application of DRC rules by using the `set_preroute_drc_strategy` command.

NOTES

You can use the undo operation to remove segments with `create_custom_wire -undo`.

EXAMPLES

The following example creates a custom wire shape and then destroys it with undo.

```
prompt> gui_start
prompt> create_custom_wire -start_command
prompt> set_preroute_drc_strategy -drc_off -min_layer METAL -max_layer METAL5
prompt> create_custom_wire -add_point {100.00 100.100}
prompt> create_custom_wire -add_point {200.00 100.100}
prompt> create_custom_wire -end_points
prompt> create_custom_wire -undo
prompt> create_custom_wire -end_command
```

SEE ALSO

[set_preroute_drc_strategy\(2\)](#)
[gui_start\(2\)](#)

create_differential_group

Defines a differential group for nets.

SYNTAX

```
status create_differential_group
-group group_name
-nets {collection_of_nets}
```

Data Types

<i>group_name</i>	string
<i>collection_of_nets</i>	list

ARGUMENTS

```
-group group_name
      Enter the name of the differential group of cells that are being defined.

-nets {collection_of_nets}
      Enter the name(s) of the net(s) you want to define associated to a specified
      differential group
```

DESCRIPTION

Defines your differential groups, one group at a time. Each group can have two or more nets. After you define the differential groups, you can route them by using the route_differential command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example is to setup a differential group, "dgroup", associated to the net(s) with prefix of "net_diff".

```
prompt> create_differential_group -group dgroup -nets \
[get_nets net_diff*]
```

SEE ALSO

route_differential(2)

create_drc_error

Creates an error record.

SYNTAX

```
collection create_drc_error
-type error_type
[-status error_status]
[-info description]
[-error_view mw_error_view]
[-details details]
```

Data Types

<i>error_type</i>	string
<i>error_status</i>	string
<i>description</i>	string
<i>mw_error_view</i>	list or collection

ARGUMENTS

```
-type error_type
      An error type id or name of the new error object. This argument is required.

-status error_status
      The current status of this error. Must be one of {Error, Fixed, Ignored, Waived}. If omitted, it is set to "Error."

-info description
      A full description of this error. If omitted, left empty.

-error_view mw_error_view
      The error view in which to create the error record. If omitted, the error record will be created in the current toplevel design cell. Specifying more than one error view causes an error.

-details details
      The details of the error including shapes, nets, and layers. This argument is optional. However, an error with no details is virtually useless. Details may be added using the command add_drc_error_detail. Components of details shape If -details argument is given, shapes are required describing rectangles to add to the error with optional associated layer.
```

DESCRIPTION

This command creates a new error object of the given type. Every error object must be associated with one and only one error type. The error type association is made when the error object is created and is immutable. Therefore, error types must be first created before error objects of that type can be created.

The command returns a collection with the new error object if successful. An error

type is associated with a type class when it is created. Error objects of a type in a type class receive data interpretation that is specific to that type class. Non-default type classes are: Open, Open Locator, Short, and Spacing. This command is appropriate for creating an error object for a type in the Default type class, with default data interpretation. There are error object creation commands specific to the non-default classes which ensure errors that are correct by construction.

EXAMPLES

The following example opens an error view named "mydesign_idrc.err" and creates an error type named "Overlap", then creates an error record of the type:

```
prompt> set cellId [open_mw_cel -not_as_current mydesign_idrc.err]
{mydesign_idrc}
prompt> set typeId [create_drc_error_type -name Overlap \
    -info "Metal and blockage overlap" -error_view $cellId
1024
prompt> create_drc_error -type $typeId -error_view $cellId \
    -details {1 {1 {{layer RV} 1 {574.0700 430.3600 578.9700 433.4400}}}}
{1280}
```

create_drc_error_type

Creates an error type record. Each error object must be associated with one and only one error type record.

SYNTAX

```
integer create_drc_error_type
-name type_name
[-class type_class]
[-info description]
[-status error_status]
[-level err_type_level]
[-error_view mw_error_view]
```

Data Types

<i>type_name</i>	string
<i>type_class</i>	string
<i>description</i>	string
<i>error_status</i>	string
<i>err_type_level</i>	string
<i>mw_error_view</i>	list or collection

ARGUMENTS

-name *type_name*

Specify a required brief name or label to identify this error type. The given name must be unique in a case-insensitive comparison with existing names. The command fails if a type with the given name already exists.

-class *type_class*

One of the type classes {Default, Open, OpenLocator, Short, Spacing}. Type class name keywords are case insensitive. If given, error objects of this type will receive data interpretation specific to the type class. If omitted, or if "Default" is given, error objects of this type will receive the default data interpretation.

-info *description*

A full description of this error type. If omitted, it is left empty.

-status *error_status*

Sets the default status for errors of this error type. Must be one of {Error, Fixed, Ignored, Waived}. If omitted, it is set to "error."

-level *err_type_level*

The severity level of this error. Must be one of {"Error", "Critical Error", "Major Error", "Moderate Error", "Minor Error", "Recommendation"}. If omitted, it is set to "Error."

-error_view *mw_error_view*

The error view in which to create the error type record. If omitted, the error type record will be created in the current toplevel design cell. Specifying

more than one error view causes an error.

DESCRIPTION

This command creates a new error type with the given type name. Every error object must be associated with one and only one error type. The error type association is made when the error object is created and is immutable. Therefore, an error type must be first created before error objects of that type can be created.

The command returns the data object ID of the new error type record if successful, 0 otherwise. The returned ID for the error type record can be used to identify the type in "-type" arguments for creating error objects for the type. Alternatively, the type name given as the argument to the -name option can be used to identify the type if it unambiguously identifies a type record.

The IC Compiler Error Browser allows the user to display error objects grouped by type. Error objects can also be sorted or filtered by type. Error types can be declared to be in a type class. Error objects of a type in a type class receive data interpretation that is specific to that type class. Non-default type classes are: Open, OpenLocator, Short, and Spacing. To create an error type in a non-default type class, use the -class argument. The error type association with a type class is made when the error type is created and is immutable.

EXAMPLES

The following example opens an error view named "mydesign_idrc.err" and creates an error type named "Overlap" in the default type class:

```
prompt> set cellId [open_mw_cel -not_as_current mydesign_idrc.err]
{mydesign_idrc}
prompt> create_drc_error_type -name Overlap -info "Metal and blockage overlap" \
-error_view $cellId
1024
```

The following example adds a type named "Via Spacing" which is in the "Spacing" type class to an error view named "mydesign_lcc.err"

```
prompt> create_drc_error_type -name "Via Spacing" -class "Spacing" \
-error_view "mydesign_lcc.err" \
-info "Via corner spacing" -error_view $cellId
1025
```

create_edit_group

SYNTAX

```
collection create_edit_group
[-name group_name]
objects
```

Data Types

<i>group_name</i>	string
<i>objects</i>	collection

ARGUMENTS

-name *group_name*
Specifies the name of the edit group. The name must be unique if specified. If it is not specified, the tool generates an unique name for the group.

objects
Specifies the collection of objects to be placed in the edit group. Objects are limited to those which are movable and do not already belong to another edit groups. If any specified object is invalid, no edit group is created.

DESCRIPTION

Creates a new edit group from the specified objects. If the command is executed successfully, the tool will return a collection of object in the group.

EXAMPLES

The following example shows the creation of an edit group with the objects in the current selection.

```
> set gr [create_edit_group [get_selection]]
```

SEE ALSO

`get_edit_groups(2)`
`remove_edit_groups(2)`
`report_edit_groups(2)`

create_fp_block_shielding

Creates signal shielding for plan groups and soft macros.

SYNTAX

```
status create_fp_block_shielding
[-inside_boundary]
[-outside_boundary]
[-side_list {left | right | top | bottom}]
[-metal_layers layer_list]
[-shielding_width factor_or_distance]
[-width_in_microns]
[-tie_to_net net]
[-block_level]
[objects]
```

Data Types

<i>layer_list</i>	collection
<i>factor_or_distance</i>	float
<i>net</i>	collection of one
<i>objects</i>	collection

ARGUMENTS

-inside_boundary

Creates shielding on the inside of plan group(s) and/or soft macro(s). If you do not specify the **-inside_boundary** and **-outside_boundary** options, the command creates shielding on both the interior and exterior sides of the plan group(s) and/or soft macro(s). By default, this option is off (false).

-outside_boundary

Creates shielding on the outside of the plan group(s) and/or soft macro(s). If you do not specify the **-inside_boundary** and **-outside_boundary** options, the command creates shielding on both the interior and exterior sides of the plan group(s) and/or soft macro(s). By default, this option is off (false).

-side_list {left | right | top | bottom}

Indicates the side(s) on which to create shielding rectangles. By default, the command creates shielding on all sides of the plan group(s) and/or soft macro(s).

-metal_layers layer_list

Specifies a layer object collection indicating the metal layer(s) on which to create shielding. By default, the command determines the appropriate layers for shielding on each side. See the explanation in DESCRIPTION for detailed information on automatic layer selection by the command.

-shielding_width factor_or_distance

Specifies the factor or distance by which the shielding width is multiplied. The shielding width is determined by a metal layer's pitch, unless you use the **-width_in_microns** option, in which case the command interprets the the

value of *factor_or_distance* as an absolute distance in microns. By default, the *factor_or_distance* value is **3.0**.

-width_in_microns
Interprets the value of the **-shielding_width** option as an absolute distance value in micron units. By default, this option is off (false).

-tie_to_net net
All shielding rectangles are tied logically to the single net represented by the net collection. This must be a single net (VSS, VSS1, GND, VDD, etc...) in the collection (i.e. what would be returned by [get_nets -all {VSS}]). By default, all shielding rectangles are logically floating.

-block_level
This option is for creating block shielding from the inside of a soft macro cell opened for edit. This will only create shielding around the inside of the cell boundary outline. No shielding will be created outside of the cell boundary outline. The options *-inside_boundary* and *-outside_boundary* are meaningless and disregarded in the context of the use of this option. Also, the *object_list* object collection is meaningless and disregarded when this option is specified. All other options may be used in combination with this option. By default, this option is off (false).

objects
Specifies a collection of plan group(s) and/or soft macro(s) on which to apply route blockages for signal integrity shielding. By default, the command processes all plan groups and soft macros.

DESCRIPTION

This command creates signal shielding for plan groups and soft macros. The shielding is used to maintain signal integrity when routing a design. Shielding takes the form of metal rectangles around the boundary of a block. These rectangles are regular route metal rectangles, subject to all metal layer rules. When shielding would block access to pins along a side edge on the same layer as the shielding, the shielding is segmented to allow access to the pins. You can specify a list of plan groups/soft macros for the command to process. By default, it processes all plan groups/soft macros.

The command can create shielding on the inside and/or outside of a plan group/soft macro. When the command creates inside shielding for soft macros, it is created at the child level. The command accepts a list of sides indicating on where to create shielding. By default, the command creates shielding on all sides, based on the rules provided below.

You can specify the metal layers on which to create shielding. By default, the command creates shielding on each metal layer and uses each layer's preferred direction to determine on which sides to create the shielding. For example, if metal 2's preferred direction is horizontal, the command creates metal 2 blockage rectangle blockages on the top and bottom sides of the plan group/soft macro. The argument to this option is a collection of layer objects returned by the **get_layer command** (for example, **[get_layer {metal1 metal2}]**).

You can specify the width of the shielding to the command. By default, the command

uses a width of 3 times the route pitch for each respective metal layer. The pitch is multiplied by the multiplier that you specify by using the **-shielding_width** option or by the default multiplier of 3. You can flag the command to use an absolute width of microns instead of the multiplier by specifying the **-width_in_microns** option.

The rectangles the command creates are marked in the database, so that they can be recognized for deletion by the **remove_fp_block_shielding** command.

If it is desired for the shielding rectangles to be tied to a particular power or ground net, then the **-tie_to_net** option may be used to specify which power or ground net to use. This option may be used by passing a single net name or a net collection of 1, such as may be returned by the [get_nets -all {VSS}] command. This functionality only logically ties the rectangles to a particular power or ground net. It is beyond the scope of this option to physically connect to power or ground.

If it is desired to create shielding from inside of a soft macro opened in IC Compiler for edit, then the **-block_level** option may be called to create block shielding around the inside of the opened-for-edit soft macro's inside cell outline boundary.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates metal route blockages (shielding) on the top and left interior sides on metal layers 2, 6, and 7.

```
prompt> create_fp_block_shielding inside_boundary \
-side_list {top left} \
-metal_layers [get_layer {metal2 metal6 metal7}]
```

The following example creates exterior metal route blockages (shielding) of width 5 microns on the specified list of soft macro and plan groups. This example allows the command to determine on which metal layers and sides to create shielding.

```
prompt> create_fp_block_shielding -outside_boundary \
-shielding_width 5.0 -width_in_microns [get_cells \
{macro1 macro2 plan_group2 plan_group_8}]
```

This example creates shielding rectangles on inside and outside boundaries of all plan groups and soft macros and assigns them to the ground net VSS. This example allows the command to determine on which metal layers and sides to create shielding.

```
prompt> create_fp_block_shielding outside_boundary \
-tie_to_net [get_nets -all {VSS}]
```

This example creates shielding rectangles on the inside of the cell boundary outline

of the cell that is opened for edit. This example allows the command to determine on which metal layers and sides to create shielding.

```
prompt> create_fp_block_shielding-block_level
```

SEE ALSO

`remove_fp_block_shielding(2)`

create_fp_blockages_for_child_hardmacro

Creates routing blockages for hard macros within soft macros.

SYNTAX

```
status create_fp_blockages_for_child_hardmacro
list_of_softmacros
```

Data Types

list_of_softmacros collection

ARGUMENTS

list_of_softmacros

This is a collection of the soft macros which will be processed. If not supplied all soft macros will be processed.

DESCRIPTION

For each soft macro processed each hard macro within that soft macro will have a placement blockage created in the top level. This placement blockage will have the same boundary as the hard macro.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

Create placement blockages for hard macros in all soft macros.

```
create_fp_blockages_for_child_hardmacro
```

create_fp_group_block_ring

Creates a block ring for a group of hard macro blocks.

SYNTAX

```
status create_fp_group_block_ring
-nets nets
[-horizontal_ring_layer layer]
[-horizontal_ring_offset offset]
[-horizontal_ring_spacing spacing]
[-horizontal_ring_width width]
[-vertical_ring_layer layer]
[-vertical_ring_offset offset]
[-vertical_ring_spacing spacing]
[-vertical_ring_width width]
[-horizontal_strap_width width]
[-horizontal_strap_layer layer]
[-vertical_strap_width width]
[-vertical_strap_layer layer]
[-output_directory directory]
[-skip_strap]
```

Data Types

<i>nets</i>	collection of list
<i>layer</i>	string
<i>offset</i>	float
<i>spacing</i>	float
<i>width</i>	float
<i>directory</i>	string

ARGUMENTS

-nets *nets*
Specify the power or ground nets to perform group block ring creation. This is a required option.

-horizontal_ring_layer *layer*
Specify the horizontal ring layer, where the default is the top-most horizontal layer.

-horizontal_ring_offset *offset*
Specify the horizontal ring offset in microns, where the offset is measured from the block boundary but not from the PNS region. The default is the minimum spacing between hard macro blocks and the ring defined in the technology file.

-horizontal_ring_spacing *spacing*
Specify the horizontal ring spacing in microns between power and ground nets. The default is minimum spacing defined in the technology file.

```

-horizontal_ring_width width
    Specify the horizontal ring width in microns. The default is the minimum width
    defined in the technology file.

-vertical_ring_layer layer
    Specify the vertical ring layer, where the default is the top-most vertical
    layer.

-vertical_ring_offset offset
    Specify the vertical ring offset in microns, where the offset is measured
    from the block boundary but not from the PNS region. The default is the
    minimum spacing between hard macro blocks and the ring defined in the
    technology file.

-vertical_ring_spacing spacing
    Specify the vertical ring spacing in microns between power and ground nets.
    The default is minimum spacing defined in the technology file.

-vertical_ring_width width
    Specify the vertical ring width in microns. The default is the minimum width
    defined in the technology file.

-horizontal_strap_width width
    Specify the horizontal strap width, where the default is the minimum width
    defined in the technology file. The straps are inserted inside the narrow
    regions between neighboring macro blocks.

-horizontal_strap_layer layer
    Specify the horizontal strap layer, where the default is the top-most
    horizontal layer.

-vertical_strap_width width
    Specify the vertical strap width, where the default is the minimum width
    defined in the technology file. The straps are inserted inside the narrow
    regions between neighboring macro blocks.

-vertical_strap_layer layer
    Specify the vertical strap layer, where the default is the top-most vertical
    layer.

-output_directory directory
    Specify the directory in which to store the group block ring creation results.
    The default is ./pna_output.

-skip_strap
    Specify not to insert straps between hard macro blocks; only rings are created
    around the group of macro blocks.

```

DESCRIPTION

This command creates power and ground rings around a set of hard macro blocks with either rectangular or rectilinear boundaries. Straps are also inserted between neighboring blocks unless the **-skip_strap** option is specified.

A PNS region must first be created by using the **set_fp_rail_region_constraints** command. This PNS region provides a guideline for the group block ring contour. For example, a rectilinear region is needed as a guideline if a rectilinear ring is desired for a group of hard macro blocks. The specified PNS region is first shrunk based on all hard macro blocks inside this region to obtain the group block boundary while maintaining the region topology. Next, a ring is created around the group block boundary.

Channels between neighboring blocks are identified for strap insertion. The straps are inserted in the middle of each channel unless it is too narrow.

Sandwich-type rings (multiple rings in one layer) are supported by specifying multiple nets, for example **-net {VDD VDD VSS}**. Straps in channels are still created as a pair of power and ground straps in this case.

You can preview the group block ring result before actually committing the group block ring by using the **commit_fp_group_block_ring** command.

Remove the PNS region constraint after group block ring creation and before power network synthesis.

EXAMPLES

The following example shows how to create power (VDD) ground (VSS) group block ring for those hard macro blocks inside the predefined PNS region. The rings are created on horizontal layer METAL5 with a ring width of 1.0 micron and an offset of 0.6 micron and on vertical layer METAL6 with a ring width of 1.0 micron and an offset of 0.6 microns. The spacing between horizontal (or vertical) power and ground rings is 0.5 micron. The straps between neighboring blocks are created on horizontal layer METAL3 with a strap width of 0.5 micron and on vertical layer METAL4 with a strap width of 0.5 micron.

```
prompt> create_fp_group_block_ring
-nets {VDD VSS}
-horizontal_ring_layer METAL5
-horizontal_ring_offset 0.6
-horizontal_ring_spacing 0.5
-horizontal_ring_width 1.0
-vertical_ring_layer METAL6
-vertical_ring_offset 0.6
-vertical_ring_spacing 0.5
-vertical_ring_width 1.0
-horizontal_strap_width 0.5
-horizontal_strap_layer METAL3
-vertical_strap_width 0.5
-vertical_strap_layer METAL4
```

create_fp_pins

Creates pins for the specified list of child ports.

SYNTAX

```
pins create_fp_pins
[-side side_num_or_name]
-layer layer
[-width width]
[-step step_num]
{-at location | -offset offset}
child_ports
```

Data Types

<i>side_num_or_name</i>	string
<i>layer</i>	layer
<i>width</i>	real
<i>step_num</i>	integer
<i>location</i>	point
<i>child_ports</i>	collection

ARGUMENTS

```
-side side_num_or_name
      Specifies a side number or name. If -side is not provided, the argument -at must be used and off-edge pins will be created at/or around the location specified by -at.
```

```
-layer layer
      Specifies the layer name for a pin to be created.
```

```
-width width
      Specifies the pin width of a pin to be created.
```

```
-step step_num
      Specifies a wire track step for multiple pins to be created. The default is 1.
```

```
-at location
      Specifies location of the first pin to be created. For multiple off-edge pin creation, the first pin is located at the wiretrack intersection closest to the -at location, other pins are clockwise distributed around the first pin. The -at and -offset options are mutually exclusive; use only one.
```

```
-offset offset
      Specifies the offset from the start of a side. The -at and -offset options are mutually exclusive; use only one.
```

```
child_ports
      Specifies child ports for which to create pins. It is a collection of pins.
```

DESCRIPTION

This command creates pins for the specified list of child ports. Snapping is done automatically using global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example create pins for all child ports of a soft macro named *u2_large* on a layer named *M1*.

```
prompt> set pins [get_pins -of [get_cell u2_large]]  
prompt> set layer [get_layer M1]  
prompt> create_fp_pins -side 1 -layer $layer -offset 10 $pins
```

SEE ALSO

`get_nets(2)`
`get_pins(2)`

create_fp_placement

Places hard macros and leaf cells.

SYNTAX

```
int create_fp_placement
[-effort low | high]
[-max_fanout positive_integer]
[-no_hierarchy_gravity]
[-no_legalize]
[-incremental placement_string]
[-congestion_driven]
[-timing_driven]
[-num_cpus number_of_cpus]
[-plan_groups collection_of_plan_groups]
[-voltage_areas collection_of_voltage_areas]
[-optimize_pins]
[-ignore_scan]
[-write_placement_blockages]
```

Data Types

<i>positive_integer</i>	integer
<i>placement_string</i>	string
<i>number_of_cpus</i>	integer
<i>collection_of_plan_groups</i>	collection
<i>collection_of_voltage_areas</i>	collection

ARGUMENTS

-effort low | high

Provides a trade-off between quality of results (QoR) and the amount of CPU runtime spent performing a flat placement. The valid values are **low** and **high**. For fast results that provide good, nonoverlapping hard macro locations, set the effort to **low**. For higher quality placement, but with an increase in CPU runtime, set the effort to **High**. The default value is **low**.

-max_fanout *positive_integer*

Specifies that placement ignore nets having a fanout higher than the specified number specified by *positive_integer*. In other words, the wire length of these nets are not considered in placement. The default value is **512**.

-no_hierarchy_gravity

Prevents the grouping together of cells of the same hierarchy block. The default is to group cells of the same hierarchy block together. In general, this type of grouping results in better placement because designs tend to partition well along the hierarchy boundaries. However, this option should be used if the designer knows that the hierarchy is not a good partitioning of the design.

-no_legalize
Creates a placement that is not legalized. The default is to legalize it.

-incremental *placement_string*
Performs incremental placement from current placement. The valid values are **all**, **top_level_cells**, **plan_groups**, and **voltage_areas**. Use **all** to perform an incremental placement on the entire design. Use **top_level_cells** to run an incremental placement on top level cells that do not belong to any plan group or voltage area. Use **plan_groups** together with the **-plan_groups** option to perform incremental placement to the cells within the specified plan groups. Use **voltage_areas** together with the **-voltage_areas** option to perform incremental placement to cells within the specified voltage areas. The default is for the command to run placement from scratch.

-congestion_driven
Enables congestion-driven placement mode. By default, the command runs with congestion-driven placement mode off.

-timing_driven
Enables timing-driven placement mode. By default, the command runs with timing-driven placement mode off.

-num_cpus *number_of_cpus*
Specifies the number of CPUs used in parallel during coarse placement. The *number_of_cpus* is an integer value that is less than or equal to the number of free CPUs on your machine and greater than or equal to 1. By default, the command uses 1 CPU. Only one Galaxy-PSYN License is checked out.

-plan_groups *collection_of_plan_groups*
Performs refine placement for the specified plan groups. This option is valid only for plan groups placed inside the core area and when you specify the **-incremental plan_groups** option.

-voltage_areas *collection_of_voltage_areas*
Performs refine placement for the specified voltage areas. This option is valid only for voltage areas placed inside the core area and when you specify the **-incremental voltage_areas** option.

-optimize_pins
Does simultaneous placement and pin assignment for block level designs. The pin assignment done here only supports pin physical constraints such as side, location and order.

-ignore_scan
Ignores scan chain connections during placement.

-write_placement_blockages
All blockages computed internally during placement will be written to a file called `design_planning_blockages.tcl` in the working directory. This includes blockages due to channels that are narrower than the sliver size and macro padding blockages. If the `design_planning_blockages.tcl` file already exists in the working directory, it will be overwritten.

DESCRIPTION

This command performs a virtual flat placement to obtain a placement of standard cells and hard macros. It provides you with an initial placement for creating a floorplan to determine the relative locations and shapes of the top-level physical blocks of a flat design with no placed plan groups or voltage areas. For designs with plan groups and/or voltage areas placed, it provides you with a refined placement that honors the exclusiveness of plan groups and/or voltage areas.

When you use the **-optimize_pins** option, this command results in an virtual flat placement result as described above and also give a pin assignment respecting the pin constraints. In this mode, the placer understands TDF pin constraints such as side constraints; and thus, the overall quality of placement and pin assignment is better than separately running placement and pin assignment. Use this option at the block level, not at the chip level. It does not work with I/O pads.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example shows running a congestion driven placement.

```
prompt> create_fp_placement -congestion_driven
```

SEE ALSO

create_fp_plan_group_padding

Creates padding for the specified plan groups.

SYNTAX

```
status create_fp_plan_group_padding
[-internal_widths {left right top bottom}]
[-external_widths {left right top bottom}]
[plan_groups]
```

Data Types

<i>left</i>	float
<i>right</i>	float
<i>top</i>	float
<i>bottom</i>	float
<i>plan_groups</i>	collection or list

ARGUMENTS

-internal_widths {left right top bottom}
Specifies the explicit per-side widths of the internal paddings in microns.
You can use this option if you want to specify non-uniform internal padding widths. Specify all 4 sides in the indicated sequence. By default, this option is {1 1 1 1}.

-external_widths {left right top bottom}
Specifies the explicit per-side widths of the external paddings in microns.
You can use this option if you want to specify non-uniform external padding widths. Specify all 4 sides in the indicated sequence. By default, this option is {0 0 0 0}.

plan_groups
Applies padding to the specified plan groups. By default, the tool applies padding to all plan groups in the current design.

DESCRIPTION

This command performs plan group padding, which sets placement blockages on the internal and external edges of the boundary. The internal padding is equivalent to the core-to-boundary spacing of the committed block. External padding is equivalent to macro padding. Internal padding should be set to at least 1 on all blocks to allow room for pins and pin routing. You can use the **-internal_widths** and **-external_widths** options to create non-uniform padding widths on a per-side basis. All values are in microns.

To remove plan group padding, use the **remove_fp_plan_group_padding** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates internal plan group padding on a per-side basis:

```
prompt> create_fp_plan_group_padding\
-internal_widths {2 3 4 5}\
-external_widths {6 7 8 9}
```

SEE ALSO

[remove_fp_plan_group_padding\(2\)](#)

create_fp_virtual_pad

Creates virtual power or ground pads for power network analysis and power network synthesis.

SYNTAX

```
status create_fp_virtual_pad
[-nets string]
[-layer string]
[-point {x y}]
[-load_file string]
[-save_file string]
```

ARGUMENTS

-nets *string*
Specify the name(s) of the power or ground nets that you want power network analysis performed on. You can specify only one net at a time.

-layer *string*
Specify the layer name of a pad that you want to create.

-point {*x* *y*}
Specify a virtual pad point {*x* *y*} that you want to place. The value, *x* or *y* is float number. Unit in {*x* *y*} point is micron.

-load_file *string*
Specify the file name with virtual power pads pads.

-save_file *string*
Specify the file name to save virtual power pads.

DESCRIPTION

Creates virtual power or ground pads based on net nad, or load the virtual pads from the specified file, or save the virtual pads into the specified file

create_generated_clock

Creates a generated clock object.

SYNTAX

```
string create_generated_clock
[-name clock_name]
[-add]
source_objects
-source master_pin
[-master_clock clock]
[-divide_by divide_factor
 | -multiply_by multiply_factor]
[-duty_cycle percent]
[-invert]
[-preinvert]
[-edges edge_list]
[-edge_shift edge_shift_list]
[-combinational]
```

Data Types

<i>clock_name</i>	string
<i>source_objects</i>	list
<i>master_pin</i>	list
<i>clock</i>	string
<i>divide_factor</i>	integer
<i>multiply_factor</i>	integer
<i>percent</i>	float
<i>edge_list</i>	list
<i>edge_shift_list</i>	list

ARGUMENTS

-name *clock_name*

Specifies the name of the generated clock. If you do not use this option, the clock receives the same name as the first clock source specified in the **-source** option. If you specify the **-add** option, you must use the **-name** option and the clocks with the same source must have different names.

-add

Specifies whether to add this clock to the existing clock or to overwrite. Use this option to capture the case where multiple generated clocks must be specified on the same source, because multiple clocks fan into the master pin. Ideally, one generated clock must be specified for each clock that fans into the master pin. If you specify this option, you must also use the **-name** option.

Defining multiple clocks on the same source pin or port causes longer runtime and higher memory usage than a single clock, because the synthesis timing engine explores all possible combinations of launch and capture clocks. Use the **set_false_path** command to disable unwanted clock combinations. This option is ignored by default, unless multiple clocks analysis is enabled by

setting the **timing_enable_multiple_clocks_per_reg** variable to **true**.

source_objects
Specifies a list of ports or pins defined as generated clock source objects.

-source master_pin
Specifies the master clock pin, which is either a master clock source pin or a pin in the fanout of the master clock and driving the generated clock definition pin. The clock waveform at the master pin is used for deriving the generated clock waveform.

-master_clock clock
Specifies the master clock to be used for this generated clock if multiple clocks fan into the master pin.

-divide_by divide_factor
Specifies the frequency division factor. If the *divide_factor* is 2, the generated clock period is twice as long as the master clock period.

-multiply_by multiply_factor
Specifies the frequency multiplication factor. If the *multiply_factor* is 3, the period is one third as long as the master clock period.

-duty_cycle percent
Specifies the duty cycle (in percent), if frequency multiplication is used. This is a number between 0 and 100. The duty cycle is the high pulse width.

-invert
Inverts the generated clock signal no matter the sense of the source clock on master pin is unate or non-unate (in case of frequency multiplication and division).

-preinvert
Creates a generated clock based on the inverted clock signal only when the source clock on master pin has a non-unate sense, or the generated clock will not be inverted just as this option has not been specified. The difference between the **-invert** option and the **-preinvert** option is that the **-invert** option first creates the generated clock, then inverts the signal, and the **-preinvert** option first inverts the signal, and then creates the generated clock signal.

-edges edge_list
Specifies a list of positive integers that represents the edges from the source clock that are to form the edges of the generated clock. The edges are interpreted as alternating rising and falling edges and each edge must be not less than its previous edge. The number of edges must be an odd number and not less than 3 to make one full clock cycle of the generated clock waveform. The first edge must be greater than or equal to 1. For example, 1 represents the first source edge, 2 represents the second source edge, and so on.

-edge_shift edge_shift_list
Specifies a list of floating point numbers that represents the amount of shift, in library time units, that the specified edges are to undergo to yield the final generated clock waveform. The number of edge shifts specified must be equal to the number of edges specified. For example, 1 indicates that the

corresponding edge is to be shifted by 1 library time unit.

-combinational

Specifies that the source latency paths for this type of generated clock only includes the logic where the master clock propagates along combinational paths. The source latency paths will not flow through sequential element clock pins, transparent latch data pins, or the source pins of other generated clocks.

DESCRIPTION

The **create_generated_clock** command creates a generated clock object in the current design. This command defines a list of objects as generated clock sources in the current design. You can specify a pin or a port as a generated clock object. The command also specifies the clock source from which it is generated. The advantage of using this command is that whenever the master clock changes, the generated clock changes automatically.

The generated clock can be created as a frequency divided clock with the **-divide_by** option, a frequency multiplied clock with **-multiply_by**, or an edge derived clock with **-edges**. In addition, the frequency divided or multiplied clock can be inverted with the **-invert** option. The shifting of edges of the edge-derived clock is specified with the **-edge_shift** option. The **-edge_shift** option is used for intentional edge shifts and not for clock latency. If a generated clock is specified with a *divide_factor* that is a power of 2 (1, 2, 4, ...), the rising edges of the master clock are used to determine the edges of the generated clock. If the *divide_factor* is not a power of 2, the edges are scaled from the master clock edges.

Using **create_generated_clock** on an existing **generated_clock** object overwrites the attributes of the **generated_clock** object.

The **generated_clock** objects are expanded to real clocks at the time of analysis.

The following commands can reference the **generated_clock**:

```
set_clock_latency  
set_clock_uncertainty  
set_propagated_clock  
set_clock_transition
```

To display information about generated clocks, use the **report_clock** command.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example creates a frequency **-divide_by** 2 generated clock:

```
prompt> create_generated_clock -divide_by 2  
      -source CLK [get_pins foo]
```

The following example creates a frequency **-divide_by** 3 generated clock. If the master clock period is 30, and the master waveform is {24 36}, the generated clock period is 90 with waveform {72 108}.

```
prompt> create_generated_clock -divide_by 3
          -source CLK [get_pins div3/Q]
```

The following example creates a frequency **-multiply_by** 2 generated clock with a duty cycle of 60%:

```
prompt> create_generated_clock -multiply_by 2
          -duty_cycle 60 -source CLK [get_pins foo1]
```

The following example creates a frequency **-multiply_by** 3 generated clock with a duty cycle equal to the master clock duty cycle. If the master clock period is 30, and the master waveform is {24 36}, the generated clock period is 10 with waveform {8 12}.

```
prompt> create_generated_clock -multiply_by 3
          -source CLK [get_pins div3/Q]
```

The following example creates a generated clock whose edges are edges 1, 3, and 5 of the master clock source. If the master clock period is 30, and the master waveform is {24 36}, the generated clock period is 60 with waveform {24, 54}.

```
prompt> create_generated_clock -edges {1 3 5}
          -source CLK [get_pins foo2]
```

The following example shows the generated clock in the previous example with each derived edge shifted by 1 time unit. If the master clock period is 30, and the master waveform is {24 36}, the generated clock period is 60 with waveform {25, 55}.

```
prompt> create_generated_clock -edges {1 3 5}
          -edge_shift {1 1 1} -source CLK [get_pins foo2]
```

The following example creates an inverted clock:

```
prompt> create_generated_clock -divide_by 2 -invert
```

create_ilm

Creates an interface logic model (ILM) for the current design.

SYNTAX

```
status create_ilm
[-identify_only]
[-extract_only]
[-ignore_ports port_list]
[-no_auto_ignore]
[-latch_level levels]
[-keep_macros]
[-keep_boundary_cells]
[-keep_full_clock_tree]
[-include_side_load boundary | all | none]
[-traverse_disabled_arcs]
[-compact none | output | all]

[-scenarios scenario_list]
[-verbose]
```

Data Types

<i>port_list</i>	collection
<i>levels</i>	int
<i>scenario_list</i>	list

ARGUMENTS

-identify_only

Specifies that the interface logic of the design should be identified but not extracted. If you use this option, the extraction step is skipped. The default is to identify and extract interface logic.

-extract_only

Specifies that the interface logic of the design should be extracted but not identified. If you use this option, the command assumes that the interface logic has already been identified. The default is to identify and extract interface logic.

-ignore_ports *port_list*

Specifies the input and inout ports whose fanout or fanin is to be ignored when identifying the interface logic. Clock ports are automatically ignored; you do not have to specify them in this list.

You can use this option to exclude the fanout of ports connected to chip-level nets, such as scan enable and reset, from impacting the contents of interface logic. If these nets are not explicitly ignored, they cause unnecessary logic, such as internal registers, to be part of the interface

logic on the current design.

You can also use the **-ignore_ports** option to selectively generate interface logic for a subset of the ports on a block. For example, you can use it on an ILM that models only the timing behavior on a subset of the ports on a block.

The default is to use all nonclock ports in identifying the contents of interface logic.

For functional correctness of the design, all the ignore ports will be connected to already identified logic.

-no_auto_ignore

Disables the automatic determination of input and inout ports whose fanout should be ignored when identifying interface logic.

By default, **create_ilm** ignores a port if the percentage of the total registers in the design in the transitive fanout of the input or inout port is greater than or equal to the threshold percentage specified in the

ilm_ignore_percentage variable (default is 25). The ports thus ignored while doing the ILM traversal are then connected to already identified logic.

This default helps to identify the test enable and reset ports of your design.

Examine the current value of the **ilm_ignore_percentage** variable and change it, if needed. The default might potentially ignore ports you do not want to ignore or fail to ignore ports you do want to ignore. Carefully read the messages that the **create_ilm** command issues when you use default to see which ports have been ignored and to what percentage of registers they fanned out.

When you create a compact ILM (**-compact all**), **create_ilm** retains logic in the following three sets of critical timing path (max rise, max fall, min rise and min fall) for each clock source: 1. Port-to-port paths : Critical timing paths from each input ports to each output or inout ports. 2. Port-to-reg paths : Critical timing paths starting from each input ports and ending at registers. 3. Reg-to-port paths : Critical timing paths starting from registers and ending at inout or output ports. Along with the logic in these critical paths all logic from I/O ports to flip-flop or output ports and containing latches are retained. The number of latche levels retained can be controled by option **-latch_level**. Since complete fanout from an input/inout ports are not retained, this options is not applicable when creating a compact ILM.

-latch_level levels

Specifies the number of logic levels over which time borrowing can occur for latch chains that are part of the interface logic.

When you use this option, note that the value of *levels* must account for the borrowing behavior of latches only on interface timing paths. If *n* represents a latch level, *n* + 1 represents the number of latches maintained in latch chains that originate at input ports. The (*n* + 1)th latch functions as an edge-triggered register and decouples the I/O paths from the internal paths. Use this option only when there are latches in the interface logic for a block. Specifying this option might potentially result in less accurate models, because not all latches are allowed to borrow.

The default is to assume all latches found in interface logic are potential borrowers; thus, all logic from I/O ports to flip-flops or output ports are identified as belonging to interface logic.

-keep_macros

Specifies that all macro cells of the original design should be retained in the ILM. If you use this option, even the macro cells that are not part the

interface logic of the original design are included in the ILM. You can use the **-keep_macros** option to include all macros of the original design in the ILM. A cell is considered to be a macro cell if it is specified as macro in the physical library or if it is a large black-box cell. The default is not to retain macro cells of the original design that are not part of the interface logic.

-keep_boundary_cells

Includes boundary cells for all ignored ports. You might have specified the ignored ports by using the **-ignore_ports** option, or they might have been automatically selected by default.

Including the boundary cells ensures that design rule checking (DRC) from the top level considers the cells attached to ignored ports.

This option is no longer required because, by default, **create_ilm** either retains the connections from the ignored ports to the identified interface logic or it retains the timing critical boundary paths from the ignored ports. The side load inclusion on the boundary nets include any remaining cells not covered by these steps.

-keep_full_clock_tree

Retains the entire clock tree of all clocks created with the **create_clock** and **create_generated_clock** commands as part of the interface logic.

Because the entire clock tree of the block is retained in the ILM, the generated ILM is quite large.

The default is to retain the clock trees connected to the interface logic and the logic in the four critical clock paths (minimum rise, minimum fall, maximum rise, and maximum fall) from all clock sources for each scenario.

-include_side_load boundary | all | none

Specifies the side-load cells to include in the ILM. Side-load cells are not in the interface logic format, but they might affect the timing of an interface path.

Note that regardless of the value you specify, **create_ilm** always includes the side-load cells of all routed and extracted nets. This is done to ensure the most accurate ILM model for the postroute flow.

Use **boundary** for boundary side-load cells, which are those side-load cells on nets that are connected to the ports of the ILM. Including only boundary side-load cells in the ILM usually provides the best trade-off between model size and accuracy. This is the default option.

Use **all** to extract the most accurate model.

Use **none** to obtain the smallest possible (and less accurate) ILM.

-traverse_disabled_arcs

Specifies that the interface logic is not affected by disabled arcs and pins on the design. This option ignores the case analysis constraints to force the traversal of disabled arcs while determining interface logic. If you specify this option, the size of the model increases.

The default is to honor the constraints of the **set_case_analysis** command and not to traverse the timing arcs that are disabled due to case analysis. Thus the created ILM will not have such timing paths and logic.

The option '**-traverse_disabled_arcs**' is incompatible with option '**-compact all/output**' in **create_ilm** command. The option '**-traverse_disabled_arcs**' disables the **case_analysis**. Disabling the **case_analysis** values effect the timing critical paths. Since only timing critical paths are retained from each port in case of compact ILM (all/output), this option is not applicable

for '-compact all/output'.

-compact none | output | all
 Specifies the technique used to reduce the size of the ILM.
 By default (**-compact all**), the ILM contains retains logic in the following three sets of critical timing path (max rise, max fall, min rise and min fall) for each clock source: 1. Port-to-port paths : Critical timing paths from each input ports to each output or inout ports. 2. Port-to-reg paths : Critical timing paths starting from each input ports and ending at registers. 3. Reg-to-port paths : Critical timing paths starting from registers and ending at inout or output ports. Along with the logic in these critical paths all logic from I/O ports to flip-flop or output ports and containing latches are retained. The number of latche levels retained can be controled by option **-latch_level**. When you use this compaction technique, no ports are auto-ignored, because all the ports are analyzed for their associated timing-critical boundary paths.
 If you limit compaction to output ports only by using the **-compact output** option, the size of the ILM increases. This option keeps the logic on the critical paths to the output ports, but it prevents compaction on paths from the input ports.
 If you disable compaction altogether (**-compact none**), the ILM contains all logic from the boundary ports to the first flip-flop. If your design does not have complete and correct SDC files, you must use this option because compaction is slack-based for each port.

-case_controlled_ports port_list
 Specifies a list of input and inout ports on which the case analysis value can be set or modified at the top level.
 You can use this option to specify a set of ports whose case analysis value can change when linked with the top-level design. When this option is used, the compact ILM identifies the ports whose timing paths can be affected by the specified ports and treats them like non-compact ports. Non-compact interface logic is retained for these ports instead of only the four critical timing paths (minimum rise, minimum fall, maximum rise, and maximum fall). This option can also affect what logic gets included in a noncompact ILM (**create_ilm -compact none**), because the fanout from the port is treated as if case analysis was not applied on the port.

-must_connect_ports port_list
 Specifies a list of ports that must be connected to already identified logic for functional correctness of design.
 You can use this option to specify a set of ports, such as scan enable or reset, whose connectivity is necessary with the already identified logic. This option has no effect when used with the **-compact none** option, because **create_ilm** retains the entire fanout from all ports.

-keep_parasitics
 Includes detailed parasitics in the ILM view.
 If you do not invoke the **extract_rc** command before invoking this command, **extract_rc** is automatically run to extract the parasitics when you use this option. The design must be routed (global routing, track assignment, or detail routing) for **extract_rc** to succeed and generate the required parasitics. These parasitics in the ILM view are automatically used when the **extract_rc** command is run at the top level.
 If you plan to use the generated ILM in the top-level flow with coupling

capacitances (for example, use **extract_rc -coupling_cap** at the top level), the generated ILM must have coupling capacitances.

By default, the ILM is generated with coupling capacitances if you enabled the signal integrity options before generating the ILM or you specify the **-include_xtalk** option when you run **create_ilm**. To generate an ILM with coupling capacitances, the design must be either track assigned or detail routed.

If you plan to use the generated ILM in the top-level signal integrity flow use the **-include_xtalk** option when you run **create_ilm** to generate an ILM with both coupling capacitance data and signal integrity information.

The ILM generated by the **-keep_parasitics** option can be used as the timing and logic model for top-level timing-driven routing, postroute timing analysis and optimization, and the **route_opt** core command.

Note that top-level routing uses the FRAM view for routing, while top-level timing-driven routing uses the FRAM view for routing and the ILM for timing. This option is on by default if design is routed (global routing, track assignment, or detail routing) and is ignored for unrouted designs.

-include_xtalk

Stores signal integrity (SI) and coupling capacitance information with the ILM view.

This option is honored only when the design is track assigned or detail routed. It is ignored for unrouted or global routed designs.

-include_all_logic

Includes all cells, nets, and pins in the block in the ILM.

In general, you should not use this option, because the ILM can be huge if the block is huge. You should use this option only in special situations, such as for a clock generator block or for a very, very small block.

-scenarios scenario_list

Specifies a list of scenarios that must be used by tool to generate the ILM model. Interface logic is identified for each scenario and the union of the per-scenario interface logic is retained in the ILM.

By default, all scenarios are used for a multicorner-multimode design. To avoid high memory usage, you should activate only one scenario or a minimal set of scenarios before running this command. For more details, see the EXAMPLES section.

This option is not supported for non-multicorner-multimode designs.

-verbose

Prints comparative statistics about the number of design objects in the original design and in the ILM. By default, the command prints the comparative statistics.

DESCRIPTION

This command creates an interface logic model (ILM) for the current design by discarding all the logic that is not part of the interface logic. After command execution, the ILM model is saved to disk and the design in memory is the unmodified original design (the state before running **create_ilm**).

ILMs provide an accurate and robust model generation solution for a hierarchical design flow. ILMs embody a structural approach to model generation; the original

gate-level netlist for a block is modeled by another gate-level netlist that contains the interface logic of the block.

By preserving interface logic without any modification, an ILM is a highly accurate representation of the original design. An ILM does not abstract logic; it discards the logic that is not required for modeling boundary timing. For typical designs and technologies in postlayout flows, an ILM preserves the original block timing to within 10 ps.

The **create_ilm** command first determines the cells, nets, and pins of the current design that are part of the interface logic. The interface logic contains all logic whose timing is impacted by or impacts the external environment of a block (details given below).

The following cells and clock trees are part of interface logic:

- All cells in timing paths that lead from input ports to registers or output ports that terminate the paths.
- All cells in timing paths that lead to output ports from registers or input ports that originate the paths.
- The clock trees that drive interface registers, including any registers in the clock tree. Clock-gating circuitry is part of interface logic if it is driven by external ports, but not if it is driven by registered outputs on a block.

Notice that interface logic does not include internal register-to-register paths and logic on a block associated only with these paths.

The **create_ilm** command implicitly performs an **update_timing** on the design, if required.

The following physical design information is included in the ILM:

- Locations for all leaf cells in the ILM
- Locations for all ports of the ILM
- Nets that traverse the ILM boundary are specially marked so that wire length and capacitance for these nets are estimated again when you run the **place_opt** or **clock_opt** commands at the top level. When the wire-length estimation is performed for these nets, it is ensured that they go through the ILM port for greater accuracy.

Use of ILM models is expected to significantly improve both memory and run time for performing top-level optimization of large designs.

IEEE 1801 (UPF) constraints associated with the interface logic are retained in the ILM to enable the hierarchical UPF flow.

Multimode Notes

- **create_ilm** automatically detects the presence of multiple scenarios (multiple modes or corners). In this case, the interface logic is traversed for each scenario -- if an interface timing path is disabled in one scenario but enabled in another, the path is included in the interface logic. You must use the **-scenarios** option.
- The scenarios defined at the top and block levels must be identical in name and number. You must use the **-scenarios** option.
- To have the appropriate timing constraints from the ILMs available at the top level, you must either use the **propagate_constraints** command to propagate them up from the ILMs or use the **read_sdc** command to apply them from the top level.

Multicorner Notes

- Detailed parasitics are extracted and stored with the ILM for each specified TLUPlus file.
- The TLUPlus files used at the top and block levels must be identical across all scenarios.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example shows how to create an ILM for a multicorner-multimode design by specifying the list of scenarios with the **all_scenarios** command.

```
prompt> open_mw_cel top
prompt> extract_rc
prompt> create_ilm -scenarios [all_scenarios]
```

The following example shows how to create an ILM for a multicorner-multimode design by specifying the list of scenarios by name. You should have one or a minimal number of scenarios active prior to running this command.

```
prompt> open_mw_cel top
prompt> extract_rc
prompt> all_active_scenarios
prompt> create_ilm -scenarios {scenario1 scenario2 scenario3}
```

The following example shows how to save an ILM in a Milkyway design library. The ILM is saved in the ILM view of the Milkyway design library. The example creates an ILM for the current design specifying that the fanin and fanout of the reset and scan_enable ports should be ignored.

```
prompt> create_ilm -ignore_ports [get_ports {reset scan_enable}]
```

The following example sets the **ilm_ignore_percentage** variable to 50, so that a port is ignored if the percentage of the total design registers in its transitive fanout is greater than 50.

```
prompt> set ilm_ignore_percentage 50
ilm_ignore_percentage = "50"
prompt> create_ilm
```

The following example uses the **-keep_macros** and **-keep_boundary_cells** options. All macros and boundary cells for ignored ports are to be included in the ILM. The **-latch_level** option with a value of 1 states that the first latch encountered in I/O paths could potentially borrow, but the second latch can be treated as an edge-triggered device. Thus, two levels of latches are maintained in the interface logic.

```
prompt> create_ilm -keep_macros \
-keep_boundary_cells -latch_level 1
```

The following example shows the use of the **-keep_parasitics** option.

```
prompt> open_mw_cel f11
prompt> create_ilm -keep_parasitics
```

The following example includes the signal integrity (SI) information with the ILMs.

```
prompt> open_mw_cel f11
prompt> create_ilm -include_xtalk
```

create_ilm_models

Creates interface logic models (ILMs) for the specified macros of the design.

SYNTAX

```
status create_ilm_models
[-no_auto_ignore]
[-latch_level levels]
[-keep_full_clock_tree]
[-keep_parasitics]
[-verbose]
[-include_xtalk]
[-include_all_logic]
[-compact none | output | all [-in_context]]
[-scenarios scenario_list]
macro_reference_list
```

Data Types

<i>levels</i>	int
<i>scenario_list</i>	list
<i>macro_reference_list</i>	list

ARGUMENTS

-no_auto_ignore

Disables the automatic determination of input and inout ports whose fanout should be ignored when identifying interface logic.

By default, **create_ilm** ignores a port if the percentage of the total registers in the design in the transitive fanout of the input or inout port is greater than or equal the threshold percentage specified in the **ilm_ignore_percentage** variable (default 25). The ports thus ignored while doing the ILM traversal are then connected to already identified logic.

This default helps to identify the test enable and reset ports of your design. You should examine the current value of the **ilm_ignore_percentage** variable and change it, if needed. The default might potentially ignore ports you do not want to ignore or fail to ignore ports you do want to ignore. Carefully read the messages that the **create_ilm** command issues when you use default to see which ports have been ignored and to what percentage of registers they fanned out.

When you create a compact ILM (**-compact all**), **create_ilm** retains only the logic in the four critical timing paths (minimum rise, minimum fall, maximum rise, and maximum fall) from all input ports and to all output ports. Input and inout ports are never auto-ignored when creating a compact ILM, so it is not necessary to specify the **-no_auto_ignore** option.

-latch_level *levels*

Specifies the number of logic levels over which time borrowing can occur for latch chains that are part of the interface logic.

When you use this option, note that the value of *levels* must account for the borrowing behavior of latches only on interface timing paths. If *n* represents a latch level, *n* + 1 represents the number of latches maintained in latch

chains that originate at input ports. The $(n + 1)$ th latch functions as an edge-triggered register and decouples the I/O paths from the internal paths. Use this option only when there are latches in the interface logic for a block. Specifying this option might potentially result in less accurate models, because not all latches are allowed to borrow.

The default is to assume all latches found in interface logic are potential borrowers; thus, all logic from I/O ports to flip-flops or output ports are identified as belonging to interface logic.

When you create a compact ILM (**-compact all**), **create_ilm** retains only the logic in the four critical timing paths (minimum rise, minimum fall, maximum rise, and maximum fall) from all input ports and to all output ports. The **-latch_level** option is ignored for compact ILMs.

-keep_full_clock_tree

Retains the entire clock tree of all clocks created with the **create_clock** and **create_generated_clock** commands as part of the interface logic.

Because the entire clock tree of the block is retained in the ILM, the generated ILM is quite large.

The default is to retain the clock trees connected to the interface logic and the logic in the four critical clock paths (minimum rise, minimum fall, maximum rise, and maximum fall) from all clock sources for each scenario.

-keep_parasitics

Includes detailed parasitics in the ILM view.

If you do not invoke the **extract_rc** command before invoking this command, **extract_rc** is automatically run to extract the parasitics when you use this option. The design must be routed (global, track assign, or detail) for **extract_rc** to succeed and generate required parasitics. These parasitics in the ILM view are automatically used when the **extract_rc** command is run at the top-level.

If you plan to use the generated ILM in the top-level flow with coupling capacitances (for example, use **extract_rc -coupling_cap** at the top-level), the generated ILM must have coupling capacitances.

By default, the ILM is generated with coupling capacitances if you enabled the signal integrity options before generating the ILM or you specify the **-include_xtalk** option when you run **create_ilm**. To generate an ILM with coupling capacitances, the design must be either track assigned or detail routed.

If you plan to use the generated ILM in the top-level signal integrity flow use the **-include_xtalk** option when you run **create_ilm** to generate an ILM with both coupling capacitance data and signal integrity information.

The ILM generated by the **-keep_parasitics** option can be used as the timing and logic model for top-level timing-driven routing, postroute timing analysis and optimization, and the **route_opt** core command.

Note that top-level routing uses the FRAM view for routing, while top-level timing-driven routing uses the FRAM view for routing and the ILM for timing. This option is on by default if design is routed (global routing, track assignment, or detail routing) and is ignored for unrouted designs.

-verbose

Prints comparative statistics about the number of design objects in the original design and in the ILM. By default, the command prints the comparative statistics.

```

#include_xtalk
    Stores signal integrity (SI) and coupling capacitance information with the
    ILM view.
    This option is honored only when the design is track assigned or detail
    routed. It is ignored for unrouted or global routed designs.

#include_all_logic
    Includes all cells, nets, and pins in the block in the ILM.
    In general, you should not use this option, because the ILM can be huge if
    the block is huge. You should use this option only in special situations,
    such as for a clock generator block or for a very, very small block.

-compact none | output | all
    Specifies the technique used to reduce the size of the ILM.
    By default (-compact all), the ILM contains the logic in the four critical
    timing paths (minimum rise, minimum fall, maximum rise, and maximum fall)
    from each input port to the first flip-flop (or to an output port if it is a
    synchronous path), as well as the paths from flip-flops to output ports. When
    you use this compaction technique, no ports are auto-ignored, because all the
    ports are analyzed for their associated timing-critical boundary paths.
    If you limit compaction to output ports only by using the -compact output
    option, the size of the ILM increases. This option keeps the logic on the
    critical paths to the output ports, but it prevents compaction on paths from
    the input ports.
    If you disable compaction altogether (-compact none), the ILM contains all
    logic from the boundary ports to the first flip-flop. If your design does not
    have complete and correct SDC files, you must use this option because
    compaction is slack-based for each port.

-in_context
    Generates compact ILMs using the transition time at the inputs of the blocks
    in the top-level design. The generated ILMs are more accurate because they
    are in the context of the top-level design.

-scenarios scenario_list
    Specifies a list of scenarios that must be used by tool to generate the ILM
    model. Interface logic is identified for each scenario and the union of the
    per-scenario interface logic is retained in the ILM.
    By default, all scenarios are used for a multicorner-multimode design. To
    avoid high memory usage, you should activate only one scenario or a minimal
    set of scenarios before running this command. For more details, see the
    EXAMPLES section.
    This option is not supported for non-multicorner-multimode designs.

macro_reference_list
    Specifies the soft macros for which ILM models need to be created. This is a
    required option.

```

DESCRIPTION

This command creates interface logic models (ILMs) for the specified macros in the current design.

This command calls the **create_ilm** command to create the ILM for each soft macro.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example calls **create_ilm_models** in a design that contains 2 different soft macros blk1 and blk2.

In this example, the **create_ilm_models** command is called for a multicorner-multimode design by specifying the list of scenarios with the **all_scenarios** command. The scenario list is used for both blk1 and blk2.

```
prompt> open_mw_cel top
prompt> create_ilm_models -scenarios [all_scenarios] {blk1 blk2}
```

In this example, the **create_ilm_models** command is called for a multicorner-multimode design by specifying the list of scenarios by name. The scenario list is used for both blk1 and blk2.

```
prompt> open_mw_cel top
prompt> create_ilm_models -scenarios {scenario1 scenario2} {blk1 blk2}
```

SEE ALSO

all_scenarios(2)
create_ilm(2)
ilm_ignore_percentage(3)

create_lib_track

Creates wire tracks for a library.

SYNTAX

```
status create_lib_track
[-lib lib_name]
[-tile tile_name]
[-dir dir_list]
[-offset offset_list]
```

Data Types

<i>lib_name</i>	string
<i>tile_name</i>	string
<i>dir_list</i>	list
<i>offset_list</i>	list

ARGUMENTS

-lib lib_name
Specify library where wire track is created. If not specified, the wire tracks will be created in current open library.

-tile tile_name
Specifies the tile where the wire track information is stored. Default value is "unit" and therefore the information will be stored in unitTile.CEL.

-dir dir_list
Specifies preferred routing direction for each routing layer one by one. The list is enclosed in parenthesis {}. The format is -dir {poly V/H metall1 V/H metall2 V/H ...} Where 'V' for "vertical" and 'H' for "horizontal". Both mask name and user-defined layer name of routing layers can be used in the list.

-offset offset_list
Specifies offset for each routing layer one by one. The list is enclosed in parenthesis {}. The format is -offset {poly value metall1 value metall2 value ...} The unit of value is micron. Both mask name and user-defined layer name of routing layers can be used in the list.

DESCRIPTION

This command creates wire tracks for a library. If some routing directions or offsets in routing layers and poly layer are not set, Default value will be used. Incremental setting mode is supported. The recommended value of offset is one half of the pitch. A status indicating success or failure is returned.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example sets routing directions and offset for opened library "design", which has 9 routing layers. unitTile will store the wire track information.

```
prompt> open_mw_lib design
prompt> create_lib_track -dir {poly V metal1 H metal2 V \
metal3 H metal4 V metal5 H metal6 V metal7 H metal8 V \
metal9 H} -offset {poly 0.00 metal1 0.14 metal2 0.16 \
metal3 0.14 metal4 0.14 metal5 0.14 metal6 0.14 metal7 0.14 \
metal8 0.14 metal9 0.14
1
```

create_macro_fram

Extracts blockage, pin and via information of an import macro cell.

SYNTAX

```
integer create_macro_fram
[-library_name library_name]
[-cell_name cell_name]
[-preserve_all_metal_blockage]
[-routing_blockage_output_layer metBlk | rGuide | zeroG]
[-treat_all_blockage_as_thin_wire]
[-treat_metal_blockage_as_thin {collection_of_layers}]
[-extract_blockage_by_block_core_with_margin {collection_of_layer_value}]
[-extract_blockage_by_merge_with_threshold {collection_of_layer_value}]
[-identify_macro_pin_by_pin_text]
[-extract_pin_connectivity_through {collection_of_layers}]
[-poly_pin_text_layers {list_of_layers}]
[-m1_pin_text_layers {list_of_layers}]
[-m2_pin_text_layers {list_of_layers}]
[-m3_pin_text_layers {list_of_layers}]
[-m4_pin_text_layers {list_of_layers}]
[-m5_pin_text_layers {list_of_layers}]
[-m6_pin_text_layers {list_of_layers}]
[-m7_pin_text_layers {list_of_layers}]
[-m8_pin_text_layers {list_of_layers}]
[-m9_pin_text_layers {list_of_layers}]

[-m12_pin_text_layers {list_of_layers}]
[-m13_pin_text_layers {list_of_layers}]
[-m14_pin_text_layers {list_of_layers}]
[-m15_pin_text_layers {list_of_layers}]
[-pin_must_connect_area_layer_number {collection_of_layer_value}]
[-auto_pin_must_connect_area_threshold {collection_of_layer_value}]
[-extract_via_within_pin_area_only]
[-extract_via_on_layer {collection_of_layers}]
```

Data Types

<i>library_name</i>	string
<i>cell_name</i>	string
<i>collection_of_layers</i>	collection
<i>collection_of_layer_value</i>	collection
<i>list_of_layers</i>	list

ARGUMENTS

-library_name *library_name*
Specifies the library name.

-cell_name *cell_name*
Specifies the cell name to create macro fram.

-preserve_all_metal_blockage
 Preserves all metal blockage layers to metal layers in FRAM view. (The default is *false* for GDS_IN flow. Suggest to turn on for LEF_in standard cells.)

-routing_blockage_output_layer metBlk | rGuide | zeroG
 Specifies the routing blockage output layer.
 Where metBlk means metal_blockage;
 rGuide means route_guide;
 zeroG means zero_min_spacing_route_guide.
 (The default selection is metBlk.)

-treat_all_blockage_as_thin_wire
 Treats all blockage as thin wire. (The default is *false*. That is, all blockage will be treated as it is.)

-treat_metal_blockage_as_thin {collection_of_layers}
 Specifies the metal layers to treat metal blockages as thin. (By default, the fat-degree of metal blockage will be treated as it is.)

-extract_blockage_by_block_core_with_margin {collection_of_layer_value}
 Specifies the metal layers to extract blockages by block core with margins.
 (By default, all the masks {poly m1 m2 ... m15} will be extracted by *block_all* mode.)
 User must specify the value once the mask is specified,
 where value (the margin_value) means:
 -1 : block none
 0 : auto compute margin value (around 10 pitch)
 positive_number : user specified margin value

-extract_blockage_by_merge_with_threshold {collection_of_layer_value}
 Specifies the metal layers to extract blockages by merge with threshold.
 (By default, all the masks {poly m1 m2 ... m15} will be extracted by *block_all* mode.)
 User must specify the x and y once the mask is specified,
 where x = X_threshold; y = Y_threshold;
 where X_threshold means merge blockage by oversizing of value X_threshold in horizontal direction;
 where Y_threshold means merge blockage by oversizing of value Y_threshold in vertical direction;

-identify_macro_pin_by_pin_text
 Identifies macro pin by pin text.
 (The default is *false*:
 assume the macro cell is Synopsys
 Placed & Routed cell with pins already. Need to turn on this option for any GDS_in or LEF_in cell which needs to identify pins by pin texts.)
 When this option is OFF, all the following options are useless/disabled:
 -extract_pin_connectivity_through
 -polyc_pin_text_layers
 -m1_pin_text_layers
 -m2_pin_text_layers
 -m3_pin_text_layers
 -m4_pin_text_layers
 -m5_pin_text_layers

```

-m6_pin_text_layers
-m7_pin_text_layers
-m8_pin_text_layers
-m9_pin_text_layers
-m10_pin_text_layers
-m11_pin_text_layers
-m12_pin_text_layers
-m13_pin_text_layers
-m14_pin_text_layers
-m15_pin_text_layers

-extract_pin_connectivity_through {collection_of_layers}
    Specifies the cut layers to extract pin connectivity. (By default, while identifying a pin, no connectivity will be traversed through any via except the via layer(s) is specified.) If the pin texts are on the same layer(s) with the pin geometry, no need to specify the following pin_text_layers options. If pin texts are put on separate layer(s) from the pin geometry, please specify the pin_text_layers information for each of the corresponding mask.

-poly_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of poly pin.

-m1_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m1 pin.

-m2_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m2 pin.

-m3_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m3 pin.

-m4_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m4 pin.

-m5_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m5 pin.

-m6_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m6 pin.

-m7_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m7 pin.

-m8_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m8 pin.

-m9_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m9 pin.

-m10_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m10 pin.

-m11_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m11 pin.

```

```

-m12_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m12 pin.

-m13_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m13 pin.

-m14_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m14 pin.

-m15_pin_text_layers {list_of_layers}
    Specifies the text layer(s) of m15 pin.

-pin_must_connect_area_layer_number {collection_of_layer_value}
    Specifies the layers of pin-must-connect-area for metal layers. (There is no
    pin-must-connect-area by default for each pin. If user wants to force the
    router to connect some pin at a particular location, please provide the area
    geometry on a spare layer; where number_name means the layer number (or layer
    name or layer datatype name) of the geometry given layer.)

-auto_pin_must_connect_area_threshold {collection_of_layer_value}
    Specifies the auto pin-must-connect-area thresholds of metal layers. (By
    default, the first-dimension fat contact threshold will be used to calculate
    the pin-must-connect-area for a fat pin; so that the router will drop a (fat)
    contact completely inside a fat pin.)

-extract_via_within_pin_area_only
    Extracts via within pin area only. (By default, the option is false. That is,
    all the vias will be hidden without exposing to the top level. Suggest to
    turn on this option when user expects the router seeing the vias while
    connecting to a pin. )

-extract_via_on_layer {collection_of_layers}
    Specifies the mask layer(s) to extract vias. (By default, all the vias will
    be hidden without exposing to the top level. Suggest to specify the mask
    layer(s) when user expects the router seeing the vias on the corresponding
    mask while connecting pins.)

```

DESCRIPTION

For an import macro cell or a Synopsys Placed&Routed macro cell, extract its blockage, pin and via information for higher level placement & routing commands and store the result inside FRAM view.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```

prompt> create_macro_fram -library_name arc_rams_LM \
-cell_name evita \
-identify_macro_pin_by_pin_text \
-m3_pin_text_layers 33

```

SEE ALSO

`extract_blockage_pin_via(2)`

create_mw_cel

Creates a Milkyway design.

SYNTAX

```
status create_mw_cel
[-view CEL | FRAM | FILL | err | ILM]
[-verbose]
mw_cel_name
```

Data Types

mw_cel_name string

ARGUMENTS

-view CEL | FRAM | FILL | err | ILM

Specifies the view name of the Milkyway design to create. The **CEL**, **FRAM**, **FILL**, **err** and **ILM** arguments are mutually exclusive; you can use only one. By default, the command creates a **CEL** view Milkyway design.

-verbose

Prints additional messages.

mw_cel_name

Specifies the name of the Milkyway design to create. The length of a Milkyway design name must be less than 127 characters. Do not specify a view name or version in the *mw_cel name*. For example, *test.CEL* or *test.CEL;2* are not valid values for *mw_cel name*. To specify the view, use **-view** option.

DESCRIPTION

This command creates a new Milkyway design. It automatically opens this newly-created Milkyway design and sets it as the current Milkyway design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a Milkyway design named *top* for CEL view.

```
prompt> create_mw_cel top
{"top"}

prompt> current_mw_cel
{"top"}
```

The following example creates a Milkyway design named *top* for err view.

```
prompt> create_mw_cel top -view err
{"top"}
```

```
prompt> current_mw_cel
{"top"}
```

SEE ALSO

```

copy_mw_cel(2)
current_mw_cel(2)
get_mw_cels(2)
open_mw_cel(2)
remove_mw_cel(2)
rename_mw_cel(2)
save_mw_cel(2)
mw_cel_collection(2)
```

create_mw_lib

Creates a Milkyway library.

SYNTAX

```
status create_mw_lib
[-technology technology_file_name]
[-plib plib_file_name]
[-hier_separator sep]
[-bus_naming_style style]
[-mw_reference_library lib_list]
[-reference_control_file rc_file_name]
[-open]
libName
```

Data Types

<i>technology_file_name</i>	string
<i>plib_file_name</i>	string
<i>sep</i>	character
<i>style</i>	string
<i>lib_list</i>	string
<i>rc_file_name</i>	string
<i>libName</i>	string

ARGUMENTS

-technology *technology_file_name*

Specifies the name of the technology file for the newly created Milkyway library. This option and **-plib** are mutually exclusive.

-plib *plib_file_name*

Specifies the name of the plib file for the newly created Milkyway library. Valid file is of .plib format or .pdb format. This option and **-technology** are mutually exclusive. If routing directions in the .plib file are used to set preferred routing directions for the design library, you must specify the reference libraries by using the **-reference_control_file** or **-mw_reference_library** option.

-hier_separator *sep*

Specifies the character to be used as a separator in hierarchical names. The default hierarchical separator is slash (/).

-bus_naming_style *style*

Specifies the bus naming style for the library. The default bus naming style is [%d].

-mw_reference_library *lib_list*

Specifies a list of reference libraries to be used for the new library.

-reference_control_file *rc_file_name*

Specifies the reference control file used to set reference library

```
information for the new library.

-open
    Opens the library after creation.

libName
    Specifies the name of the Milkyway library to be created.
```

DESCRIPTION

This command creates a Milkyway library.

The **-technology** and **-plib** options are mutually exclusive, and at least one of them must be specified.

By default, the newly created Milkyway library is not open in the current session. To manipulate it, first run the **open_mw_lib** command. The library can also be opened by using the **-open** option, but to make the scripts more reusable, you should use **open_mw_lib**.

All strings stored in this library, as well as in designs belonging to it, are case-sensitive, and all string operations are performed as case-sensitive.

A status indicating success or failure is returned.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a Milkyway design library with a technology file and bus naming style as [%d]. The hierarchical separator is the default value slash (/).

```
prompt> create_mw_lib design -technology test.tf \
    -bus_naming_style {[%d]}
1
```

SEE ALSO

```
close_mw_lib(2)
open_mw_lib(2)
create_lib_track(2)
```

create_net

Creates nets in the current design or its subdesign.

SYNTAX

```
status create_net
[-power | -ground | -tie_high | -tie_low]
net_list
```

Data Types

net_list list

ARGUMENTS

-power

Creates a power net.

By default, the tool creates a signal net.

The **-power**, **-ground**, **-tie_high**, and **-tie_low** options are mutually exclusive; you can specify only one.

-ground

Creates a ground net.

By default, the tool creates a signal net.

The **-power**, **-ground**, **-tie_high**, and **-tie_low** options are mutually exclusive; you can specify only one.

-tie_high

Creates a tie-high net.

By default, the tool creates a signal net.

The **-power**, **-ground**, **-tie_high**, and **-tie_low** options are mutually exclusive; you can specify only one.

-tie_low

Creates a tie-low net.

By default, the tool creates a signal net.

The **-power**, **-ground**, **-tie_high**, and **-tie_low** options are mutually exclusive; you can specify only one.

net_list

Specifies the names of the created nets. If you specify a hierarchical net name, the net is created in the specified instance. The net name must be unique within the current design or the subdesign where it is created. If you use a hierarchical net name, the parent instance must be unique; it cannot be an instance of a multiply-instantiated design.

This is a required option.

DESCRIPTION

The **create_net** command creates new net objects in the current design or its subdesign, based on the *net_list* argument. The **create_net** command creates only

scalar (single bit) nets.

By default, this command creates signal nets.

To create a power net, use the **-power** option. To create a ground net, use the **-ground** option. To create a tie-high net, use the **-tie_high** option. To create a tie-low net, use the **tie_low** option. These four options are optional and mutually exclusive.

You can use this command to create the default tie-off nets, SNPS_LOGIC0 and SNPS_LOGIC1, if these nets do not already exist in the design. The type for these nets is determined by name only. SNPS_LOGIC0 and SNPS_LOGIC1 are special names in IC Compiler. They can only be of the type tie_low and tie_high, respectively.

Nets connect pins and ports in a design. When you create nets with **create_net**, they are not connected. To connect signal nets, use the **connect_net** command. To connect power and ground nets or tie-off nets to the power or ground rails, use the **derive_pg_connections** command.

To remove nets from the current design, use the **remove_net** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **create_net** to create net objects in the current design:

```
prompt> create_net {N1 N2 N3 N4}
prompt> get_nets *
```

The following example uses **create_net** to create net objects in the mid subdesign. Note that mid1 is an instance of the mid design. The mid design must be unique for the **create_net** command to succeed.

```
prompt> create_net {mid1/N1 mid1/N2 mid1/N3 mid1/N4}
prompt> get_nets mid1*
```

The following example uses **create_net** to create a power net:

```
prompt> create_net -power VDD
prompt> get_nets -all VDD
```

SEE ALSO

all_connected(2)
connect_net(2)
derive_pg_connection(2)
disconnect_net(2)
remove_net(2)

create_net_shape

Creates a new net shape.

SYNTAX

```
collection create_net_shape
[-type wire | path | rect | poly]
-origin point
| -points list_of_points
| -bbox rect
| -boundary boundary
[-length real]
[-width real]
[-path_type square | round | extend_half_width | octagon]
-layer layer
-net net_name
[-vertical]
[-route_type route_type]
[-datatype int]
[-avoid_short_segment]
```

Data Types

<i>point</i>	<i>point</i>
<i>list_of_points</i>	list of points
<i>rect</i>	rectangle
<i>boundary</i>	polygon
<i>real</i>	real
<i>layer</i>	collection
<i>net_name</i>	string
<i>route_type</i>	string
<i>int</i>	integer

ARGUMENTS

-type wire | path | rect | poly

Specifies the net shape type.

If you do not specify this option, the default net shape depends on how you specify the net shape. The net shape type is determined by using the following rules, in order of precedence:

1. If you use the **-origin** option, the net shape is **wire**.
The wire is horizontal, unless you also specify the **-vertical** option.
2. If you use the **-bbox** option, the net shape is **wire** if you also use the **-path_type**, **-route_type**, or **-vertical** options. If you do not use any of these additional options, the net shape is **rect**.
3. If you use the **-points** option, the net shape is **path**.
4. If you use the **-boundary** option, the net shape is **poly**.

-origin point
Specifies the origin of the net shape for wires.
When you specify this option, you must also specify the **-length** and **-width** options.
The **-origin**, **-points**, **-bbox**, and **-boundary** options are mutually exclusive.
You must specify one of these options.

-points list_of_points
Specifies the point sequence of the net shape for paths.
The **-origin**, **-points**, **-bbox**, and **-boundary** options are mutually exclusive.
You must specify one of these options.

-bbox rect
Specifies the bounding box of the net shape. You must specify the lower-left and upper-right corners of the rectangle by using the following syntax: {{llx lly} {urx ury}}.
The **-origin**, **-points**, **-bbox**, and **-boundary** options are mutually exclusive.
You must specify one of these options.

-boundary boundary
Specifies the boundary of the net shape. You must specify at least three nonoverlapping points.
The **-origin**, **-points**, **-bbox**, and **-boundary** options are mutually exclusive.
You must specify one of these options.

-length real
Specifies the length of the net shape for wires in user units.
This option is required when you specify the **-origin** option and ignored otherwise.

-width real
Specifies the width of the net shape for wires in user units.
This option is required when you specify the **-origin** or **-points** option and ignored otherwise.

-path_type square | round | extend_half_width | octagon
Specifies the alignment type of a wire or path end.
Possible values are:
square - square, no extension
round - round, half width extension
extend_half_width - square, half width extension
octagon - octagon, half width extension
The default is **square**.

-layer layer
Specifies the layer for the net shape. You can specify the layer by using the layer name from the technology file or by using the **get_layers** command.
This is a required option.

-net net_name
Specifies the net associated with the net shape.
This is a required option.

-vertical
Indicates that the wire is vertical.

create_net_shape

By default, the net shape is horizontal.

```
-route_type route_type
    Specifies the route type of the net shape. Valid values for this option are
        user_enter                                User entered
        signal_route, signal_route_detail          Detail routing
        signal_route_global                         Global routing
        pg_ring                                    Power or ground (PG) ring
        pg_strap                                   PG strap
        pg_macro_io_pin_conn                      PG net that connects to the PG pin
                                                   of an I/O pad cell or a macro cell
        pg_std_cell_pin_conn                      PG net that connects to the PG pin
                                                   of a standard cell
        clk_ring                                   Clock ring
        clk_strap                                  Clock strap
        clk_zero_skew_route                       Clock zero skew route
        bus                                         Bus
        shield, shield_fixed                     Fixed shield
        shield_dynamic                            Dynamic shield
        fill_track, clk_fill_track                Fill track
    By default, the route type is signal_route.
```

```
-datatype int
    Specifies the data type number.
    By default, the data type is 0.
```

```
-avoid_short_segment
    Specifies that segments shorter than a half width should be avoided for paths.
```

DESCRIPTION

This command creates a shape object that is attached to a net and returns a collection containing the created object.

The valid shape types are:

Wire (horizontal or vertical)
Path
Rectangle
Polygon

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a wire net shape.

```
prompt> create_net_shape -type wire -net VSS \
-origin {0 0} -length 10 -width 2 -layer M1
```

The following example creates a path net shape.

```
prompt> create_net_shape -type path -net {VSS} \
-path_type extend_half_width -layer M3 \
-points {{845 715} {845 710} {860 710}} -width 0.230
```

The following example creates a rectangular net shape.

```
prompt> create_net_shape -type rect -net {CLOCK_Net27} \
-bbox {{76 110} {82 115}} -layer METAL1
```

SEE ALSO

`create_user_shape(2)`
`create_placement_blockage(2)`
`create_route_guide(2)`
`create_via(2)`
`create_terminal(2)`
`create_text(2)`

create_open_drc_error

Creates an error record of an error type in the "Open" type class.

SYNTAX

```
collection create_open_drc_error
-type error_type
[-status error_status]
[-info description]
[-error_view mw_error_view]
[-net net]
[-details details]
```

Data Types

<i>error_type</i>	string
<i>error_status</i>	string
<i>description</i>	string
<i>mw_error_view</i>	list or collection
<i>net</i>	list or collection

ARGUMENTS

-type *error_type*

An error type id or name of the new error object. The given type must be in the "Open" type class. This argument is required.

-status *error_status*

The current status of this error. Must be one of {Error, Fixed, Ignored, Waived}. If omitted, it is set to "Error."

-info *description*

A full description of this error. If omitted, left empty.

-error_view *mw_error_view*

The error view in which to create the error record. If omitted, the error record will be created in the current toplevel design cell. Specifying more than one error view causes an error.

-net *net*

The net in which the open was found, as a collection of id or name. If omitted, no net will be associated with the open error.

-details *details*

The details of the error including shapes and layers. This argument is optional. However, an open error with no details is virtually useless. Details may be added using the command `add_open_drc_error_detail`. Note that details for open drc errors, if given, must include node numbers and shapes.

DESCRIPTION

This command creates a new error object of the given type in the type class "Open". Every error object must be associated with one and only one error type. The error type association for an error object is made when the error object is created and is immutable. The error type association with a type class is made when the error type is created and is immutable. Therefore, an error type in the "Open" type class must be first created before error objects of an "Open" type class can be created.

The command returns a collection with the new error object if successful.

An error type in the "Open" type class is for violations where routed shapes for a net are not fully connected. An Open type error is described by disjoint nodes. A node is a set of connected route shapes. An open net will contain two or more disjoint nodes. A node may require multiple shape constructs to describe if there are shapes on different layers in the node. Each node is numbered and multiple shapes can be identified as being parts of the same node. Descriptions of node shapes can be added using the -details option of the create_open_drc_error command or with the add_open_drc_error_detail command.

EXAMPLES

The following example opens an error view named "mydesign_idrc.err" and creates an error type named "Open Net" in the "Open" type class, then creates an error record of the type:

```
prompt> set cellId [open_mw_cel -not_as_current mydesign_idrc.err]
{mydesign_idrc}
prompt> set typeId [create_drc_error_type -name "Open Net" -class "Open" \
    -info "There are opens in the net" -error_view $cellId]
1024
prompt> create_open_drc_error -type $typeId -error_view $cellId \
    -

create_open_locator_drc_error

Creates an error record of an error type in the "OpenLocator" type class.

SYNTAX

```
collection create_open_locator_drc_error
-type error_type
-point1 point
-point2 point
[-status error_status]
[-info description]
[-net net]
[-referenced_drc_error drc_error]
[-error_view mw_error_view]
```

Data Types

<i>error_type</i>	string
<i>error_status</i>	string
<i>description</i>	string
<i>net</i>	list or collection
<i>drc_error</i>	list or collection
<i>mw_error_view</i>	list or collection

ARGUMENTS

```
-type error_type
    An error type id or name of the new error object. The given type must be in
    the "OpenLocator" type class. This argument is required.

-point1 point
    One endpoint of the flyline describing the open locator. This argument is
    required.

-point2 point
    Second endpoint of the flyline describing the open locator. This argument is
    required.

-status error_status
    The current status of this error. Must be one of {Error, Fixed, Ignored,
    Waived}. If omitted, it is set to "Error."

-info description
    A full description of this error. If omitted, left empty.

-net net
    The net in which the open was found, as a collection of id or name. If omitted,
    no net will be associated with the open error.

-referenced_drc_error drc_error
    The error object id for the Open type error associated with this OpenLocator
    error. Since OpenLocator type errors describe a possible connection for an
```

Open, the writer of the error may associate the OpenLocator with the Open error for the same net.

-error_view *mw_error_view*

The error view in which to create the error record. If omitted, the error record will be created in the current toplevel design cell. Specifying more than one error view causes an error.

DESCRIPTION

This command creates a new error object of the given type in the type class "OpenLocator". Every error object must be associated with one and only one error type. The error type association for an error object is made when the error object is created and is immutable. The error type association with a type class is made when the error type is created and is immutable. Therefore, an error type in the "OpenLocator" type class must be first created before error objects of an "OpenLocator" type class can be created.

The command returns a collection with the new error object if successful.

An error type in the "OpenLocator" type class is for violations describing opens in nets, not as disjoint nodes of connected shapes, but as the potential connection flyline for an open. For this reason, where there exists a single "Open" type error object for a net with one or more opens, there are n "OpenLocator" type error objects for a net with n opens (with n+1 disjoint nodes).

EXAMPLES

The following example opens an error view named "mydesign_idrc.err" and creates an error type named "Open Connection", then creates an error record of the type:

```
prompt> set cellId [open_mw_cel -not_as_current mydesign_idrc.err]
{mydesign_idrc}
prompt> set openLocatorTypeId [create_drc_error_type -name "Open Connection" \
    -class "OpenLocator" \
    -info "A connection flyline for an open net" -error_view $cellId]
1024
prompt> set openTypeId [create_drc_error_type -name "Open Net" -class "Open" \
    -info "Opens in the net" -error_view $cellId]
1025
prompt> set openErrId [create_open_drc_error -type $ typeId -error_view $cellId \
    -net [get_nets myNetA] \
    -
details {2 {{node 1} 1 {{layer METAL2} 1 {574.0700 430.3600 578.9700 430.3600}}} \
    {{node 2} 1 {{layer METAL4} 1 {574.0700 436.3600 574.0700 453.36
00}}}]
{1280}
prompt> create_open_locator_drc_error -type $openLocatorTypeId - \
error_view $cellId \
    -net [get_nets myNetA] \
    -referenced_drc_error $openErrId \
    -point1 {{node 1} {layer METAL2} 574.0700 430.3600} \
    -point2 {{node 2} {layer METAL4} 574.0700 436.3600}
```

{1281}

create_operating_conditions

Creates a new set of operating conditions in a library.

SYNTAX

```
int create_operating_conditions
-name name -library library_name
-process process_value
-temperature temperature_value
-voltage voltage_value
[-tree_type tree_type]
[-calc_mode calc_mode]
[-rail_voltages rail_value_pairs]
```

Data Types

<i>name</i>	string
<i>library_name</i>	string
<i>process_value</i>	float
<i>temperature_value</i>	float
<i>voltage_value</i>	float
<i>tree_type</i>	string
<i>calc_mode</i>	string
<i>rail_value_pairs</i>	list

ARGUMENTS

-name *name*
Specifies the name of the new set of operating conditions.

-library *library_name*
Specifies the name of the library for the new operating conditions.

-process *process_value*
Specifies the process scaling factor for the operating conditions. Allowed values are 0.0 through 100.0.

-temperature *temperature_value*
Specifies the temperature value, in degrees Celsius, for the operating conditions. Allowed values are -300.0 through +500.0.

-voltage *voltage_value*
Specifies the voltage value for the operating conditions. Allowed values are 0.0 through 1000.0.

-tree_type *tree_type*
Specifies the tree type for the operating conditions. Allowed values are *balanced_tree* (the default), *best_case_tree*, or *worst_case_tree*. The tree type is used to estimate interconnect delays by providing a model of the RC tree.

-calc_mode calc_mode

For use only with DPCM libraries. Specifies the DPCM delay calculator mode for the operating conditions. Allowed values are *unknown* (the default), *best_case*, *nominal*, or *worst_case*. If you use the default value, the *worst_case* value will be used during analysis. If **-rail_voltages** is specified, the command sets corresponding (*worst_case*, *nominal*, and *best_case*) voltage values.

-rail_voltages rail_value_pairs

Specifies a list of name-value pairs that defines the voltage for each specified rail. The name is one of the rail names defined in the library; the value is the voltage to be assigned to that rail. By default, rail voltages are determined by the values given to them in the library. Use this option to override the default voltages for the specified rails.

DESCRIPTION

The **create_operating_conditions** command creates a new set of operating conditions in the specified library. A technology library contains a fixed set of operating conditions. This command allows you to create new and additional operating conditions.

To see the operating conditions defined for a library, use **report_lib**.

To set operating conditions on the current design, use **set_operating_conditions**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a new set of operating conditions called WC_CUSTOM in the library "tech_lib", specifying new values for process, temperature, voltage, parameter1, and tree type. By default, rail voltages remain as defined in the library.

```
prompt> create_operating_conditions -name WC_CUSTOM \
-library tech_lib -process 1.2 -temperature 30.0 -voltage 2.8 \
-parameter1 1.2 -tree_type worst_case_tree
```

The following example creates a new set of operating conditions called OC3 in the library "IBM_CMOS5S6_SC", specifying new values for process, temperature, voltage, and rail voltages for rails VTT and VDDQ. By default, the tree type *balanced_tree* is used.

```
prompt> create_operating_conditions -name OC3 \
-lib IBM_CMOS5S6_SC -proc 1.0 -temp 100.0 -volt 4.0 \
-rail_voltages {VTT 3.5 VDDQ 3.5}
```

SEE ALSO

`report_lib(2)`
`set_operating_conditions(2)`

create_pad_rings

Creates pad rings for pins in boundary pads.

SYNTAX

```
integer create_pad_rings
[-create all | pg | specified_net]
[-nets {collection_of_nets}]
[-route_pins_on_layer number_or_name]
[-min_shrink_routing_boundaries_for_all_boundary_pads distance]
[-max_shrink_routing_boundaries_for_all_boundary_pads distance]
[-undo]
```

Data Types

<i>collection_of_nets</i>	collection
<i>number_or_name</i>	string
<i>distance</i>	distance

ARGUMENTS

```
-create all | pg | specified_net
    Determines which nets to route. Valid arguments are all, pg, and
    specified_net. Using all routes all nets. Using pg routes only power and
    ground nets. Using specified_net routes only the nets specified in the -nets
    option. The default is all.
```

```
-nets {collection_of_nets}
    Specifies the nets to create pad rings. If you specify more than one net in
    a collection they must be separated by a space. This option is required if
    you are using the -create option with the specified_net value.
```

```
-route_pins_on_layer number_or_name
    Specifies the layer on which to connect pins. The number_or_name value can be
    specified as either the layerNumber or maskName from the technology file. By
    default, the command considers all metal layers.
```

```
-min_shrink_routing_boundaries_for_all_boundary_pads distance
    Specifies the minimum amount by which to shrink routing boundaries of all
    boundary pads to make the pad pins accessible for routing. Enter a positive
    number to shrink the routing boundaries or a negative number to expand them.
    A boundary pad is a pad "near enough" to the top-cell boundary. Routing
    boundaries are the two sides of the boundary pads that can be touched by the
    generated pad ring or rings. Note that the command does not change the
    physical size of the routing boundary pads. It accomplishes a shrinking of
    the boundary pads by changing how far into the pad the program looks to find
    pins. It assumes the boundary is rectangular. The default is 0.0.
```

```
-max_shrink_routing_boundaries_for_all_boundary_pads distance
    Specifies the maximum amount by which to shrink routing boundaries of all
    boundary pads to make the pad pins accessible for routing. See the -
    min_shrink_routing_boundaries_for_all_boundary_pads option, above, for how
```

this option works. The default is **0.0**.

-undo

Removes pad rings created by the last **create_pad_rings** run.

DESCRIPTION

This command creates pad rings for pins only in boundary pads. The generated rings do not cover pad pins. The width of the pad ring is the smaller width of the two pins for the wire being created. You can change the internal application of DRC rules by using the **set_preroute_drc_strategy** command.

Prerequisites: Before using this command, use the **connect_pg_nets** command to specify port-to-net connections for power and ground nets if they are not part of the netlist. Wires are created only between two pins on the same net and on the same layer.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates pad rings with VDDC and VSSC nets, for pins on layer M3, shrinking boundaries by a minimum distance of 5.0 and a maximum distance of 6.0.

```
prompt> create_pad_rings -create specified_net -nets {VDDC VSSC} \
-route_pins_on_layer M3 \
-min_shrink_routing_boundaries_for_all_boundary_pads 5.0 \
-max_shrink_routing_boundaries_for_all_boundary_pads 6.0
```

create_partition

Creates and manipulates partitions in a design through command-line specification, autopartitioning, or manual GUI-based changes.

SYNTAX

```
status create_partition
[-input_files files]
[-reset overrides | partition | keepouts | all]
[-auto_partition instance_count | area]
[-physical]
[-logical]
[-area sub_block_area]
[-internal_keepout keepout]
[-external_keepout keepout]
[-utilization block_utilization]
[-aspect_ratio float]
[-force]
[-output_dir dir_name]
[-create verilog_files | design | top_level_floorplan]
[-verbose]
[module_name_list]
```

Data Types

<i>files</i>	string list
<i>sub_block_area</i>	float, area in square microns
<i>keepout</i>	positive float, keepout size in micron
<i>block_utilization</i>	float, > 0, <= 1, block utilization percentage
<i>dir_name</i>	string
<i>module_name_list</i>	string list

ARGUMENTS

-input_files *files*

Specifies that a partition is to be created by using one or more Verilog files. The structure of the Verilog files does not matter. Each module must be defined only once. All unused modules will remain as independent top modules.

-reset *overrides* | *partition* | *keepouts* | *all*

Resets some or all of the computed parameters in the partition. Possible choices are *overrides*, which resets any areas or utilization settings that were overridden; *partition*, which resets any partitioning choices that were made manually or through autopartitioning; *keepouts*, which resets any keepouts that were set; or *all*, which does all of these things.

-auto_partition *instance_count* | *area*

Chooses autopartitioning as part of the partitioning for this object. You can choose *instance_count*, which balances partitions based on equalizing the number of instances in each partition, or you choose *area*, which balances partitions based on the size of the area.

-physical
Indicates that the blocks in the *module_name_list* will be labelled as physical (and logical) blocks, labelling them as partitions. Note that the top block in a design is by definition physical and logical. This option is mutually exclusive with the **-logical** option.

-logical
Indicates that the blocks in the *module_name_list* will be labelled as logical-only blocks, labelling them as internal (logical) hierarchy. Note that the top block in a design is by definition physical and logical. This option is mutually exclusive with the **-physical** option.

-area sub_block_area
Allows you to set or to override the area for a given block within the hierarchy. This option should be used in a top-down design flow when one or more (presumably large) blocks are missing, but their estimated area is known. This can result in more properly considering the missing blocks expected contribution during area-based autopartitioning and during top-down, black-box shaping and floorplanning. There is no restriction on whether or not the overridden block is a physical block.
In some circumstances a block might already have a well-defined area but the designers are aware that a change is coming that will result in a different area. A designer can get a head start on refloorplanning the design by overriding the area on the current version of the block. Note that in this case, using this option will fail with an error message unless it is used with the **-force-fP option**.

-internal_keepout keepout
Sets an internal keepout on the given blocks. This keepout will be added to the area of the block. If that block is partitioned into a physical block, it will become larger by the internal keepout. The default internal keepout is 0.

-external_keepout keepout
Sets an external keepout on the given blocks. This keepout will be added to the area of the block but it will not cause the partitioned physical block to become larger. Note, however, that adding to the area of the block will cause the parents of this block to be larger. The default external keepout is 0.

-utilization block_utilization
Allows you to specify the utilization on modules. There are two ways to do this. First, if used with the **-input_files** option, it will set a default utilization on all modules. Second, if used with a *module_name_list*, it will override the default utilization on the specified modules. The set utilization is used along with the leaf cell areas to compute the required area for the physical blocks. Note that in some cases you might need to use the **-force** option to have this work.

-aspect_ratio float
Allows you to specify a target aspect ratio (height/width) for the chip to be created using the **-create_top_level_floorplan** option. The default aspect ratio is 1.

-force

Use this option with the **-area** option to allow the area of a block with a well-defined area (one that has a fully-complete subhierarchy with bindings to all instantiated leaf cells) to be overridden. An error results if you try and set the area of a block that is not missing without using this option. This option is needed if you use the **-utilization** option on multiply instantiated modules.

-output_dir dir_name

When designs are created for the physical partitions, Verilog files for the top level and each of the subblocks are created. This option specifies the output directory in which these files are placed. It defaults to the directory **sub_blocks** in the current directory.

-create verilog_files | design | top_level_floorplan

Causes the designs for the top level and the subblocks to be output in a specified format. If *verilog_files* is specified, the verilog files are output into the specified output directory. If *design* is specified, the verilog files are output and the top-level design is read into the system and becomes the current design. If *top_level_floorplan* is specified, then after the design is read into the system, a basic top-level floorplan will be generated.

-verbose

The **create_partition** command outputs more detailed messages.

module_name_list

This is a list of modules contained in the design that are to be operated upon by the other settings of the command. Note that many of the options are exclusive. This may lead to several calls to **create_partition** in order to set the proper partition attributes on the needed blocks. This is perfectly normal.

DESCRIPTION

This command allows you to create and manipulate partitions in a design by manual command-line specifications, by autopartitioning, or by interactive GUI-based changes. It can be used to create Verilog files that represent the top level and subblocks in the design, and it can read in the top level of the design, creating a top-level database for this design. It can also create a basic top-level floorplan.

Note that this command does not change the logical hierarchy so SDC constraints are still valid and do not need to be modified. Also, the Verilog files that are output from this command are subsets (substrings) of the Verilog text from input Verilog. In other words, if the input is 100 percent Verilog compliant, then the output is 100 percent Verilog compliant. And, if the input is not 100 percent Verilog compliant, then the output is equally not 100 percent Verilog compliant.

Manual, command-line partition modification is accomplished by labelling one or more modules as **-physical** or **-logical**. Use **-physical** to label a block as a physical partition. Use **-logical** to remove the block as a physical partition. This can be used to change the result of autopartitioning or to provide a partially partitioned design to autopartitioning.

There are two methods of autopartitioning. The first method creates partitions that

that typically represent 5-10 percent of the design, as measured by instance count. This is a very quick partitioning that works well for designs with few macro cells and with well-structured RTL. The second method creates partitions that typically represent 5-10 percent of the design, as measured by area. This is a very quick partitioning that works better than the default for designs with many hard macros. It also requires well-structured RTL for good results.

As stated above, this command can be used by making several independent calls, each one making a slight modification to the partition, with the final call creating the Verilog files and the top-level design.

EXAMPLES

This example creates a partition, sets the utilization on all the modules, labels subblock physical partitions, and creates the top level of the design:

```
prompt> create_partition -input_files {myDesign.v} -utilization 0.85
Partition Name: pfe0
Loading verilog file myDesign.v
MYDESIGN: 73958 instances of 134 modules.
1
prompt> create_partition -
physical "BLENDER_0 BLENDER_1 BLENDER_2 BLENDER_3 BLENDER_4"
1
prompt> create_partition -create design
(lots of messages from import_design)
1
```

This example shows autopartitioning.

```
prompt> create_partition -input_files {myDesign.v}
Partitioner Name: pfe0
Loading verilog file '../ICC_DATA/Netlist/myDesign.v'
MYDESIGN: 73958 instances of 134 modules.
1
prompt> create_partition -auto_partition instance_count
After partitioning, list of sub-blocks is BLENDER_0 BLENDER_1 BLENDER_2 BLENDER_3
1
```

SEE ALSO

initialize_floorplan(2)

create_pg_network

Create or change power/ground network connecting multiple hierarchical cells.

SYNTAX

```
status create_pg_network
[-net net
 | -create_net net_name [-power
 | -ground]]
[icell_list]
```

Data Types

<i>net</i>	list
<i>net_name</i>	string
<i>cell_list</i>	list

ARGUMENTS

-net *net*
Specifies the existing PG net for network creation. The net must be a power or ground net, a scalar (single bit) net, and must exist in the current design.
The net can be at any hierarchy level.
The base name of the net name is used to create net in specified hierarchy instances. For example, if the specified net named "blk1/VDDC", its base name is "VDDC" and created net and port in specified hierarchy instance will be named "VDDC".
For "-net" option, PG net type is derived from the given existing net. Therefore, neither "-power" nor "-ground" should be specified.
This argument is optional. If it is not specified, "-create_net" option must be specified.

-create_net *net_name*
Specifies the name of the Milkyway PG net that will be created to connect the specified hierarchical cell instances.
This argument is optional. If it is not specified, "-net" option must be specified.

-power
Specifies power net type.

-ground
Specifies ground net type.

cell_list
Specifies a list of hierarchical cell instances to which the PG network is created.
The tool issues an error message and stop if the port or net to be created already exists in a given cell.
If anything in the list is not found or is not a hierarchical cell, the command will issue an error message and stop. This argument is not optional.

the tool issues an error message and stop if this option is missing.

DESCRIPTION

This command creates a new hierarchical PG connection or expands existing PG net hierarchical connection on a list of given hierarchical cell instances. Existing PG nets include nets created by **create_net**, **create_pg_network**, and **read_verilog**. This command only make connection on given hierarchy instance and does not connect leaf pins.

Both "-net" and "-create_net" cannot be specified at the same time. However, at least one of the two must be specified.

For each specified hierarchical cell, a new net and a new port will be created. The port and net names are the same. The name is either specified by "-create_net" option or the same as the base name of the net specified by "-net" option. For example, if a net's full name is m1/m2/net1, its base name is net1.

The tool issues an error message and stop if the port or net to be created already exists in a given cell.

The direction of created port is "inout".

EXAMPLES

The following example uses the **create_pg_network** to expand existing VDD connection to a list of specified cells. The **all_connected** command is used to verify the Milkyway net connection before and after the command.

```
prompt> all_connected [get_pin -all m2/VDD]
Warning: No pin objects matched 'm2/VDD' (SEL-004)
prompt> create_pg_network -net VDD "m2/m21 m1/m11"
prompt> all_connected [get_pin -all m2/VDD]
{VDD}
```

The following example uses the **create_pg_network** to create an existing VDD connection to a single cell. The **all_connected** command is used to verify the Milkyway net connection before and after the command.

```
prompt> create_pg_network -net VDD "m2/m21"
prompt> get_nets -all -hierarchical VDD
{m2/VDD m2/m21/VDD}
prompt> all_connected [get_pin -all m2/m21/VDD]
{m2/m21VDD}
```

The following example uses the **create_pg_network** to create a new VDDC connection to a list of specified cells. The **all_connected** command is used to verify the Milkyway net connection before and after the command.

```
prompt> all_connected [get_pin -all m2/VDDC]
Warning: No pin objects matched 'm2/VDDC' (SEL-004)
prompt> create_pg_network -create_net VDDC -type power "m2/m21 m1/m11"
prompt> all_connected [get_pin -all m2/VDDC]
{VDDC}
```

create_physical_bus

Creates a physical bus with a list of nets.

SYNTAX

```
collection create_physical_bus
  name
  -nets net_list
  [-sort {ascending | descending | none}]
  [-delimiter delimiter]
  [-right_precedence]
  [-quiet]
```

Data Types

name	string
net_list	list
delimiter	string

ARGUMENTS

name
Specifies physical bus name.

-nets net_list
Specifies a list of nets to be members of newly created physical bus.

-sort {ascending | descending | none}
Specifies the sort mode. The valid values are: **ascending**, **descending**, and **none**.
If you specify *-sort ascending*, nets will be sorted by their names alphanumerically, from lowest to highest. If you specify *-sort descending*, nets will be sorted by their names alphanumerically, from highest to lowest.
If you specify *-sort none*, no sort will be applied.
By default *sort_mode* is *none*.

-delimiter delimiter
Specifies the delimiter characters to use for the names of nets.
The valid values of *delimiter* are: **[]**, **{}**, **<>**, **()**, **_** and **::**. By default *delimiter* is **[]**.
When nets are sorted, characters inside *delimiter* will be regarded as index.
For example, Two nets Net[2] and Net[10] with *-sort ascending*, Net[2] will be in front of Net[10].

-right_precedence
Indicates that sorting of index inside *delimiter* is from right to left. By default the order is from left to right.
For example, there are six nets with *-sort ascending* and no option **-right_precedence**, the ordered list will be:
Net[0][1], Net[0][2], Net[1][1], Net[1][2], Net[2][1], Net[2][2],
While with *-sort ascending* and option **-right_precedence**, the ordered list will be:

```
Net[0][1], Net[1][1], Net[2][1], Net[0][2], Net[1][2], Net[2][2],
-quiet
    Suppresses warning and error messages. Syntax error messages are not
    suppressed.
```

DESCRIPTION

The **create_physical_bus** command creates a new physical bus.

Physical bus is an ordered collection of flat nets, which will be used in bus driven routing.

If succeeded, this command would return a collection containing the new created physical bus. If failed, this command would return an empty string.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a physical bus of name "bus1", and then use command **get_nets -of_object \$bus1** to see the elements in the physical bus.

```
prompt> set bus1 [create_physical_bus bus1 -sort ascending \
-nets [get_nets UPC_DATA*]
{bus1}

prompt> get_nets -of_object $bus1
{UPC_DATA[0] UPC_DATA[1] UPC_DATA[2] UPC_DATA[3] UPC_DATA[4] UPC_DATA[5] UPC_DATA[6]
] UPC_DATA[7] UPC_DATA[8] UPC_DATA[9] UPC_DATA[10] UPC_DATA[11]}
```

SEE ALSO

```
get_nets(2)
get_physical_buses(2)
remove_physical_bus(2)
report_physical_bus(2)
update_physical_bus(2)
```

create_physical_buses_from_patterns

Automatically groups nets into buses based on their net name and group size criteria.

SYNTAX

```
status create_physical_buses_from_patterns
[-net_name_prefix string]
[-net_order ascending | descending]
[-minimum_nets integer]
[-maximum_nets integer]
[-divider integer]
[-no_braces]
[-no_brackets]
[-no_angle_brackets]
[-no_underscores]
[-no_colons]
[-no_parentheses]
```

ARGUMENTS

```
-net_name_prefix string
    Specifies net name prefix for pattern matching.

-net_order ascending | descending
    Specifies net sorting order (Default is ascending).

-minimum_nets integer
    This is bus size constraint option. It specifies minimum number of nets per bus (default is 8).

-maximum_nets integer
    This is bus size constraint option. It specifies maximum number of nets per bus (default is 128).

-divider integer
    This is bus size constraint option. It specifies allowed numbers of signals in the bus (default is 1).

-no_braces
    Don't use braces in pattern matching

-no_brackets
    Don't use brackets in pattern matching

-no_angle_brackets
    Don't use angle brackets in pattern matching

-no_underscores
    Don't use underscores in pattern matching
```

```
-no_colons
    Don't use colons in pattern matching

-no_parentheses
    Don't use parentheses in pattern matching
```

DESCRIPTION

This command groups automatically nets into buses based on their net name and group size criteria. Defining buses with a net name pattern saves time for designs with many buses, because nets are usually grouped by their names. The net name pattern specification is done implicitly with set of options. User can specify the net name pattern where the net bit order and index are to be extracted. After the nets are grouped, each net group has a specified size. Only net groups with specified sizes are automatically defined as buses. The following net name patterns are supported:
..[i]..., ..{i}..., ..<i>..., ..(i)..., .._i..., ..:i..

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example searches then nets with given name prefix and creates buses.

```
prompt> create_physical_buses_from_patterns -net_name_prefix ACMD
1
```

SEE ALSO

`create_physical_bus(2)`
`get_physical_buses(2)`

create_pin_guide

Creates a pin guide for a plan group, or soft macro, or the current cell to constrain terminals generated by pin assignment to a specified bounding box.

SYNTAX

```
pin_guide create_pin_guide
{-bbox bounding_box_rect
 | -boundary rectilinear_boundary}
[-parents soft_macro_or_plan_group]
[-name pin_guide_name]
objects
```

Data Types

<i>bounding_box_rect</i>	x1 y1 x2 y2
<i>rectilinear_boundary</i>	boundary points
<i>soft_macro_or_plan_group</i>	collection
<i>pin_guide_name</i>	string
<i>objects</i>	collection

ARGUMENTS

-bbox *bounding_box_rect*

Specifies the bounding box of a rectangular pin guide.
Constrains pins associated with the pin guide to the region where this bounding box overlaps the edges of the parent plan group or soft macro.
The **-boundary** and **-bbox** options are mutually exclusive; use only one.
If the bounding box does not overlap an edge, it is ignored.

-boundary *rectilinear_boundary*

Specifies the boundary points of a rectilinear pin guide.
This option serves the same purpose as the **-bbox** option, except that it allows you to specify a rectilinear pin guide.
The *boundary* argument is a series of points that defines the boundary of the pin guide.
The **-boundary** and **-bbox** options are mutually exclusive; use only one.

-parents *soft_macro_or_plan_group*

Specifies the parent plan group or soft macro object with which to associate the pin guide.
For virtual flat flow this will usually be a plan group. For hierarchical flow this will usually be a soft macro.
By default, the command creates the pin guide for the current cell.

-name *pin_guide_name*

Specifies the name of the pin guide to be created. If this option is not used a default name will be given to the pin guide.

objects

Specifies a collection of nets for a parent plan group or a collection of pins for a parent soft macro.

create_pin_guide

For a parent plan group, the terminals generated by pin assignment for these nets are constrained to the pin guide bounding box.

For a parent soft macro the terminals generated by pin assignment for these pins are constrained to the pin guide bounding box.

RETURNS

`pin_guide`
Specifies a created pin guide object.

DESCRIPTION

This command creates a pin guide for a plan group or soft macro to constrain terminals generated by pin assignment to a specified bounding box.

Pin guide shapes may be used to define »feedthroughs ..., that is, added ports that do not correspond to existing logical ports, to route a net through a plan group or soft macro. When used in this way, the collection of objects supplied to the command should consist only of nets.

If a parent block of the guide contains a connection to the net, and the guide crosses the block boundary more than once, a port is associated with each crossing. One of the ports will correspond to the original port. Any additional ports created will be »feedthrough ... ports.

If a parent block of the guide does not contain any connection to the net, then the pin guide must cross the block boundary in at least two separate locations. The net will be forced to route through this block and will have a »feedthrough port ... in each of the areas where the guide crosses the block boundary. If a guide only crosses a non-connected block in one place, it is considered an error and this portion of the guide will be ignored. The guide should be a single contiguous shape (i.e. not disjoint), and can be either rectangular or rectilinear.

The user should take care that the guide represents a reasonable path for the feedthrough routing. For any guide, the number of crossings of the block boundary must be less than or equal to the number of net targets outside the block. For example, if the guide is an irregular shape that crosses the block boundary in three disjoint areas, then there must be at least three separate targets (ports) on the net outside the block, so that each new feedthrough port can be connected to at least one external target. If there are fewer external targets, say two in this case, it is considered an error and this portion of the guide will be ignored.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a pin guide with the name abc for all nets matching a pattern on a plan group named *mem1*.

```
prompt> set pin_guide [create_pin_guide -bbox {0 0 100 100}\
```

```
-name abc \
-parents mem1 [get_nets *clk*]
```

The following example creates an L-shape pin guide for all nets matching a pattern on the plan group *mem1*.

```
prompt> set pin_guide [create_pin_guide -boundary \
{ {0 0} {100 0} {100, 30} {30 30} {30 100} {0 100} {0 0} } \
-parents mem1 [get_nets *clk*]
```

SEE ALSO

`get_pin_guides(2)`
`report_pin_guides(2)`

create_placement

Performs coarse placement on the current design.

SYNTAX

```
int create_placement
[-effort low | medium | high]
[-quick]
[-timing_driven]
[-congestion [-congestion_effort low | medium | high]]
[-check_only]
[-num_cpus number_of_cpus]
[-mpc]
[-ignore_scan]
```

Data Types

number_of_cpus integer

ARGUMENTS

-effort low | medium | high
Specifies the CPU effort level for coarse placement. The default effort level is **medium**.

-quick
Enables fast coarse placement suitable for floorplan exploration.

-timing_driven
Enables timing-driven placement mode.

-congestion
Enables congestion-driven placement mode.

-congestion_effort low | medium | high
Specifies the effort level for congestion mode. The default effort level is **medium**. Expect a significant increase in runtime for **high** effort. This option can only be used in conjunction with the **-congestion** option.

-check_only
Checks whether the design and the libraries have all of the necessary information to run the command. This option cannot be used with other options.

-num_cpus *number_of_cpus*
Specifies the number of CPUs used in parallel during coarse placement. The *number_of_cpus* is an integer value that is less than or equal to the number of free CPUs on your machine and greater than or equal to 1. If unspecified, the default is to use one CPU. Only one Galaxy-PSYN License is checked out. Note that only the core placement algorithm is multi-threaded. Other components of the **create_placement** command (design loading, timing, etc.) will still use only 1 CPU.

-mpc

Runs **create_placement** with minimum physical constraints. This option controls instructs the command to check for any floorplan in the design. If there is no floorplan, it creates a floorplan based on the minimum physical constraints. If you do not specify any physical constraints, the tool assumes a set of default values and creates a default floorplan based on the number of cells and the total areas needed. The default values are 60% cell density and 1:1 aspect ratio. The cell area information is taken from the physical cell library. Refer to the **set_mpc_options** command for details of how to set up physical constraints.

-ignore_scan

Ignores scan chain connections during placement.

DESCRIPTION

The **create_placement** command performs coarse placement on the current design.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example runs the **create_placement** command in timing-driven mode:

```
prompt> create_placement -effort high -timing_driven
```

SEE ALSO

```
legalize_placement(2)
psynopt(2)
read_def(2)
write_def(2)
```

create_placement_blockage

Creates a new placement blockage.

SYNTAX

```
status create_placement_blockage
-bbox rectangle
[-type {hard | soft | pin | hard_macro | partial}]
[-blocked_percentage percentage]
[-no_register]
[-blocked_layers layers]
[-name blockage_name]
```

Data Types

<i>rectangle</i>	x1 y1 x2 y2
<i>percentage</i>	integer
<i>layers</i>	string
<i>blockage_name</i>	string

ARGUMENTS

-bbox *rectangle*

Specifies the coordinates of the bounding box of the blockage.

-type {hard | soft | pin | hard_macro | partial}

Specifies the type of blockage to be created.

Valid values are:

- **hard** for hard blockage

With a hard blockage, the placer does not place any standard cells or hard macros in the specified region.

- **soft** for soft blockage

With a soft blockage, the placer tries not to place standard cells or hard macros in the specified region but will do so if the congestion is too high.

- **pin** for pin blockage

With a pin blockage, during pin assignment the global router does not route in the specified area and the pin placer does not assign pins in the specified area.

Note that when you create a pin blockage, you can also specify the blocked layers using the *-blocked_layers* option.

If this is not specified, it defaults to blocking all layers.

- **hard_macro** for hard macro blockage

With a hard_macro blockage, the placer places standard cells but not hard macros in the specified region.

- **partial** for partial blockage

For a partial blockage the amount of area used to place cell will be limited to the specified percent of the blockage area.

Note that when you create a partial blockage, you must also specify the blocked percentage value using the `-blocked_percentage` option.

The default value is **hard**.

-blocked_percentage *percentage*

Specifies the percentage blockage for a partial blockage.

This option can only be used with the **partial** blockage type.

-no_register

Restricts the coarse placer from placing any register cells within the specified blockage area.

Enable the **-no_register** option with hard, soft, and partial blockage types only. This option only affects partial blockages, as the coarse placer does not place any cells within the area specified by soft and hard blockages. Only coarse placer honors the attribute set by this option.

-blocked_layers *layers*

Specifies the layers for which routing to pins are blocked.

This option can only be used with the **pin** blockage type.

-name *blockage_name*

Specifies the optional name of the blockage. If you specify a name for the blockage, you can use it later in the flow to get the blockage by name.

DESCRIPTION

This command creates a new placement blockage, which is used to control the placement of cells in a specified rectangular when the placer is run.

Snapping of the bounding box is done automatically using global snap settings.

See the description of the **-type** option and the relevant placer documentation for more information.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a soft placement blockage.

```
prompt> create_placement_blockage -bbox {0 0 100 100} -type soft
```

`create_via(2)`

create_plan_groups

Creates instance plan groups in the design.

SYNTAX

```
int create_plan_groups
[-coordinate {coordinates_list}]
[-rectangle rectangle_area]
[-polygon {polygon_area}]
[-dimension {width height}]
[-target_aspect_ratio aspect_ratio]
[-target_utilization utilization]
[-is_fixed]
[-color range_0_to_63]
[-cycle_color]
logic_cell_list
```

Data Types

<i>coordinates_list</i>	list
<i>rectangle_area</i>	list
<i>polygon_area</i>	list
<i>aspect_ratio</i>	float
<i>utilization</i>	float
<i>range_0_to_63</i>	string
<i>logic_cell_list</i>	list

ARGUMENTS

-coordinate {coordinates_list}

Specifies the coordinates of a plan group. The areas in the list are rectangles that should overlap or adjoin. Each rectangle in the plan group is identified by its lower-left and upper-right coordinates. The format for each rectangle is $\{l1x1\ l1y1\ urx1\ ury1\}$. Substitute the defining points of the rectangles you want for *coordinates_list*. Every combination of $\{l1x1\ l1y1\ urx1\ ury1\}$ defines a target placement area for the objects. By default, this option is off. The coordinates are in microns relative to the chip origin.

-rectangle rectangle_area

Creates a rectangular plan group. Substitute the defining points of the rectangle you want for *rectangle_area*. A rectangle is identified by its lower-left and upper-right coordinates. The format is $\{l1x1\ l1y1\} \{urx1\ ury1\}$. By default, this option is off.

-polygon {polygon_area}

Creates a rectilinear plan group. Substitute the defining points of the polygon you want for *polygon_area*. A polygon is identified by specifying the coordinates of all its points. The format is $\{\{x1\ y1\} \{x2\ y2\} \dots\}$. By default, this option is off.

-dimension {width height}

Specifies the dimension of plan groups. Plan groups are put outside of the

core area. The numbers are in microns. By default, this option is off.

-target_aspect_ratio aspect_ratio
 Specifies the value the height to width aspect ratio. Together with the **-target_utilization** option, the real width and height is calculated out, and plan groups are put outside of the core area. The value of **aspect_ratio** is height divided by width . The default is **1.0**.

-target_utilization utilization
 Specifies the value of the plan group area size divided by the total of the area size of the cells. The default value is the average design utilization.

-is_fixed
 Specifies that the plan group is in a fixed location, and the shaping will ignore it. By default, this option is off.

-color range_0_to_63
 Specifies the plan group color. Substitute a value for **range_0_to_63** that is in the range of **0** to **63**, inclusive. The default is **no_color** which is the special value for no user specified color.

-cycle_color
 Allows the tool to automatically assign a color. By default, this option is off.

logic_cell_list
 Specifies hierarchy cell names or a collection returned by the **get_cells** command. Plan groups are created on all valid hierarchy cells in the list. Only one logic cell is allowed if you use the **-rectangle**, **-polygon**, or **-coordinate** option. The tool does not support nested plan groups, meaning logical nests, not geometry nests. That is, a plan group on top/module cannot be created if plan group on top/module/third already exists.
 The command returns an empty collection if no plan groups are successfully created by the given **logic_cell_list**. By default, this option is off.

DESCRIPTION

This command defines exclusive region-based placement constraints for coarse placement. Plan groups restrict the placement of cells to a specific region of the core area.

The tool guarantees that these cells are placed completely within the instance plan group. It never places cells that do not belong to the plan group inside it. Thus, the tool can is capable of converting the plan group to a soft macro later.

If you specify the **-rectangle**, **-polygon**, or **-coordinate** option, this command creates a plan group with an explicit location. If you specify the **-dimension** option it creates plan groups with the given bounding box and places them above the top of the core area.

If more than one placeable area is defined in the **-coordinate** option, the coarse placement engine can place cells in any of those areas. These placeable areas should overlap or adjoin. One application of this is to define a rectilinear plan group by breaking down the original rectilinear plan group into multiple rectangles, and

listing the defining coordinates of each rectangle in *coordinates_list*. The number of parameters in the list must be a multiple of 4.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The example creates a rectilinear plan group for a logic cell on *timer/decode0*. The rectilinear bound is created as a set of two rectangles defined by coordinates {{10 10} {30 20}} and {{20 20}{30 30}} with a common edge.

```
prompt> create_plan_groups \
-coordinate {10 10 30 20 20 20 30 30} timer/decode0
```

SEE ALSO

```
get_cells(2)
get_plan_groups(2)
remove_plan_groups(2)
```

create_port

Creates ports in the current design or its subdesign.

SYNTAX

```
status create_port
port_list
[-direction dir]
```

Data Types

<i>port_list</i>	list
<i>dir</i>	string

ARGUMENTS

<i>port_list</i>	Specifies names of ports created in the current design. Each port name must be unique within the current design.
<i>-direction dir</i>	Specifies the signal flow of the created port. The possible values are in , out , or inout . The default is in .

DESCRIPTION

The **create_port** command creates new port objects in the current design or its subdesign. The **create_port** command creates only scalar or single bit ports.

Ports are the external connection points on a design. To connect ports to nets inside a design, use **connect_net**. To remove ports from the current design, use **remove_port**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **create_port** to create ports in the current design:

```
prompt> current_design
Current design is 'TOP'.
{ "TOP" }

prompt> create_port -direction "in" {A1 A2 A3 A4}
Creating port 'A1' in design 'TOP'.
Creating port 'A2' in design 'TOP'.
```

```
Creating port 'A3' in design 'TOP'.
Creating port 'A4' in design 'TOP'.
1
```

```
prompt> get_ports *
{A1 A2 A3 A4}
```

The following example uses **create_port** to create ports in the MID subdesign. U1 is an unique instance of design MID.

```
prompt> current_design
Current design is 'TOP'.
{"TOP"}

prompt> create_port -direction "in" {U1/A1 U1/A2 U1/A3 U1/A4}
Creating port 'A1' in design 'MID'.
Creating port 'A2' in design 'MID'.
Creating port 'A3' in design 'MID'.
Creating port 'A4' in design 'MID'.
1

prompt> get_pins U1/*
{U1/A1 U1/A2 U1/A3 U1/A4}
```

create_port command create ports in the design 'MID'. When you want to verify the ports are created, you use **get_pins** on the pins of instance of the design MID to get them.

create_power_domain

Creates a power domain, which provides a power supply distribution network.

SYNTAX

Syntax for UPF Mode

```
string create_power_domain
domain_name
[-elements list]
[-include_scope]
[-scope instance_name]
```

Syntax for Non-UPF Mode

```
status create_power_domain
domain_name
[-power_down]
[-power_down_ctrl object_list]
[-power_down_ack object_list]
[-object_list object_list]
```

Data Types

domain_name string

Data Types for UPF Mode

list list instance_name string

Data Types for Non-UPF Mode

object_list list

ARGUMENTS

domain_name

UPF Mode

Specifies the name of the power domain to be created. The name should be a simple (non-hierarchical) name.

The power domain cannot be created if there is a power domain with the same name in the specified scope or if there is a hierarchical or leaf cell instance or port with the same name in the specified scope.

Non-UPF Mode

Specifies the name of the new power domain to be created.

-elements collection

Specifies a collection of hierarchical cells that are added as an extent of the power domain. Specified cells cannot be added in other power domains of the same scope.

If you do not use either the **-elements** or the **-include_scope** option, the power domain consists of the current scope and any of its children not specified as elements in another **create_power_domain** command.

-include_scope

Includes the scope of the power domain in the extent of the power domain. This means all elements within the current scope get the same supply as the power domain, but they are not explicitly added to it.

-scope instance_name

Specifies in which scope the power domain is to be created. The instance name is the name of a hierarchical cell.

By default, the power domain is created in the current scope.

-power_down

Specifies that the new power domain is a power-down domain. You must use this option (switch) if you use the **-power_down_ctrl** option.

-power_down_ctrl object_list

Specifies the power-down control net for the new power domain. If you use this option you must also use the **-power_down** option.

-power_down_ack object_list

Specifies the power-down acknowledge net for the new power domain. If you use this option you must also use the **-power_down_ctrl** option.

-object_list object_list

Specifies a list of hierarchical cells that are associated with the new power domain. For each design, there can be only one top-level domain. Each hierarchical cell can be associated with only one power domain. By default, the new power domain is assumed to be the top-level domain.

DESCRIPTION

UPF Mode

This command creates a power domain in the specified scope. A power_domain is a collection of design elements that share a primary power and ground power net. The logic hierarchy level where a power domain is created is called the scope of the power domain. The set of design elements that belong to a power domain are called the "extent" of that power domain. A hierarchical cell is an example of an element. Although a design element can be in the scope of several power domains, it can be in the extent of only one power domain.

A power domain can have several supply nets, which are connected to a power domain

via a supply port. A power switch of a power_domain can be used to turn on and off the power supply of part or all of the power domain. You can create a supply net, supply port, and power switch by using the **create_supply_net**, **create_supply_port** and **create_power_switch**, respectively.

When this command succeeds, it returns the full name of the power domain (from the current scope). When it fails, it returns a null string.

Non-UPF Mode

This command creates a new power domain for the current design. The power domains for each design must be uniquely named. There can be only one top-level power domain in a design. The tool creates an always-on power domain.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

UPF Mode

The following example creates two power domains in the scope named INST1.

```
prompt> create_power_domain PD1 -elements INST1/SUB_INST -scope INST1
INST1/PD1
prompt> create_power_domain PD2 -elements INST1/SUB_INST -scope INST1
Error: Could not add cell 'INST1/SUB_INST' to power domain 'PD2'.
(MWUI-402)
prompt> create_power_domain PD2 -scope INST1 -include_scope
INST1/PD2
```

Non-UPF Mode

The following example creates a top-level power domain.

```
prompt> create_power_domain TOP_DOMAIN
```

The following example creates a lower-level power domain.

```
prompt> create_power_domain SUB_DOMAIN -power_down \
-power_down_ctrl [get_nets pd_ctrl] \
-power_down_ack [get_nets pd_ack] \
-object_list [get_cells mid1]
1
```

SEE ALSO

`remove_power_domain(2)`
`report_power_domain(2)`

create_power_net_info

Creates a power net.

SYNTAX

```
status create_power_net_info
power_net_name
-power | -gnd
[-switchable]
[-nominal_voltages nominal_voltage_list]
[-voltage_ranges voltage_range_list]
```

Data Types

<i>power_net_name</i>	string
<i>nominal_voltage_list</i>	list
<i>voltage_range_list</i>	list

ARGUMENTS

power_net_name

Specifies the name of the new power net information to be created.

-power

Specifies that the type of the new power net is "power". This option is mutually exclusive with the **-gnd** option.

-gnd

Specifies that the type of the new power net is "gnd". This option is mutually exclusive with the **-power** option.

-switchable

Specifies that the power net can be cut off externally, or, if driven by an internal switch, cut off internally. This option can only be used with **-power**.

-nominal_voltages nominal_voltage_list

Specifies the list of nominal voltages that the power net has been designed to operate. The actual operating voltage of the power net can deviate from the nominal within a certain tolerance as specified by *voltage_range_list*. This option must be specified when using the **-voltage_ranges** option. This option can only be used with **-power**.

-voltage_ranges voltage_range_list

Specifies the list of allowed voltage ranges around the nominal voltages that this power net has been designed to operate. This option must be specified when using the **-nominal voltages** option. This option can only be used with **-power**.

DESCRIPTION

The **create_power_net_info** command creates new power net information for the current

design. The power net is either of type **power** or of type **gnd**.

EXAMPLES

The following examples use the command to create power nets:

```
prompt> create_power_net_info VSS_net -gnd  
1  
  
prompt> create_power_net_info VDD1_net -power  
1  
  
prompt> create_power_net_info VDD2_net -power \  
      -switchable -nominal_voltages {0.9 1.08} \  
      -voltage_ranges {0.88 0.92 1.05 1.10}  
1
```

<i>int</i>	integer
<i>collection_of_cells</i>	collection

ARGUMENTS

-nets *collection_of_nets*

Specifies nets on which to create straps. You must specify at least one power or ground net. If you specify more than one value, separate the values with a space. This is a required option, unless you specify the **?undo** option.

-undo

Removes straps created by the last **create_power_straps** run. If you specify this option, it supersedes all other options.

-direction horizontal | vertical

Specifies the strap direction. Valid values are horizontal and vertical. The default is horizontal.

-start_at *distance*

Specifies the starting strap coordinate. The unit for the distance value is the unit specified in the technology file.

For a horizontal strap, this is the y-coordinate. For a vertical strap, this is the x-coordinate. The default is 0.0.

-layer *number_or_name*

Specifies the metal layer on which to create straps. The value can be specified either as the layerNumber or maskName from the technology file. The default is to select the first layer for the specified direction.

-width *distance*

Specifies the strap width. The unit for the distance value is the unit specified in the technology file. The default is the width of the layer.

-configure groups_and_step | groups_and_stop | step_and_stop | rows | macros | groups_and_stop | step_and_stop | rows | macros

Specifies the strap configuration. Valid values are the following:

- **groups_and_step** (default) - Places straps based on the number of groups specified by the **-num_groups** option and the spacing specified by the **-step** option.

- **groups_and_stop** - Places straps based on the number of groups specified by the **-num_groups** option and the stop point specified by the **-stop** option. The tool uses this information to determine the strap spacing.
 - **step_and_stop** - Places straps based on the spacing specified by the **-step** option and the stop point specified by the **-stop** option. The tool uses this information to determine the number of groups.
 - **rows** - Creates straps over the standard cell areas. The tool automatically determines the strap locations.
 - **macros** - Creates straps over the macro cell pins. The tool automatically determines the strap locations.
- You can specify only one of these configurations.

-num_groups int

Specifies the number of strap groups to create. Do not use this option if you are using the **step_and_stop** configuration. The default is 1.

-step distance

Specifies the distance from the reference strap of one group to the reference strap of an adjacent group. The unit for the distance value is the unit specified in the technology file.

For vertical straps, specifying a positive value places the next strap in the group to the right of the current strap and specifying a negative value places the next strap to the left of the current strap. For horizontal straps, specifying a positive value places the next strap above the current strap and specifying a negative value places the next strap below the current strap. The default is 0.0. Do not use this option if you are using the **groups_and_stop** configuration.

-stop distance

Specifies the location where strap placement is to stop. The unit for the distance value is the unit specified in the technology file. The default is 0.0. Do not use this option if you are using the **groups_and_step** configuration.

-pitch_within_group distance

Specifies the distance to place between the center lines of two adjacent straps in the same group. The unit for the distance value is the unit specified in the technology file.

If the straps run vertically, specifying a positive value places the next strap to the right of the first and specifying a negative value places the next strap to the left of the first. If the straps run horizontally, specifying a positive value places the next strap above the first and a negative value places the next strap below the first. The default is the pitch of the layer defined in the technology file.

-start_low_ends boundary | first_targets | coordinate | last_targets | first_targets | coordinate | last_targets

Specifies the location for the low strap ends. Valid arguments are

- **boundary** (default) - Places the low end of the strap at the core boundary.
- **first_targets** - Places the low end of the strap at the first target on the same net. For horizontal straps, this is the first target found by moving

left from the initial strap. For vertical straps, this is the first target found by moving down from the initial strap.

- **coordinate** - Places the low end of the strap at the coordinate specified by the **-start_low_ends_coordinate** option.

- **last_targets** - Places the low end of the strap at the last target on the same net. For horizontal straps, this is the leftmost target. For vertical straps, this is the lowest target.

You can specify only one of these values.

-start_low_ends_coordinate distance

Specifies the coordinate for the low end of the strap when using **-start_low_ends_coordinate**. The unit for the distance value is the unit specified in the technology file. For horizontal straps, this is the x-coordinate. For vertical straps, this is the y-coordinate. The default is 0.0.

-start_high_ends boundary | first_targets | coordinate | last_targets | first_targets | coordinate | last_targets

Specifies the location for the high strap ends. Valid arguments are

- **boundary** (default) - Places the high end of the strap at the core boundary.

- **first_targets** - Places the high end of the strap at the first target on the same net. For horizontal straps, this is the first target found by moving right from the initial strap. For vertical straps, this is the first target found by moving up from the initial strap.

- **coordinate** - Places the high end of the strap at the coordinate specified by the **-start_high_ends_coordinate** option.

- **last_targets** - Places the high end of the strap at the last target on the same net. For horizontal straps, this is the rightmost target. For vertical straps, this is the highest target.

You can specify only one of these values.

-start_high_ends_coordinate distance

Specifies the coordinate for the high end of the strap when using **-start_high_ends_coordinate**. The unit for the distance value is the unit specified in the technology file. For horizontal straps, this is the x-coordinate. For vertical straps, this is the y-coordinate. The default is 0.0.

-extend_low_ends to_first_target | to_boundary_and_generate_pins | force_to_boundary_and_generate_pins | off | to_boundary_and_generate_pins | force_to_boundary_and_generate_pins | off

Specifies how to extend straps from the low end. Valid values are

- **to_first_target** (default) - Extends the straps from the low end until the strap reaches the first target on the same net.

- **to_boundary_and_generate_pins** - Extends the straps from the low end until the strap reaches the core boundary and then generates a pin. The strap stops when it reaches the first target on the same net.

- **force_to_boundary_and_generate_pins** - Extends the straps from the low end until the strap reaches the core boundary and then generates a pin. The strap does not stop when it reaches the first target on the same net.

- **off** - Does not extend the straps from the low end.
You can specify only one of these values.

`-extend_high_ends to_first_target | to_boundary_and_generate_pins | force_to_boundary_and_generate_pins | off | to_boundary_and_generate_pins | force_to_boundary_and_generate_pins | off`

Specifies how to extend straps from the high end. Valid values are

- **to_first_target** (default) Extends the straps from the high end until the strap reaches the first target on the same net.

- **to_boundary_and_generate_pins** - Extends the straps from the high end until the strap reaches the core boundary and then generates a pin. The strap stops when it reaches the first target on the same net.

- **force_to_boundary_and_generate_pins** - Extends the straps from the high end until the strap reaches the core boundary and then generates a pin. The strap does not stop when it reaches the first target on the same net.

- **off** - Does not extend the straps from the high end.
You can specify only one of these values.

`-num_placement_strap int`

Specifies the number of times strap groups are to be placed. Valid values are greater than or equal to 1. The default is 1.

`-increment_x_or_y distance`

Specifies the distance between the first strap and subsequent straps when the **-num_placement_strap** option is greater than 1. The unit for the distance value is the unit specified in the technology file. For horizontal straps, this is the y-distance. For vertical straps, this is the x-distance. The default is 0.0.

`-special_via_rule`

Creates a matrix of small via arrays instead of one large via array at wire intersections. Using smaller via arrays could free some routing space. You specify the x- and y-offsets, x- and y-size, and x- and y- step values by using the special via options described below. If the specified values violate design rules, vias are not created.

`-special_via_x_offset distance`

Specifies the x-offset from the lower-left corner of the wire intersection area where you want to create the first special via. The unit for the distance value is the unit specified in the technology file. The default is 0.0.

`-special_via_y_offset distance`

Specifies the y-offset from the lower-left corner of the wire intersection area where you want to create the first special via. The unit for the distance value is the unit specified in the technology file. The default is 0.0.

-offset_both_sides_for_special_via
Applies the x- and y-offsets to both lower-left and upper-right corner of the wire intersection area. By default, the offsets are applied only to the lower-left corner of the wire intersection area.

-special_via_x_size distance
Specifies the horizontal size of the special via arrays. The unit for the distance value is the unit specified in the technology file. The default is 0.0.

-special_via_y_size distance
Specifies the vertical size of the special via arrays. The unit for the distance value is the unit specified in the technology file. The default is 0.0.

-special_via_x_step distance
Specifies the horizontal distance between the left sides of adjacent via arrays. The unit for the distance value is the unit specified in the technology file. The default is 0.0.
A via is not created if it would violate DRC violations.

-special_via_y_step distance
Specifies the vertical distance between the bottom sides of adjacent via arrays. The unit for the distance value is the unit specified in the technology file. The default is 0.0. A via is not created if it would violate DRC violations.

-advanced_via_rules
Uses advanced via rules that have been previously set by the **set_preroute_advanced_via_rule** command.

-special_rules string
Uses special rules specified by the **set_preroute_special_rules** command. You must enter the string exactly as it was specified in the **?name** option of **set_preroute_special_rules**.

-look_inside_std_cells
Creates vias to connect straps to pins inside standard cells. By default, straps are not connected to pins inside standard cells.

-std_cells collection_of_cells
Specifies the standard cells to consider when connecting the straps. If *collection_of_cells* is not empty, the **-look_inside_std_cells** option is turned on automatically, and only pins of the specified cells are considered as targets for the straps.
If this option is omitted or the collection is empty, either all standard cells or none of them are considered, depending on whether the **-look_inside_std_cells** option is used.

-keep_floating_wire_pieces
Keeps extra wire pieces that are not connected to other wires.

-ignore_cell_boundary
Keeps out-of-bound straps.

-clip_at_top_cell_boundaries
 Cuts straps at the top cell boundaries. This is useful to create straps within the boundaries of a rectilinear design.

-do_not_merge_targets
 Disables merging of target objects before creating connections.

-optimize_wire_locations
 Saves more tracks for detail routing by adjusting the created straps by small distances horizontally or vertically.

-ignore_parallel_targets
 Does not connect parallel targets. By default, parallel targets are defined by their x- and y-dimensions. A target is parallel to a horizontal strap if its x-dimension is greater than or equal to its y-dimension. A target is parallel to a vertical strap if its y-dimension is greater than or equal to its x-dimension.

-define_parallel_targets_by_wire_directions
 Defines parallel targets by their wire directions. A target is parallel to a horizontal strap if its wires are horizontal. A target is parallel to a vertical strap if its wires are vertical. By default, parallel targets are defined by their x- and y-dimensions.

-do_not_route_over_macros
 Prevents the prerouter from generating wires over macro cells. If you use this option, the tool removes the parts of a strap that go over a macro.

-extend_for_multiple_connections
 Extends the low and high ends of a strap to connect more targets on the same net. The extension continues until either there are no more targets in the respective direction or the next target exceeds the spacing threshold specified by the **-extension_gap** option.

-extension_gap *distance*
 Connects adjacent targets that are closer than the *distance* value. The unit for the distance value is the unit specified in the technology file. This value is the space threshold for multiple connections.

-mark_as_std_cell_pin_connections
 Marks the created power or ground straps as the "pg_std_cell_pin_conn" type. By default, they created are marked as the "pg_strap" type. This option is mutually exclusive with the **-mark_as_ring** option.

-mark_as_ring
 Marks the created power or ground straps as the "pg_ring" type. By default, they created are marked as the "pg_strap" type. This option is mutually exclusive with the **-mark_as_std_cell_pin_connections** option.

-num_cpu *int*
 Uses distributed routing on the specified number of CPUs to speed up the routing process. This option can speed up the routing process significantly for large cases.
 To use distributed routing, you must set up the distributed routing network by using the **set_distributed_route** command before running the

create_power_straps command. The number of CPUs specified in this option should not exceed the number of CPUs defined in the distributed routing setup. The default is 0 (distributed routing is not used).

DESCRIPTION

This command creates power straps in a design. Use a few wide straps rather than many thin straps to improve the placement quality and decrease the placement runtime. This command can automatically connect the straps to the closest power or ground ring at, or beyond, both ends of the straps. All pins generated by prerouting commands are marked as fixed to prevent the **create_power_straps** command from moving them during other operations. You can use the **set_preroute_drc_strategy** command to change the internal application of DRC rules.

Note: You must use the **derive_pg_connection** command to create the port-to-net connections for power and ground nets that are not in the netlist.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows how to create 7 vertical power straps for the VDDC and VSSC nets on the M3 layer with a width of 5 uu. The first strap starts at x-coordinate 530. There is a spacing of 100 uu between straps. The low ends start at the y-coordinate 280. The high ends end at y-coordinate 980. The straps extend for multiple connections in the radius of 1000 uu.

```
prompt> create_power_straps\
-nets {VDDC VSSC}\"
-direction vertical\
-layer M3\
-width 5\
-start_at 530\
-num_placement_strap 7\
-increment_x_or_y 100\
-start_low_ends_coordinate\
-start_low_ends_coordinate 280.0\
-start_high_ends_coordinate\
-start_high_ends_coordinate 980.0\
-extend_for_multiple_connections\
-extension_gap 1000
```

The following example shows how to create power straps configured by placement rows following the set of special rules named "specGS".

```
prompt> create_power_straps\
-nets {VSS VDD}\"
-configure_rows\
```

```
-direction horizontal\  
-layer PM\  
-width 8.0\  
-pitch_within_group 10.08\  
-step 20.16\  
-extend_low_ends_to_first_target\  
-extend_high_ends_to_first_target\  
-keep_floating_wire_pieces\  
-ignore_parallel_targets\  
-special_rules specGS
```

For more information about special rules, see the **set_preroute_special_rules** man page.

The following example shows how to create power straps configured by macro cell pins following the set of special rules named "specLMVmem".

```
prompt> create_power_straps\  
-nets {VDD VSS}\  
-configure_macros\  
-direction vertical\  
-layer M4\  
-advanced_via_rules\  
-extend_low_ends off\  
-extend_high_ends off\  
-special_rules specLMVmem
```

For more information about special rules, see the **set_preroute_special_rules** man page.

create_power_switch

Creates a power switch at the specified power domain. This command is supported only in UPF mode.

SYNTAX

```
string create_power_switch
switch_name
-domain domain_name
-output_supply_port {port_name supply_net_name}
-input_supply_port {port_name supply_net_name}
-control_port {port_name net_name}
[-ack_port {port_name net_name [{boolean_function}]}]
[-ack_delay {port_name delay}]
-on_state {state_name input_supply_port {boolean_function}}
[-off_state {state_name {boolean_function}}]
```

Data Types

switch_name	string
domain_name	string
port_name	string
supply_net_name	string
net_name	string
boolean_function	list
delay	string
state_name	string
input_supply_port	string

ARGUMENTS

```
switch_name
    Specifies the name of the power switch to be created. The name should be a simple (non-hierarchical) name. If a power switch already exists with the same name in the specified power domain, the power switch cannot be created. This option is required.

-domain domain_name
    Specifies which power domain contains the power switch. If the power domain with the specified name does not exist in the current scope, the command fails.
    This option is required.

-output_supply_port {port_name supply_net_name}
    Specifies the name of the output port of the power switch and the supply net where the port connects. If a port exists with the same name on the power switch, the command fails. If there is no supply net with the same name in the current scope, the command fails.
    This option is required.

-input_supply_port {port_name supply_net_name}
    Specifies the name of the input port of the power switch and the supply net
```

where the port connects. If a port exists with the same name on the power switch, the command fails. If there is no supply net with the same name in the current scope, the command fails.

This option is required and can be specified more than once. One power switch can have multiple input supply ports.

-control_port {port_name net_name}

Specifies the name of the control port of the power switch and the logical net where this port connects. If a port with the specified name already exists on the power switch, the command fails. If a net with the specified name does not exist, the command fails.

This option is required and can be specified more than once. One power switch can have multiple control ports.

-ack_port {port_name net_name [{boolean_function}]}

Specifies the name of the acknowledge port of the power switch and the logical net where this port connects. If a port with the specified name already exists on the power switch, the command fails. If a net with the specified name does not exist, the command fails.

If this option is not specified, the power switch will not have an acknowledge port. Optionally, a Boolean function can also be specified.

This option can be specified multiple times.

-ack_delay {port_name delay}

Specifies the acknowledge port on the switch and the corresponding acknowledge delay.

This option can be specified multiple times.

-on_state {state_name input_supply_port {boolean_function}}

Specifies a named on state, the relevant input supply port, and its Boolean function.

This option can be specified multiple times.

-off_state {state_name {boolean_function}}

Specifies a named off state and its relevant Boolean function.

This option can be specified multiple times.

DESCRIPTION

The *create_power_switch* command enables you to create a power switch at the specified power domain. The switch is created within the scope of the power domain. Each power switch must be connected with an input supply net and an output supply net. The power switch can be connected with an acknowledge logical net and several control logical nets. Each net is connected with a power switch via a switch port. The switch ports are automatically created if the power switch is created successfully.

This command returns the full name of the power switch (from the current scope) upon success and the command returns a null string upon failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates power switch SW1 within power domain PD1:

```
prompt> create_power_switch SW1 -domain PD1 \
      -output_supply_port {vout VNO2} \
      -input_supply_port {vin1 VNI1} \
      -input_supply_port {vin2 VNI2} \
      -control_port {ctrl_small ON1} \
      -control_port {ctrl_large ON2} \
      -ack_port {ack_p ACKN {ctrl_small & !ctrl_large}} \
      -ack_delay {ack_p 1} \
      -on_state {full_s vin1 {ctr_small}} \
      -off_state {off_s {!ctr_small}}
```

SEE ALSO

```
remove_power_switch(2)
report_power_switch(2)
```

create_power_switch_array

Adds header/footer cells into the design in an array pattern.

SYNTAX

```
status create_power_switch_array
-lib_cell lib_cell_or_power_switch
[-voltage_area voltage_area]
[-bounding_box rectangle]
[-relative_to_voltage_area]
[-design hierarchy_name]
-x_increment dx
-y_increment dy
[-start_row index]
[-start_column index]
[-snap_to_row_and_tile]
[-orientation {N | W | S | E | FN | FE | FS | FW}]
[-respect list]
[-pattern normal | staggered]
[-prefix prefix_name]
```

Data Types

<i>lib_cell_or_power_switch</i>	collection or list of one item
<i>voltage_area</i>	collection or list of one item
<i>hierarchy_name</i>	string
<i>dx</i>	float
<i>dy</i>	float
<i>index</i>	integer
<i>prefix_name</i>	string

ARGUMENTS

-lib_cell lib_cell_or_power_switch

This is a required option giving lib cell to be used as header/footer cell. Use lib cell for non-UPF mode, and use power switch for UPF mode. It's a required option. If user uses lib cell name for UPF mode, switch cells can also be placed correctly, but PG pin connection may not be derived automatically by derive_pg_connection.

[-voltage_area voltage_area]

This is an optional option, defining a voltage area in which *lib_cell* cells will be placed. By default, this option is off. If this is not specified, the top level is assumed.

If -voltage_area given, and -design not given, find a logic hierarchy that match the voltage area and insert switch cells there. If -voltage_area and -design both given, the consistency will be checked. If -design given and -voltage_area not given, always go to the specified logic hierarchy.

Use voltage area for non-UPF mode, and use power domain for UPF mode.

[-bounding_box rectangle]

This is an optional option defining the bounding box (in microns) of the grid

to be considered. If both -voltage_area and -bounding_box are specified, header/footer cells will be added to the intersecting region of the given bounding box and voltage area.

[-relative_to_voltage_area]

This is an optional option that indicates the specified bounding box coordinates are relative to the lower left corner of the voltage area's bounding box. This option only works with -voltage_area option. By default, this option is off, meaning the specified bounding box coordinates are relative to the design's origin. If this option is specified without -voltage_area, it is ignored.

[-design *hierarchy_name*]

This is an optional option, which tells the tool where to insert the header/footer cells in the logical hierarchy. By default, this option is off, meaning that the cells are to be inserted at the top level of the design.

-x_increment *dx*

This is a required option that defines the step in the x direction. The unit for the distance *dx* is micron.

-y_increment *dy*

This is a required option that defines the step in the y direction. The unit for the distance *dy* is micron.

[-start_row *index*]

This is an optional option. When a header/footer cell is created and placed on a certain grid point, the index of the row this grid point is located in is added to the cell instance's name. User can use this option to control the index of the first row. The default value is 0.

[-start_column *index*]

This is an optional option. When a header/footer cell is created and placed on a certain grid point, the index of the column this grid point is located in is added to the cell instance's name. User can use this option to control the index of the first column. The default value is 0.

[-snap_to_row_and_tile]

This is an optional option that will cause the grid to snap to row and tile. This includes the bounding box as well as the x and y increments. This option only applies to standard cells, and it will cause that cells be placed in legal orientations allowed by the rows. Note that this means the -orientation option is not strictly followed. By default, this option is off.

[-orientation {N | W | S | E | FN | FE | FS | FW}]

Specifies the orientation of the placement of the header or footer cells. The valid values are **N**, **W**, **S**, **E**, **FN**, **FE**, , and **FW**. The default orientation is **N**. Note that this orientation may not be respected if the -snap_to_row_and_tile option is used. In this case, the orientation will apply to the cell only when it is legal for the row that a cell is in.

[-respect *list*]

This is an optional option, defining what type of objects will be avoided by header/footer cell placement. In other words, these objects will cut out nodes in the insertion grid. The value can be the combination of the following

choices: hard_blockage, soft_blockage, blockage, macro, fixed_cells, and all. By default, this option is off, and the header/footer cell placement will not honor any placement blockage or macro.

[-pattern normal | staggered]

This is an optional option. The normal behavior is to add an *reference_library* cell on every point of the insertion grid. The staggered option will cause insertion to skip alternating grid points. The default is normal.

[-prefix *prefix_name*]

This is an optional option. It specifies a name prefix for all the header/footer cells inserted. Without this option, the default prefix is *headerfooter<num>* where <num> is a unique number. Thus the default names of the inserted cells will be *headerfooter<num>_reference_library_cell_nameR<row_num>C<column_num>*. This allows user to do pattern matching to select cells on a row or column basis. Note that a row numbers (column numbers) may not be the same for all cells with same y location (x location). For example, using the -respect option, the grid will be cut out at blockages and macros. This will cause a new row or column number to be used.

DESCRIPTION

This command inserts cells of master *reference_library_cell* onto locations specified by the -bound_box, -x_increment, and -y_increment options. The insertion will be such that the lower left corner of cells will be on the grid points. If the grid does not align to min-grid (i.e., placed cells would not be on min-grid), then the grid will be automatically minimally adjusted so as to be on min-grid. Min-grid is the lithography grid. If the -snap_to_row_and_tile option is used, and the master cell *reference_library_cell* is a std cell, then the grid will be automatically adjusted so as to be on appropriate row sites. A message will be printed notifying user of this change. However, this command does not guarantee that placed cells will be legal. If legalization is desired, the user can specify the grid such that cells will be placed in legal locations or the user can run the legalizer after this command. The inserted cells will be marked as fixed placed.

This command will respect both the grid defined and the -voltage_area *voltage_area_name*. In other words, if a grid is partially in and out of *voltage_area_name*, then the cells will be placed inside *voltage_area_name* only. Another example is that if there is no -voltage_area option, then cells would be placed at the top level only.

After insertion, user can use *remove_cell* command to remove the switch cells.

EXAMPLES

The following example is to create and place header/footer cells using cell master "GSWITCH" in voltage area "INST". The cells are to be placed on a grid whose Y step is 8 microns X step is 40 microns. The new cell instances created by this command will have prefix "INSTHF" in their names.

```
prompt> create_power_switch_array\
```

```
-lib_cell "GSWITCH"\n-y_increment 8 -x_increment 40\n-voltage_area "INST"\n-prefix "INSTHF"
```

The following example is similar to the previous example, but it will only add cells to the intersection of voltage area "INST" and the specified bounding box area.

```
prompt> create_power_switch_array\n-lib_cell "GSWITCH"\n-bounding_box {110 200 250 400}\n-y_increment 8 -x_increment 40\n-voltage_area "INST" -prefix "INSTHF"
```

The following example is to add header/footer cells using cell master "GSWITCH" at the top level outside of any voltage area and within the specified bounding box, and the row and column index will start from 10 and 20, respectively.

```
prompt> create_power_switch_array\n-lib_cell "GSWITCH"\n-bounding_box {110 200 250 400}\n-y_increment 8 -x_increment 40\n-start_row 10 -start_column 20\n-prefix "INSTHF"
```

For UPF mode, the name of the power switch in the logic design relative to the current scope. if current scope is "TOP", there is a power switch "PS_A" under scope "SC_A" and "SC_A" is under scope "TOP".

```
prompt> create_power_switch_array\n-lib_cell "SC_A/PS_A"\n-bounding_box {110 200 250 400}\n-y_increment 8 -x_increment 40\n-start_row 10 -start_column 20 -prefix "INSTHF"
```

SEE ALSO

remove_cell(2)

create_power_switch_ring

Creates multithreshold-CMOS cells around a voltage area or a macro, in a ring pattern, either full ring or part of ring. If the pattern is part of ring, specify the start point and end point on the boundary. The switch cells will be placed anti-clockwise.

SYNTAX

```
status create_power_switch_ring
-switch_lib_cell lib_cells_or_power_switches
[-outer_corner_lib_cell outer_corner_lib_cell_name]
[-inner_corner_lib_cell inner_corner_lib_cell_name]
[-area_obj voltage_area_or_macro]
[-design hierarchy_name]
[-prefix string]
[-switch_orientation N | W | S | E | FN | FE | FS | FW]
[-outer_corner_orientation N | W | S | E | FN | FE | FS | FW]
[-inner_corner_orientation N | W | S | E | FN | FE | FS | FW]
[-density float]
[-offset {f1 f2...}]
[-start_point {x_y}]
[-end_point {x_y}]
[-check_overlap]
[-filler_lib_cell {pattern}]
```

ARGUMENTS

-switch_lib_cell *lib_cells_or_power_switches*

This is a required argument. Specify the library cell to be used as the switch cell. In the UPF mode specify the power switch or the library cell. If you specify the library cell in the UPF mode, though the switch cells are placed correctly the power and ground connections might not be derived automatically by the derive_pg_connection command.

In the non-UPF mode specify the library cell.

-outer_corner_lib_cell *outer_corner_lib_cell_name*

Specify a singleton collection that contains a corner cell to be placed at an outer (convex) corner of the switch cell ring. Outer corner cell insertion is skipped if you do not specify this option. A rectangle has outer corner only.

-inner_corner_lib_cell *inner_corner_lib_cell_name*

Specify a singleton collection that contains a corner cell to be placed at an inner (concave) corner of the switch cell ring. Inner corner cell insertion is skipped if you do not specify this option.

-area_obj *voltage_area_or_macro*

Specify the voltage area or macro around which the ring of switch cells is to be created. If you specify a voltage area with this option, use the power domain name in the UPF mode. If this option is not specified, the switch cells are created around the default voltage area.

-design *hierarchy_name*
 Specifies the hierarchy name under which the header or footer is inserted. If this option is not specified, a) For voltage area, the command finds a logic hierarchy that matches the voltage area and inserts the cells. b) For macro, the command inserts the cells under the top level. NOTE: If power switches are inserted around voltage area and under the top level, use "-design .".

-prefix *string*
 Specify a name prefix for all cells inserted by this command. Without this option, the default prefix is RINGMTCMOS. The name of the inserted switch cell is *prefix_SWITCH_<num>_refLibCellName* where *num* is an incremental unique integer. Filler cells and corner cells have similar naming convention, *prefix_FILLER_<num>_refLibCellName* and *prefix_CORNER_<num>_refLibCellName*.

-switch_orientation N | W | S | E | FN | FE | FS | FW
 Specify the orientation of the switch cells placed on the bottom edge of the ring. The default orientation is N.

N	rotate 0
W	rotate 90
S	rotate 180
E	rotate 270
FN	rotate 0 and mirror X
FS	rotate 0 and mirror Y
FW	rotate 90 and mirror X
FE	rotate 90 and mirror Y

-outer_corner_orientation N | W | S | E | FN | FE | FS | FW
 Specify the orientation of the outer corner cells placed on the bottom left corner (bottom left corner should always be a outer corner). Default orientation is N.

-inner_corner_orientation N | W | S | E | FN | FE | FS | FW
 Specify the orientation of inner corner cells placed on the corner which is very similar to the outer corner cells except it is a concave corner. This is illustrated by the following graph.

-density *float*
 Specify a float between 0.0 and 1.0 to indicate the multithreshold-CMOS power switch cell density of the ring. The default is 1.0. Higher density implies more switch cells to be inserted.

-offset -offset *f* or -offset {*f1 f2...*}
 Define additional distance to shrink or enlarge the boundary of the ring with respect to the voltage area or macro boundary. The unit is micron and the default offset is 0. A positive or negative value can be specified. Offset adjustment must maintain the relative shape of the boundary; otherwise an

error is issued. Positive offset value implies enlarging the boundary. If only one value is specified, the value is applied to all edges. If only two values are specified, the first value is considered as horizontal value and the second as vertical value. To specify a different offset value for a different edge, a set of values can be specified. If more than two values are specified, they must match the number of edges of the ring. The first edge is the horizontal edge with the smallest Y coordinate followed by the smallest X coordinate; followed by the second edge, in a counter clockwise traversal.

-start_point {x_y}

Specify the start point of the ring. The start point must be on the boundary edges of the given polygon. If -offset option is specified, the polygon boundary should be the shrunk or enlarged. By default, the start point of the ring is the left-most and bottom-most point of given polygon.

-end_point {x_y}

Specify the end point of the ring. If -offset option is specified, the polygon boundary should be the shrunk or enlarged. The end point must be on the boundary edge of the given polygon. By specifying this option, you can define a segment ring. By default, the ring is the entire boundary of the given polygon.

-check_overlap

Specify to check the overlap of the ring. When you specify this option the tool checks if any inserted power switch cells, filler cells, or corner cells in the ring overlaps with other objects. If an overlap is found, the tool issues warning messages. By default, the command does not check overlapping of the ring.

DESCRIPTION

This command performs ring-based multithreshold-CMOS cell insertion using the specified options. The command creates a ring consisting of switch cells with optional filler cells and corner cells. The ring is constructed around the given voltage area or macro. The number of switch cells inserted is controlled by the density option. The switch ring, filler and corner cells are marked FIXED by this command.

The placement of power switch cells are rotated by 90/-90 degree when changing from a vertical edge to a horizontal edge. The height of multithreshold-CMOS switch cell, filler cell and corner cell are identical. The width of the switch cell and filler cell are multiple of placement site (unit tile). Corner cells have square boundary.

You should specify density, offset, and list of filler cells for a voltage area and the orientation of the cells to form a ring.

EXAMPLES

The following example creates a multithreshold-CMOS ring using switch library cell, GSWITCH around an object INST, which can be a voltage area or a macro. The space between the ring and the area boundary is 8 microns. All the newly created cell instances, switch cells, corner cells and filler cells, have INST_MTCMOS_ as the prefix.

```
prompt> create_power_switch_ring -area_obj INST \
           -switch_lib_cell GSWITCH -offset 8 -prefix INST_MTCMOS_
```

The following example creates the multithreshold-CMOS ring with density 0.5 from the start point {100 200} to {500 600} counter-clockwise. The space between two switch cells are filled using the library cell FILLER. Each convex corner on the ring is placed using library cell CORNER.

```
prompt> create_power_switch_ring -area_obj INST \
           -switch_lib_cell GSWITCH -density 0.5 \
           -start_point {100 200} -end_point {500 600} \
           -corner_lib_cell CORNER -filler_lib_cells FILLER
```

Data Types

<i>collection_of_nets</i>	collection
<i>list_of_bus_names</i>	list
<i>number_or_name</i>	string
<i>distance</i>	distance

ARGUMENTS

-nets {collection_of_nets}
Specifies the nets on which to create vias. If you specify more than one value, separate the values with a space. If you do not use the **-nets** or **-buses** option, the command creates vias on the power and ground nets.

-buses list_of_bus_names
Specifies the names of the bus nets on which to create vias. If you specify more than one name, separate the names with a comma. If you do not use the **-nets** or **-buses** option, the command creates vias on the power and ground nets.

-from_layer number_or_name
Specifies the source layer from which vias are dropped. The value can be specified as either a layerNumber or maskName from the technology file. The default is to drop the vias from the first vertical layer.

-to_layer number_or_name
Specifies the target layer to which vias are dropped. The value can be specified as either a layerNumber or maskName from the technology file. The default is to target the first horizontal layer.

-from_object_strap
Specifies that vias are dropped from straps. Power and ground straps are created by the **create_power_straps** command. Clock straps are created by the **create_clock_mesh** command.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-from_object_user
Specifies that vias are dropped from user-defined routes.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-from_object_std_pin
Specifies that vias are dropped from standard cell pins.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-from_object_std_pin_connection
Specifies that vias are dropped from standard cell pin connections. Standard cell pin connections are created by the **preroute_standard_cells** command.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-from_object_macro_io_pin
Specifies that vias are dropped from macro I/O pins.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-from_object_macro_io_pin_connection
Specifies that vias are dropped from macro I/O pin connections. Macro I/O pin connections are created by the **preroute_instances** command.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-from_object_ring
Specifies that vias are dropped from power rings, ground rings, and pad rings. Rings are created by the **create_rectangular_rings** and **create_pad_rings** command.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-from_object_bus
Specifies that vias are dropped from buses.
You must specify at least one source object. See the **DESCRIPTION** section for more information about using this option.

-to_object_strap
Specifies that vias are dropped to straps. Power and ground straps are created by the **create_power_straps** command. Clock straps are created by the **create_clock_mesh** command.
You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-to_object_user
Specifies that vias are dropped to user-defined routes.
You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-to_object_std_pin
Specifies that vias are dropped to standard cell pins.
You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-to_object_std_pin_connection
Specifies that vias are dropped to standard cell pin connections. Standard cell pin connections are created by the **preroute_standard_cell** command.
You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-to_object_macro_io_pin
Specifies that vias are dropped to macro I/O pin.
You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-to_object_macro_io_pin_connection
Specifies that vias are dropped to macro I/O pin connections. Macro I/O pin connections are created by the **preroute_instances** command.
You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-to_object_ring
Specifies that vias are dropped to power rings, ground rings, and pad rings. Rings are created by the **create_rectangular_rings** and **create_pad_rings** command.
You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-to_object_bus
Specifies that vias are dropped to buses.

You must specify at least one target object. See the **DESCRIPTION** section for more information about using this option.

-connect_to_targets_on_all_layers_in_between

Drops vias from the source layer to all layers between the source and target layers. By default, vias are dropped only to the target layer.

-ignore_parallel_targets

Keeps vias from being created between two parallel objects.

-do_not_merge_targets

Keeps target objects from being merged before vias are created.

-special_via_rule

Creates a matrix of small via arrays instead of one large via array at wire intersections. Using smaller via arrays could free some routing space. You specify the x- and y-offsets, x- and y-size, and x- and y-step values by using the special via options described below. If the specified values violate design rules, vias are not created.

-special_via_x_offset *distance*

Specifies the x-offset from the lower-left corner of the wire intersection area where you want to create the first special via. The default is 0.0.

-special_via_y_offset *distance*

Specifies the y-offset from the lower-left corner of the wire intersection area where you want to create the first special via. The default is 0.0.

-offset_both_sides_for_special_via

Applies the x- and y- offsets to both the lower-left and upper-right corner of the wire intersection area. By default, the offsets are applied only to the lower-left corner of the wire intersection area.

-special_via_x_size *distance*

Specifies the horizontal size of the special via arrays. The distance is the x-length in user units. The default is 0.0.

-special_via_y_size *distance*

Specifies the vertical size of the special via arrays. The distance is the y-length in user units. The default is 0.0.

-special_via_x_step *distance*

Specifies the horizontal distance between the left sides of adjacent via arrays. The distance is the x-length in user units. The default is 0.0. A via is not created if it would cause DRC violations.

-special_via_y_step *distance*

Specifies the vertical distance between the bottom sides of adjacent via arrays. The distance is the y-length in user units. The default is 0.0. A via is not created if it would cause DRC violations.

-within {{llx lly} {urx ury}}

Specifies the rectangular area within which to create vias. A rectangle is a collection of two points that specifies the lower-left and upper-right corners. A point is a collection of x- and y- coordinates. The value to

substitute for rectangle is in the form {{llx lly} {urx ury}}, where *llx* is the x-coordinate of the lower-left corner and *lly* is its y-coordinate, and *urx* is the x-coordinate of the upper-right corner and *ury* is its y-coordinate. By default, the top cell boundary is used.

-advanced_via_rules

Uses advanced via rules that have been previously set by the **set_preroute_advanced_via_rule** command.

-optimize_via_locations

Saves more tracks for the detail routing when it can adjust vias by small horizontal or vertical distances.

-undo

Removes vias created by the last **create_preroute_vias** run.

-mark_as strap | user_defined | standard_cell_pin_connection | macro_io_pin_connection | ring | bus

macro_io_pin_connection | ring | bus" Marks the created vias with the specified attribute. Valid values are strap, user_defined, standard_cell_pin_connection, macro_io_pin_connection, ring, and bus. The default is the same type as the source object of the via. You can use this option to override the default type.

DESCRIPTION

This command creates vias between specified layers on either power and ground nets, specified nets, or specified bus nets. You can change the internal application of DRC rules by using the **set_preroute_drc_strategy** command.

You must specify at least one source object type and one target object type.

You use the following options to specify the source object type:

- from_object_strap**
- from_object_user**
- from_object_std_pin**
- from_object_std_pin_connection**
- from_object_macro_io_pin**
- from_object_macro_io_pin_connection**
- from_object_ring**
- from_object_bus**

You use the following options to specify the target object type:

- to_object_strap**
- to_object_user**
- to_object_std_pin**
- to_object_std_pin_connection**
- to_object_macro_io_pin**
- to_object_macro_io_pin_connection**
- to_object_ring**
- to_object_bus**

You can combine any number of source and target object type options as long as you use at least one source and one target option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates vias with nets VDDC and VSSC, between strap objects on layers M2 and M3, within the boundaries of a rectangle with lower-left corner coordinates of {10.0 10.0} and upper-right corner coordinates of {1400.0 1400.0}. The created vias have a type of user_defined.

```
prompt> create_preroute_vias \
-nets {VDDC VSSC} \
-from_layer M2 \
-to_layer M3 \
-to_object_strap \
-from_object_strap \
-within {{10.0 10.0} {1400.0 1400.0}}
-mark_as user_defined
```

create_pst

Creates a power state table (PST), using a specific order of supply nets.

SYNTAX

```
string create_pst

-supplies list
```

Data Types

<i>table_name</i>	string
<i>list</i>	list

ARGUMENT

<i>table_name</i>	Specifies the name of the power state table. This argument is required.
<i>-supplies list</i>	Specifies a list of supply nets or ports to include in each power state table in the design. This option is required.

DESCRIPTION

The **create_pst** command creates a power state table using a specific order of supply nets. A power state table is used for implementation specifically for synthesis, analysis, and optimization. The power state table defines the legal combinations of states, which are those combinations of states that can exist at the same time during the operation of the design.

The power state table has no simulation semantics. It is tool-dependent as to whether the simulation tools report an error if an illegal (unspecified) combination of states occurs.

An error occurs if a specified supply net has not been created before the **create_pst** command is run.

This command returns the name of the power state table if it is created, or the null string if the power state table is not created.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of the **create_pst** command:

```
prompt> create_pst MyPowerStateTable -supplies {PN1 PN2 SOC/OTC/PN3}
```

SEE ALSO

`add_port_state(2)`
`add_pst_state(2)`
`report_pst(2)`

create_qor_snapshot

Creates a QoR snapshot of timing, physical, constraints, clock, and power data on active scenarios and stores it in the location specified by the **icc_snapshot_storage_location** variable.

NOTE: This is the new version of the **create_qor_snapshot** command that supports both multicorner-multimode designs as well as non-multicorner-multimode designs.

SYNTAX

```
create_qor_snapshot
[-name name]
[-power]
[-clock_tree]
[-show_all]
[-save_mw]
[-significant_digits digits]
```

ARGUMENTS

```
-name name
      Specifies the name of the QoR snapshot. The snapshot name should start with a letter. It can be used to identify the particular QoR snapshot.

-power
      Records dynamic and static power (optional).

-clock_tree
      Records clock tree information (optional).

-show_all
      Show all clock groups, default only show clock groups that are violated (optional).

-save_mw
      Save design using snapshot name (optional).
```

DESCRIPTION

The **create_qor_snapshot** command generates and report data of timing, DRC, area, clock, power, etc on active scenarios.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

In the following example, **create_qor_snapshot** will record the QoR snapshot named *preroute* from the current design status and save it under design/snapshot directory.

```
prompt> create_qor_snapshot -name preroute
```

SEE ALSO

`remove_qor_snapshot(2)`
`report_qor_snapshot(2)`

create_qtm_clock

Creates a quick timing model (QTM) clock port.

SYNTAX

```
string create_qtm_clock
-type clock_type
clock_list
```

Data Types

<i>clock_type</i>	string
<i>clock_list</i>	list

ARGUMENTS

-type *clock_type*

Specifies the type of clock. The clock can be one of the following types: clock or generated_clock. This will help in defining an existing port or creating an internal pin as a clock port.

clock_list

Specifies the list of QTM clock ports that you want to create.

DESCRIPTION

This command creates a QTM clock port. You can create a single clock port or a list of clock ports with this command. If there is an existing **create_qtm_port** command with the same port name, then the clock port will have the same direction as the previously created port. If there no existing port with the same clock port name, then a new port definition will be created with the direction as internal.

Please note that this command doesn't create a clock definition. It just creates an internal clock pin or designates an existing QTM port as clock port.

To show the information about the current QTM model, use **report_qtm_model** command.

For a basic description about QTM, please refer to **create_qtm_model** man page. For a more detailed description about QTM, please refer to the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example creates a clocked QTM port CLK.

```
prompt> create_qtm_clock CLK -type clock
```

The following example creates QTM output clock port C.

```
prompt> create_qtm_port {C} -type output
prompt> create_qtm_clock {C} -type clock
```

The following example creates QTM internal generated clock pin C_int.

```
prompt> create_qtm_clock C_int -type generated_clock
```

SEE ALSO

`create_qtm_model(2)`
`report_qtm_model(2)`
`save_qtm_model(2)`
`set_qtm_port_drive(2)`
`set_qtm_port_load(2)`

create_qtm_constraint_arc

Creates a constraint arc for a quick timing model (QTM) .

SYNTAX

```
string create_qtm_constraint_arc
[-name arc_name]
[-setup] [-hold]
-from port_name [-to port_spec]
-edge triggering_edge
[-path_type name]
[-path_factor multiplication_factor]
[-value constraint_value]
[-input_transition_fall ftrans]
[-input_transition_rise rtrans]
```

Data Types

<i>arc_name</i>	string
<i>port_name</i>	string
<i>port_spec</i>	list
<i>triggering_edge</i>	string
<i>name</i>	string
<i>multiplication_factor</i>	float
<i>constraint_value</i>	float

ARGUMENTS

```
-name arc_name
      Specifies the name of the constraint arc.

-setup
      Creates a setup arc.

-hold
      Creates a hold arc.

-from port_name
      Specifies the constraining port name. Define this port as a clock port.

-to port_spec
      Specifies the constrained port. Define this port as an input/inout port.

-edge triggering_edge
      Specifies the triggering edge of the clock (rise/fall).

-path_type name
      Specifies the path type you want to use to set the delay.

-path_factor multiplication_factor
      Specifies the multiplication factor for the path type.
```

```
-value constraint_value
    Specifies the delay value in terms of the time units you use for the model.
```

DESCRIPTION

This command allows you to create a constraint arc in a QTM. The **-from** port denotes the constraining port, and the **-to** port denotes the constrained port. The **-from** port must be defined as a clock port and the **-to** port must be an input/inout port.

The **-setup** and **-hold** switches are used to specify either a setup arc or a hold arc. You must use one of the switches and cannot use both simultaneously. To specify the triggering edge of the clock, use the **-edge** option. The option takes rise/fall as valid values.

To specify the delay value, use **-path_type**. You can specify the delay as a value in terms of the time units used in the design. Use either the **-path_type** or the **-value** option; you cannot use both simultaneously.

If the constraint arc is a setup arc, the QTM parameter global setup time is added to the value of the specified setup. If the constraint arc is a hold arc, the global hold time is added to the value of hold specified. You must define the global setup time before creating any setup arc and global hold time before creating any hold arc. The command checks to see if these parameters are defined. Global setup and time, and global hold time are defined using the **set_qtm_global_parameter** command.

To see the information about the current QTM model, use **report_qtm_model** command.

For basic description about QTM, please refer to **create_qtm_model** man page. For a more detailed description about QTM please refer to the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following command creates a setup arc from the positive edge of constraining pin CLK to IN1 (constrained pin) with a delay equivalent to 2 times that of path type path1.

```
prompt> create_qtm_constraint_arc -setup -edge rise -from CLK -to IN1 -
path_type path1 -path_factor 2
```

The following command creates a hold arc from the positive edge of constraining pin CLK to IN1 (constrained pin) with a delay equivalent to 2 times that of path type path1.

```
prompt> create_qtm_constraint_arc -hold -edge rise -from CLK -to IN1 -
path_type path1 -path_factor 2
```

The following command creates a hold arc from the positive edge of constraining pin

CLK to IN1 (constrained pin) with a delay of 3 time units.

```
prompt> create_qtm_constraint_arc -hold -edge rise -from CLK -to IN1 -value 3.0
```

`report_qtm_model(2)`

create_qtm_delay_arc

Creates a delay arc for a quick timing model (QTM).

SYNTAX

```
string create_qtm_delay_arc
[-name arc_name]
-from port_spec
-to port_spec
[-edge triggering_edge]
[-path_type path_type]
[-path_factor multiplication_factor]
[-value delay_value]
[-total_value total_value]
[-input_transition_fall ftrans]
[-input_transition_rise rtrans]
```

Data Types

<i>arc_name</i>	string
<i>port_spec</i>	list
<i>path_type</i>	string
<i>multiplication_factor</i>	float
<i>delay_value</i>	float
<i>total_value</i>	float

ARGUMENTS

```
-name arc_name
      Specifies the name of the delay arc.

-from port_spec
      Specifies the QTM port name or a collection of QTM ports, which is the start
      point of the delay arc. For an edge triggering arc this must be a clock.

-to port_spec
      Specifies the QTM port name or a collection of QTM ports. This port must be
      output/inout type.

-edge triggering_edge
      Specifies the triggering edge (rise or fall)

-path_type path_type
      Specifies the path type you want to use to set the delay.

-path_factor multiplication_factor
      Specifies the multiplication factor for the path type.

-value delay_value
      Specifies the delay value in terms of the time units you use for the model.
      By default, the drive arc delay is added on top of the QTM delay arcs created
      to the output port and therefore increase the actual delay.
```

```
-total_value total_value
    Specifies the total value in terms of the time units you use for the model.
    This option indicates that the drive arc delay computed with max load is to
    be subtracted from the total delay budgeted to this output port.
```

DESCRIPTION

This command allows you to create a delay arc in a QTM from a QTM port or collection of QTM ports to a port or collection of QTM ports. If you specify a list of ports for the **from** and **to** ports, a delay arc is created from each start port to each end port.

To create a edge triggering arc, use the **-edge** option. For an edge trigerring arc, the **clk_to_output** delay (specified as a global parameter) is added to the delay value specified.

You can use a **-path_type** to specify the delay value or you can specify the delay as a value in terms of the time units used in the design. Use either the **-path_type** or the **-value** option; you cannot use both options simultaneously.

When delay arc is defined for an output port, by default, the actual delay to the output port will be the delay arc defined by this command for the port plus the delay computed for the drive arc at the output port defined by **create_qtm_port_drive**. If in your QTM creation, the delay defined by **create_qtm_delay_arc** for the port is actually the maximum delay budgeted for the output and you do not want the drive arc to add extra delay on top of that budget, you can optionally use **-total_value**, instead of **-value** to keep the delay with maximum load at port unchanged. But with smaller load at the output port, the delay may actually be smaller than the budgeted maximum delay.

To show the information about the current QTM model, use **report_qtm_model** command.

For a basic description about QTM, please refer to **create_qtm_model** man page. For a more detailed description about QTM, please refer to the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following command creates a delay arc from input ports {A, B, C} to output port D with a delay value of 2.0 time units.

```
prompt> create_qtm_delay_arc -from {A, B, C} -to D -value 2.0
```

The following command creates an arc from clock CLK to output port OUT with a delay equivalent to 3 times that of path type 'path1'.

```
prompt> create_qtm_delay_arc -from CLK -to OUT -path_type path1 -path_factor 3
```

The following example uses wildcard to match all ports matching "CL*".

```
prompt> create_qtm_delay_arc -from CL* -to OUT -path_type path1 -path_factor 3
```

The following example uses a collection for the QTM port 'CLK'.

```
prompt> create_qtm_delay_arc -from [get_qtm_ports CLK] -to OUT -path_type path1 -path_factor 3
```

SEE ALSO

[create_qtm_constraint_arc\(2\)](#)

[report_qtm_model\(2\)](#)
[save_qtm_model\(2\)](#)

create_qtm_drive_type

Creates a drive type in a quick timing model (QTM).

SYNTAX

```
string create_qtm_drive_type
-lib_cell lib_cell_name
[-input_pin pin_name]
[-output_pin pin_name]
[-input_transition_rise rtrans]
[-input_transition_fall ftrans]
drive_type_name
[-lib_cell_input_transition lib_cell_input_transition]
```

Data Types

lib_cell_name	string
rtrans	float
ftrans	float
drive_type_name	string

ARGUMENTS

-lib_cell lib_cell_name
Specifies the library cell name in the technology library.

-input_pin pin_name
Specifies the input pin in the lib_cell is the start point of the arc and ends in the output pin.

-output_pin pin_name
Specifies the output pin in the lib_cell that specifies the drive.

-input_transition_rise rtrans
Specifies the input rising transition time associated with the **-input_pin** to compute the delay for the drive arc. If you do not include this option, the delay table for rising input of the drive arc will be loaded from library as is.
Use the **-input_transition_rise** and **-input_transition_fall** options to capture the transition time associated with the *input_pin*. This can obtain more accurate information on the transition time and delay time for the defined drive arc.

-input_transition_fall ftrans
Specifies the input falling transition time associated with the *input_pin* to compute the delay for the drive arc. If you do not include this option, the delay table for falling input of the drive arc will be loaded from library as is.

drive_type_name
Specifies the name given to the defined drive type.

DESCRIPTION

This command can be used to create a drive type. The defined drive type can be used to set the drives on output ports. The drive type is specified by referring to a lib_cell in the technology library. The lib_cell is specified by using the **-lib_cell** option. This lib_cell must be present in the technology library.

The output pin which drives the port is specified by using the **-output_pin** option. In addition, you can specify the input pin by using the **-input_pin** option. This option selects an arc that drives the output pin of the lib_cell.

If neither the input pin nor the output pin is specified, an arbitrary arc is chosen to define the drive type. If the input pin is specified and output pin is not specified, an arbitrary arc starting from the input pin defines the drive type. If the output pin is specified and input pin is not specified, the arbitrary delay arc coming into the output pin defines the drive type. If both input and output pins are specified, the lib_cell must have an combinational arc from the input pin to the output pin.

To use this command you must read in the technology library and then specify it by using the **set_qtm_technology** command.

To show the information about the current QTM model, use **report_qtm_model** command.

For a basic description QTM, see the **create_qtm_model** man page. For a more detailed description, see Chapter 12 of the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

In the following examples it is assumed that you have loaded the technology library, and the QTM technology is set. Do this by using the following the sequence of commands as a guide, substituting the name of your technology library.

```
prompt>read_db my_technology_library.db
prompt>set_qtm_technology -library my_technology_library
```

The following command creates a drive type equivalent to the lib_cell **BUF1**.

```
prompt> create_qtm_drive_type -lib_cell BUF1 drive1
```

The following command creates a drive type **drive2** equivalent to lib_cell **BUF2** and specifies the output pin to use.

```
prompt> create_qtm_drive_type -lib_cell BUF2 -output_pin Y drive2
```

SEE ALSO

create_qtm_load_type(2)

create_qtm_drive_type

```
create_qtm_model(2)

set_qtm_technology(2)
```

create_qtm_generated_clock

Creates a generated clock for a quick timing model (QTM) .

SYNTAX

```
string create_qtm_generated_clock
-source master_clock_name
[-divide_by divide_factor
 | -multiply_by multiply_factor]
[-invert]
generated_clock_name
```

Data Types

<i>master_clock_name</i>	string
<i>divide_factor</i>	int
<i>multiply_factor</i>	int
<i>generated_clock_name</i>	string

ARGUMENTS

```
-source master_clock_name
    Specifies the name of the clock defined as master source of the generated
    clock. The master source must be defined as a clock, or a generated clock,
    prior to the generated_clock definition.

-divide_by divide_factor
    Specifies the frequency division factor. If the divide_factor value is 2, the
    generated clock period is twice as long as the master clock period.

-multiply_by multiply_factor
    Specifies the frequency multiplication factor. If the multiply_factor value
    is 3, the generated clock period is one-third as long as the master clock
    period.

-invert
    Inverts the generated clock signal (in the case of frequency multiplication
    and division).

generated_clock_name
    Specifies the name of the generated clock. If the name has been used in
    defining a port or internal pin, then the generated_clock will be defined on
    the existing port or internal pin. Otherwise, a new same-named internal pin
    will be created to be the source of the generated clock.
```

DESCRIPTION

This command creates QTM generated clock. A generated clock can be defined on the external port of the QTM, as well as internal pin in the QTM. After definition of the generated clock, the source port/pin can be used in other QTM commands the same way as those port/pins defined by **create_qtm_port**, i.e. delay arcs from or to the

generated clock source pin can be defined with **create_qtm_delay_arc**; constraint arcs related to the generated clock can be defined with **create_qtm_constraint_arc**.

For a basic description about QTM, please refer to **create_qtm_model** man page. For a more detailed description about QTM, please refer to the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example creates a divide-by 2 generated clock on an internal pin, assume there is no port defined with name "GCLK_int", with master clock CLK.

```
prompt> create_qtm_generated_clock GCLK_int -source CLK -multiply_by 2
```

The following example creates a generated clock on port GCLK, assume GCLK has already been defined as a port with command **create_qtm_port**.

```
prompt> create_qtm_generated_clock GCLK -source CLK -divide_by 2 -invert
```

SEE ALSO

```
create_qtm_model(2)  
report_qtm_model(2)  
save_qtm_model(2)  
create_qtm_delay_arc(2)  
create_qtm_constraint_arc(2)
```

create_qtm_insertion_delay

Specifies the insertion delay on the clock port of a quick timing model (QTM) .

SYNTAX

```
string create_qtm_insertion_delay
[-max]
[-min]
[-value insertion_delay]
port_list
```

Data Types

<i>insertion_delay</i>	float
<i>port_list</i>	list

ARGUMENTS

-max

Specifies whether to generate insertion delay for Maximum operating condition.

-value insertion_delay

Specifies the insertion delay in terms of the time units you use for the model.

port_list

Specifies a list of clock ports on which to set internal clock latency. Each element in the list is either a collection of QTM ports or a pattern that matches QTM ports.

DESCRIPTION

This command creates the insertion delay for a clock port on the QTM model. The insertion delay is the network latency from the clock port to a (hypothetical) FlipFlop inside the QTM model.

If the CTS has been done on the design, then there would be network latency for all the clock pins of the FlipFlops. If some of the hierarchical blocks in the design are replaced by blackboxes, then the user can generate QTM models for the blackboxes to represent their timing model.

If the user generates the QTM models for the blackboxes, then *create_qtm_insertion_delay* command can be called to set the network delay from clock port of the hierarchical block to FlipFlop inside the hierarchical block, as the insertion delay.

To show the information about the current QTM model, use the **report_qtm_model** command.

For a basic description about QTM, see the **create_qtm_model** man page. For a more

create_qtm_insertion_delay

detailed description about QTM, see the design planning chapter of the *IC Compiler User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following command sets the insertion delay on CLK to be 2.0 for Max mode.

```
prompt> create_qtm_insertion_delay -max -value 2.0 CLK
```

The following command sets the insertion on CK to be 4.5 for both Max and Min modes.

```
prompt> create_qtm_insertion_delay -value 4.5 CK
```

SEE ALSO

```
create_qtm_model(2)
create_qtm_port(2)
report_qtm_model(2)
save_qtm_model(2)
create_qtm_clock(2)
```

create_qtm_load_type

Creates a load type for a quick timing model (QTM) description.

SYNTAX

```
string create_qtm_load_type
-lib_cell name
[-input_pin pin_name]
load_type name
```

ARGUMENTS

-lib_cell name
Specifies the name of the library cell in the technology library.

-input_pin pin_name
Specifies the input pin in the lib_cell to specify capacitance.

load_type name
Specifies the name given to the defined load type.

DESCRIPTION

This command is used to create a load type. A load type can be used to define the load on a QTM input port. The load type is specified by referring to a lib_cell in the technology library. The **lib_cell** is specified using the **-lib_cell** option. **lib_cell** must be present in the specified technology library.

The input pin can be specified by using the **-input_pin** option. If the input pin is not specified, an arbitrary input pin is chosen to define the load type.

To use this command you must first read in the technology library, then specify the technology library by using the **set_qtm_technology** command.

To show the information about the current QTM model, use **report_qtm_model** command.

For a basic description about QTM, please refer to **create_qtm_model** man page. For a more detailed description about QTM, please refer to Chapter 12 of the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

In the following examples the technology library is loaded by you and the QTM technology is set. This is done by the following sequence of commands:

```
prompt>read_db my_technology_library.db
```

```
create_qtm_load_type
```

```
prompt>set_qtm_technology -library my_technology_library
```

The following command creates a load type 'load1' using cell OR1. Since the input pin name is not specified, QTM selects an arbitrary input pin.

```
prompt> create_qtm_load_type -lib_cell OR1 load1
```

The following command creates a load type 'load2' using cell OR1, input pin A.

```
prompt> create_qtm_load_type -lib_cell OR1 -input_pin A load2
```

SEE ALSO

```
create_qtm_drive_type(2)  
create_qtm_model(2)  
create_qtm_path_type(2)  
report_qtm_model(2)  
save_qtm_model(2)  
set_qtm_port_load(2)
```

create_qtm_model

Begins the definition of a quick timing model (QTM) description.

SYNTAX

```
string create_qtm_model  
model_name
```

Data Types

model_name string

ARGUMENTS

model_name
Specifies the name of the generated model.

DESCRIPTION

Specifies the name of a new quick timing model (QTM) to be created by ICC Design Planning. QTMs are temporary timing models that can be created quickly for a block using ICC Design Planning commands. The purpose of these commands is to provide timing information without the necessity of writing a detailed timing model.

QTMs are intended to be used early in the design cycle to describe rough initial timing of a block. These models will eventually be replaced, either by some other detailed timing model or by the netlist of the block, to obtain more accurate timing. For a more detailed description of QTMs, see the *ICC Design Planning User Guide*.

A QTM model can be saved as a Synopsys DB file, which can be instantiated in a design in the same way library cells or ITS models are instantiated. Both Design Compiler and JupiterXT accept designs with instantiated QTMs. To save a QTM model, use the **save_qtm_model** command.

Other commands in the QTM command set must be placed between a **create_qtm_model** and **save_qtm_model** command. Many QTM commands exist for specifying, configuring and examining QTMs. The following is not an exhaustive list, but gives examples of tasks you can perform using QTM commands:

- To create a QTM port, use the **create_qtm_port** command.
- To create constraint arcs and delay arcs, use the **create_qtm_constraint_arc** and the **create_qtm_delay_arc** commands, respectively.
- To set the drive of a QTM output port, use the **set_qtm_port_drive** command.

- To set the load of a QTM input port, use **set_qtm_port_load** command.
- To show the information about the current QTM model, use the **report_qtm_model** command.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following command creates a new QTM model with the name adder.

```
prompt> create_qtm_model adder
```

SEE ALSO

```

create_qtm_port(2)
report_qtm_model(2)
save_qtm_model(2)
set_qtm_global_parameter(2)
set_qtm_port_drive(2)
set_qtm_port_load(2)
set_qtm_technology(2)
```

create_qtm_path_type

Creates a path type in a quick timing model (QTM) description.

SYNTAX

```
string create_qtm_path_type
-lib_cell name
[-input_pin pin_name]
[-output_pin pin_name]
[-fanout count]
path_type name
```

Data Types

<i>name</i>	string
<i>pin_name</i>	string
<i>count</i>	integer-range

ARGUMENTS

```
-lib_cell name
    Specifies the name of the library cell in the technology library.

-input_pin pin_name
    Specifies the input pin in the lib_cell, which is the start point of the arc,
    to define the path type.

-output_pin pin_name
    Specifies the output pin in the lib_cell, which is the end point of the arc,
    to define the path type.

-fanout count
    Specifies the average fanout (number of pins) to consider while computing the
    delay of the path type. The fanout count can range from 1 to 1000. By default
    this is 1.

path_type name
    Specifies the name given to the defined path type.
```

DESCRIPTION

This command is used to create a path type. A path type mimics an arc in a library cell. An arc in the QTM model is defined in terms of the delays of the path type. The path type is specified by referring to a lib_cell in the technology library. The lib_cell is specified using the **-lib_cell** option. This lib_cell must be present in the technology library specified.

You can specify the average fanout count the arc fans out to while defining the path type. It is assumed the arc fans out to the first input pin of the same library cell, while calculating the delays. The input pin is specified by using the **-input_pin** option. The output pin is specified by using the **-output_pin** option.

If neither input pin nor the output pin is specified, an arbitrary delay arc in the lib_cell is chosen to define the path type.

If the input pin is specified and output pin is not specified, an arbitrary delay arc starting from the input pin defines the path type.

If the output pin is specified and input pin is not specified, an arbitrary delay arc coming into the output pin defines the path type.

If both input and output pins are specified, the lib_cell must have an arc from the input pin to the output pin.

To use this command you must read in the technology library then specify the technology library by using the **set_qtm_technology** command.

To show the information about the current QTM model, use **report_qtm_model** command.

For a basic description about QTM, please refer to **create_qtm_model** man page. For a more detailed description about QTM, please refer to Chapter 12 of the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

In the following examples the technology library is loaded by the user and the qtm technology is set. This is done by the following sequence of commands:

```
prompt>read_db my_technology_library.db
prompt>set_qtm_technology -library my_technology_library
```

The following command creates a path type path1 by using lib_cell AN2, with an average fanout count of 2 (uses default input, output pins).

```
prompt> create_qtm_path_type -lib_cell AN2 -fanout 2 path1
```

The following command creates a path type path2 by using cell AN2, with an average fanout count of 2, and using pin 'A' as the starting point for the path type.

```
prompt> create_qtm_path_type -lib_cell AN2 -input_pin A -fanout 2 path2
```

The following command creates a path type path3 by using cell AN2, with an average fanout count of 2, using 'A' as the start point of the arc, and pin 'Z' as the end point of the arc.

```
prompt> create_qtm_path_type -lib_cell AN2 -input_pin A -output_pin Z -fanout 2 path3
```

```

create_qtm_path_type
524

create_qtm_port

Creates a quick timing model (QTM) port.

SYNTAX

```
string create_qtm_port
-type port_type
port_list
```

Data Types

<i>port_type</i>	string
<i>port_list</i>	list

ARGUMENTS

-type *port_type*
Specifies the type of port. The port can be one of the following types: input, output, inout, internal or clock. If you want a port to be a clock, define it as a clock port.

port_list
Specifies the list of QTM ports you want created.

DESCRIPTION

This command creates QTM port. You can create a single port or a list of ports with this command. The ports can be input, output, inout, internal or clock. Any port that constrains another port or has a edge triggered launch arc originating from it, has to be defined to be of the type 'clock'.

Bused ports are also defined by giving the start and end index (A[0:5]). Bused ports cannot be internal.

To show the information about the current QTM model, use **report_qtm_model** command.

For a basic description about QTM, please refer to **create_qtm_model** man page. For a more detailed description about QTM, please refer to the *ICC Design Planning User Guide*.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example creates an input bused QTM port A[0:5].

```
prompt> create_qtm_port A[0:5] -type input
```

The following example creates a clocked QTM port CLK.

```
prompt> create_qtm_port CLK -type clock
```

The following example creates QTM output ports A, B, C, and D.

```
prompt> create_qtm_port {A B C D} -type output
```

The following example creates QTM internal pin D_int.

```
prompt> create_qtm_port D_int -type internal
```

SEE ALSO

`create_qtm_model(2)`
`report_qtm_model(2)`

`set_qtm_port_drive(2)`
`set_qtm_port_load(2)`

create_rail_setup

Creates a setup file and writes out necessary files for performing rail analysis in PrimeRail.

SYNTAX

```
status create_rail_setup
[-sdc sdc_file]
[-spef spef_file]
[-verilog verilog_file]
[-no_rc_extract]
[-hierarchy]
[-directory dir_name]
[-parasitic_corner min | max]
[-no_save]
[-upf string]
```

Data Types

<i>sdc_file</i>	string
<i>spef_file</i>	string
<i>verilog_file</i>	string
<i>dir_name</i>	string

ARGUMENTS

-sdc *sdc_file*

Specifies an existing SDC file to use.

If you do not specify both this option and the **-hierarchy**, the command generates an SDC file for the current Milkyway design.

-spef *spef_file*

Specifies an existing SPEF file to use.

If you do not specify both this option and the **-hierarchy**, the command performs RC extraction and generates an SPEF file for the maximum corner of the current Milkyway design.

If RC extraction has already been done, use the **-no_rc_extract** option to skip RC extraction.

To generate an SPEF file for the minimum corner instead of the maximum corner, use the **-parasitic_corner min** option.

-verilog *verilog_file*

Specifies an existing Verilog file to use.

If you do not specify this option, the command generates a Verilog file for the current Milkyway design.

-no_rc_extract

Skips RC extraction.

Use this option to avoid rerunning extraction if you have already run the **extract_rc** command and the parasitics are in the memory.

```

-hierarchy
    Generates only the Verilog, UPF, and PrimeRail setup files for the top-level
    design in a hierarchical flow. This option is used for the full-chip sign-
    off flow. You must provide the signal parasitics and the SDC file.

-directory dir_name
    Specifies the output directory where the files required for rail analysis are
    output.
    If you do not specify this option, the command puts the files in a directory
    called synopsys_rail_setup.

-parasitic_corner min | max
    Specifies the parasitic corner used for generating the SPEF file.
    If you do not specify this option, the command uses the maximum corner to
    generate the SPEF file.

-no_save
    Do not save the Milkyway design.
    By default, the command saves the design in a cell called design_name_pr.

```

DESCRIPTION

The **create_rail_setup** command creates the files necessary for running PrimeRail. By default, the command writes the following files to the specified output directory (the default directory is *synopsys_rail_setup*):

```

synopsys_pr_setup.e
design_name.v
design_name.spef
design_name.sdc
design_name.upf

```

Note that the UPF file is generated only if the tool is running in UPF mode.

The *design_name* prefix used in the file names is the return value of the *current_design* command in *icc_shell*. For example, if *current_design* returns "top" in *icc_shell*, the Verilog output file name is "top.v".

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLE

The following example runs the **create_rail_setup** command with no options:

```
prompt> create_rail_setup
```

The following example skips RC extraction.

```
prompt> create_rail_setup -no_rc_extract
```

SEE ALSO

`extract_rc(2)`

create_rectangular_rings

Creates rectangular rings in the design.

SYNTAX

```
integer create_rectangular_rings

<i>collection_of_nets</i>	collection
<i>number_or_name</i>	string
<i>distance</i>	distance

ARGUMENTS

```
-around core | specified | specified_as_group | all_macros_except_specified | rectangle
    Defines the area for which to specify rings. The valid values are defined as follows:
    core creates rings around the predefined core area.
    specified creates rings around instances specified by using the -cells option.
    specified_as_group creates rings around instances specified by using the -cells option, treating all the instances as one group.
    all_macros_except_specified creates rings around all macros except those specified by using the -cells option. If you do not use the -cells option, the all_macros_except_specified option creates rings around all macros in the design.
    rectangle creates rings around the rectangle specified by using the -within option.
    You must select only one of these values. The default is core.
```

```
-cells {collection_of_cells}
    Specifies a collection of instances for the -around option when it is used with the specified, specified_as_group, or all_macros_except_specified value.
```

```
-within {{llx lly} {urx ury}}
    Specifies the rectangular area within which to create rings. A rectangle is a collection of two points that specifies the lower-left and upper-right corners. A point is a collection of X and Y coordinates. The value to substitute for rectangle is in the form {{llx lly} {urx ury}}, where llx is the X coordinate of the lower-left corner and lly is its Y coordinate, and urx is the X coordinate of the upper-right corner and ury is its Y coordinate. By default, the top cell boundary is used.
```

```
-nets {collection_of_nets}
    Specifies nets to create rectangular rings. If you have more than one net in collection, separate each one by a space.
```

```
-skip_left_side
    Specifies not to create the left side of the ring.
```

```
-skip_right_side
    Specifies not to create the right side of the ring.
```

```
-skip_bottom_side
    Specifies not to create the bottom side of the ring.
```

```
-skip_top_side
    Specifies not to create the top side of the ring.
```

```
-left_segment_layer number_or_name
    Specifies the layer on which you want the left section of the ring. The value can be specified either as layerNumber or maskName from the technology file. By default, the first vertical layer is used.
```

-right_segment_layer *number_or_name*
Specifies the layer on which you want the right section of the ring. The value can be specified either as layerNumber or maskName from the technology file. By default, the first vertical layer is used.

-bottom_segment_layer *number_or_name*
Specifies the layer on which you want the bottom section of the ring. The value can be specified either as layerNumber or maskName from the technology file. By default, the first horizontal layer is used.

-top_segment_layer *number_or_name*
Specifies the layer on which you want the top section of the ring. The value can be specified either as layerNumber or maskName from the technology file. By default, the first horizontal layer is used.

-left_segment_width *distance*
Specifies the width of the left section of the ring. By default, the **minWidth** for layer is used.

-right_segment_width *distance*
Specifies the width of the right section of the ring. By default, the **minWidth** for layer is used.

-bottom_segment_width *distance*
Specifies the width of the bottom section of the ring. By default, the **minWidth** for layer is used.

-top_segment_width *distance*
Specifies the width of the top section of the ring. By default, the **minWidth** for layer is used.

-offsets *adjusted* | *absolute*
Selects a setting for the ring offsets. Valid arguments are **adjusted** and **absolute**; select only one. The **absolute** value prevents automatic adjustment to correct violations. As a result, there may be a design rule checking (DRC) violation, and the section of the ring causing a violation is not created. The **adjusted** value allows automatic adjustment of the ring position to avoid DRC violations. By default, **adjusted** is used.

-left_offset *distance*
Specifies the offset on the left side of the ring. By default the offset is **0.0**.

-right_offset *distance*
Specifies the offset on the right side of the ring. By default the offset is **0.0**.

-bottom_offset *distance*
Specifies the offset on the bottom side of the ring. By default the offset is **0.0**.

-top_offset *distance*
Specifies the offset on the top side of the ring. By default the offset is **0.0**.

-extend_ll
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the left segment of the ring low. See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-extend_lh
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the left segment of the ring high. See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-extend_rl
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the right segment of the ring low. See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-extend_rh
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the right segment of the ring high. See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-extend_b1
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the bottom segment of the ring low (left). See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-extend_bh
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the bottom segment of the ring high (right). See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-extend_t1
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the top segment of the ring low (left). See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-extend_th
Extends rings to the top cell boundary or to the first target on the same net. Use this option to extend the top segment of the ring high (right). See the **DIRECTIONS** section for details on all of the directions in which you can extend rings. By default, this option is turned off.

-create_innermost_core_ring_conservatively
Places the innermost core ring far enough away from the core boundary to allow cell placement without DRC violations. This option works only if you also specify the **-around** option with the **core** value. You might want to use this option when you are creating core rings before cell placement. The tool scans all the standard cells to determine the maximum distance any cell could extend from the core boundary after placement. That maximum distance is placed in

between the innermost core ring and the core boundary. This space is a conservative estimate and could be more than is actually necessary. Note that macros are ignored in the calculation.

-ignore_parallel_targets

Keeps a ring segment from connecting passing targets if the targets are parallel to the segment. By default, each ring segment connects all passing targets.

-advanced_via_rules

Uses advanced via rules that have been previously set by the command **set_preroute_advanced_via_rule**. By default, this option is turned off.

-extend_for_multiple_connections

Extends ring segments to reach more targets on the same net. The extension continues until either there are no more targets in the respective directions or the next target exceeds the spacing threshold set by the *distance* value of the **extension_gap** option.

-extension_gap distance

Specifies the space threshold for multiple connections. Adjacent targets closer than the *distance* value are connected. The default is **0.0**.

-undo

Removes rings created by the last **create_rectangular_rings** run.

DESCRIPTION

This command creates rectangular rings in the design. If a blockage does not allow the tool to place the ring in the area you specified, the tool places the ring in the closest legal position. You have the choice of preventing the tool from automatically adjusting the ring position; in which case, if the ring you specify creates a design rule checking (DRC) error, the tool does not create the segment of the ring causing the violation. You can change the internal application of the DRC rules by using the **set_preroute_drc_strategy** command. Specify at least one net.

As a prerequisite for using the **create_rectangular_rings** command, use the **connect_pg_nets** command to specify port-to-net connections for power and ground nets that are not in the netlist.

You can extend a ring in any or all of several directions to the top cell boundary or to the first target on the same net. Use the following options to extend a ring in the direction described:

- extend_ll** extends the left segment of the ring low.
- extend_lh** extends the left segment of the ring high.
- extend_rl** extends the right segment of the ring low.
- extend_rh** extends the right segment of the ring high.
- extend_b1** extends the bottom segment of the ring low (left).
- extend_bh** extends the bottom segment of the ring high (right).
- extend_t1** extends the top segment of the ring low (left).
- extend_th** extends the top segment of the ring high (right).

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a rectangular ring with a net named *VDD*, within the boundaries of a rectangle with coordinates $(10.0\ 10.0)(1400.0\ 1400.0)$, with left and right sides on layer *M2*, width 0.42, bottom and top sides on layer *M3*, and width of 0.2.

```
prompt> create_rectangular_rings -nets VDD \
-within {{10.0 10.0} {1400.0 1400.0}} \
-left_segment_layer M2 -right_segment_layer M2 \
-bottom_segment_layer M3 -top_segment_layer M3 \
-left_segment_width 0.42 -right_segment_width 0.42 \
-bottom_segment_width 0.2 -top_segment_width 0.2
```

<i>space_between_h_segments</i>	distance
<i>space_between_v_segments</i>	distance
<i>x_extension</i>	distance
<i>y_extension</i>	distance
<i>distance</i>	space
<i>offset</i>	distance
<i>space</i>	distance

ARGUMENTS

-nets {collection_of_nets}

Specifies the power and ground nets for which to create rectilinear rings. Rings are created for each net specified in this option. The order of rings corresponds to the order of nets in the collection: the outermost ring is assigned to the first net and the innermost inner ring is assigned to the last net. If you need to create more than one ring for the same net, include that net in the collection as many times as you need. This option is mandatory unless you use the **-undo** option.

-around core | macros | all_macros_except_specified

Defines the areas around which rings are created. Valid arguments are core, macros, and all_macros_except_specified. You can specify only one of these

arguments. Use **-around core** to create rings around the predefined core area. Use **-around macros** to create rings around the macro cell instances specified in the **-macro_cells** option. Use **-around all_macros_except_specified** to create rings around each macro cell instance in the design, except those specified in the **-macro_cells** option.

The default value is **-around core**.

-macro_cells {collection_of_macro_cells}

Specifies a collection of macro cell instances. The meaning of this option depends on the value of the **-around** option:

- If you specify **-around core**, you cannot specify the **-macro_cells** option.
- If you specify **-around macros**, the **-macro_cells** option is required and specifies the macro cell instances around which the rings are created.
- If you specify **-around all_macros_except_specified**, the tool creates rings around all macro cell instances in the design, except those specified in the **-macro_cells** option. If you specify **-around all_macros_except_specified** and do not specify **-macro_cells**, rings are created around all macro cell instances in the design.

-offset {x_offset y_offset}

Specifies the offset of the inner boundary of the ring from the boundary of the area around which the rings are created. *x_offset* specifies the offset for vertical segments. *y_offset* specifies the offset for horizontal segments. A negative offset value shifts the rings inside the area, while a positive offset value shifts the rings outside the area.

By default, both the *x-* and *y*-offset is 0.

-layers {h_segment_layer_name v_segment_layer_name}

Specifies the metal layers on which horizontal and vertical segments of rings are created. By default, the segments are assigned to the lowest metal layers in the design having the corresponding preferred direction.

-width {width_of_h_segments width_of_v_segments}

Specifies the width of the horizontal and vertical ring segments. The minimum and maximum widths specified in the technology file override these settings. If the specified width is less than the minimum width specified in the technology file, the tool uses the minimum width from the technology file. If the specified width is greater than the maximum width specified in the technology file, the tool uses the maximum width from the technology file. By default, the width is set to the minimum width of the metal layer, as specified in the technology file.

-space {space_between_h_segments space_between_v_segments}

Specifies the minimum spacing between horizontal ring segments and the minimum spacing between vertical ring segments. If the specified spacing is less than the minimum spacing defined in the technology file, the tool uses the minimum spacing from the technology file.

By default, the values are set to the corresponding minimum spacing defined in the technology file.

-exclude_instances {collection_of_macro_cells}

Specifies the macro cell instances to be excluded from the rings. If an instance boundary intersects at least one ring when extended by the values of the **-extension_of_excluded_instances** option, the rings are detoured to leave that instance outside the ring. By default, no instances are excluded.

```

-extension_of_excluded_instances {x_extension y_extension}
    Specifies the values by which the boundaries of the instances specified in
    the -exclude_instances option are extended. By default, the instance
    boundaries are not extended.

-max_deviation distance
    Specifies maximum deviation of rings location from their "ideal" location
    (the location as specified by all other options). The deviations can be
    necessary to avoid DRC violations.

-create_bridges {offset space}
    Controls the creation of bridges between neighboring rings of the same net.
    A bridge is a single segment connecting neighboring segments of rings. It is
    located on the same layer and has the same width as the connected segments.
    In general, bridges are required if it is impossible to create a single ring
    because of maximum metal width restrictions defined in the technology file.
    If the bridges connect vertical segments of rings, the offset value specifies
    the offset of the bottom edge of the first bridge from the bottom edge of a
    segment of the inner ring. If the bridges connect horizontal segments of
    rings, the offset value specifies an offset of the left edge of the first
    bridge from the left edge of a segment of the inner ring. The space value
    specifies the distance between bridges. If this value does not correspond to
    requirements of the technology file, it is adjusted automatically. By
    default, no bridges are created.

-ignore_parallel_targets
    Keeps a ring segment from connecting passing targets if the targets are
    parallel to the segment. A target refers to an object of the same net located
    under or over the segment. By default, each ring segment connects all passing
    targets.

-undo
    Removes the rings created by the last create_rectilinear_rings run. This
    option is mutually exclusive with all other options.

```

DESCRIPTION

This command creates rectilinear rings in the design. You can create rings either around the core area or around macro cell instances. By using the options, you can control the location of the rings and the width and layers of their segments. The main difference between this command and the **create_rectangular_rings** command is that you can specify a list of macro cell instances that are excluded from the ring.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates rectilinear rings for the VSS and VDD nets. Rings are created around a core area with offsets of X = 2.08, Y = 3.56. All segments of the ring are located on the PM layer. All segments have a width of 30.0. The spacing

between rings is selected automatically. The analog_01 macro cell is excluded from the rings. The maximum allowed deviation of the rings location is 12. No vias are dropped from the rings to parallel targets.

```
prompt> create_rectilinear_rings \
-nets {VSS VDD} \
-offset {2.08 3.56} \
-layers {PM PM} \
-width {30.0 30.0} \
-exclude_instances analog_01 \
-extension_of_excluded_instances {2 3.01} \
-max_deviation 12 \
-ignore_parallel_targets
```

The following example creates seven rectilinear rings for the VSS net. Rings are created around a core area with offsets of X = 17.08, Y = 18.56. All segments of the ring are located on the M7 layer. All segments have a width of 4.5. The spacing between rings is 1.5. Bridges between rings are created without an offset and spacing between them of 6.0. The analog_01 macro cell is excluded from the rings. The maximum allowed deviation of the ring location is 12. No vias are dropped from the rings to parallel targets.

```
prompt> create_rectilinear_rings \
-nets {VSS VSS VSS VSS VSS VSS VSS} \
-offset {17.08 18.56} \
-layers {M7 M7} \
-width {4.5 4.5} \
-space {1.5 1.5} \
-create_bridges {0 6} \
-exclude_instances {analog_01} \
-extension_of_excluded_instances {4.0 4.0} \
-max_deviation 12 \
-ignore_parallel_targets
```

SEE ALSO

create_route_guide

Creates a new route guide.

SYNTAX

```
object create_route_guide
-coordinate rect
[-no_signal_layers string]
[-no_preroute_layers string]
[-preferred_direction_only_layers string]
[-zero_min_spacing]
[-repair_as_single_sbox]
[-horizontal_track_utilization int_range]
[-vertical_track_utilization int_range]
[-switch_preferred_direction]
[-name string]
```

ARGUMENTS

```
-coordinate rect
    Specifies the coordinates of the bounding box of the route guide.

-no_signal_layers string
    Specifies the layers that cannot contain signals.

-no_preroute_layers string
    Specifies the layers that cannot contain preroutes.

-preferred_direction_only_layers string
    Specifies the layers that cannot make nonPreferredDirection wire.

-zero_min_spacing
    Specifies whether zero minimum spacing is allowed for the route guide.

-repair_as_single_sbox
    Specifies whether this route guide should be repaired as a single sbox when
    there is a difficult violation on a prerouted wire or inside a large macro.

-horizontal_track_utilization int_range
    Specifies the horizontal track utilization for the route guide. If the
    int_range is more than 100, it will be set to 100. The int_range can be set
    from 0 to 1000.

-vertical_track_utilization int_range
    Specifies the vertical track utilization for the route guide. If the
    int_range is more than 100, it will be set to 100. The int_range can be set
    from 0 to 1000.

-switch_preferred_direction
    Specifies whether to switch the preferred direction for the route guide.
```

```
-name string  
      Specifies the name of the route guide to be created.
```

RETURNS

```
object  
      created object
```

DESCRIPTION

This command creates a new route guide.

NOTES

Snapping of the bounding box is done automatically using the global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a route guide.

```
prompt> create_route_guide -coordinate {0.0 0.0 100.0 100.0} \  
-no_signal_layers M1 -no_preroute_layers M2 \  
-preferred_direction_only_layers M4 \  
-horizontal_track_utilization 50 -vertical_track_utilization 30
```

SEE ALSO

```
create_net_shape(2)  
create_user_shape(2)  
create_placement_blockage(2)  
create_via(2)  
create_terminal(2)  
create_text(2)
```

create_routing_blockage

Creates a new routing blockage on metal or via routing blockage layers.

SYNTAX

```
collection create_routing_blockage
-layers layer_list
-bbox | -boundary {polygon_boundary_points}
```

Data Types

<i>layer_list</i>	list of layers
<i>bounding_box</i>	lower left and upper right coordinates
<i>polygon_boundary_points</i>	list of coordinates

ARGUMENTS

-layers *layer_list*

Specifies the layers in which the routing blockage is located. If you specify more than one layer, the tool creates multiple routing blockages simultaneously.

The valid value are: metal1Blockage-metal15Blockage, via1Blockage-via14Blockage, polyBlockage, and polyContBlockage.

This is a required option.

-bbox {*bounding_box*}

Specifies the the bounding box of a rectangular routing blockage. The format of the bounding box specification is {{*llx lly*} {*urx ury*}}, which specifies the lower-left and upper-right corners of the rectangle.

The unit for the coordinates is the unit specified in the technology file. This option and the **-boundary** option are mutually exclusive. You must specify one of these options.

-boundary {*polygon_boundary_points*}

Specifies the boundary points of a rectilinear routing blockage. The format of the boundary specification is {{*x1 y1*} {*x2 y2*} ... {*xn yn*}}.

The unit for the coordinates is the unit specified in the technology file. This option and the **-bbox** option are mutually exclusive. You must specify one of these options.

DESCRIPTION

The **create_routing_blockage** command creates metal or via routing blockages on the metal, via, or poly blockage layers. Unlike route guides, which direct the router to change routing information on nets that go through a route guide, routing blockages direct the router to avoid routing through these areas.

You can create either rectangular routing blockages by using the **-bbox** option or rectilinear routing blockages by using the **-boundary** option.

When the tool creates routing blockages, it automatically assigns a name of

`RB_object_id` to each routing blockage.

EXAMPLES

The following example creates a rectangular via routing blockage in the current design.

```
prompt> create_routing_blockage -layers via5Blockage \
-bbox {{0 0} {100 100}}
{RB_29440}
```

The following example creates two rectilinear metal routing blockages in the current design.

```
prompt> create_routing_blockage -layers {metal13Blockage via4Blockage} \
-boundary {{0 0} {50 0} {50 50} {100 50} {100 100} {0 100}}
{RB_29696 RB_29697}
```

The following example creates a rectangular metal routing blockage in the current design on each metal blockage layer in the design library: prompt>
create_routing_blockage \ -layers [get_layers -include_system -filter
{name=~metal*Blockage}] \ -bbox {{0 0} {50 50}} {RB_29441 RB_29442 RB_29443 RB_29444
RB_29445 RB_29446 RB_29447 RB_29448 RB_29449 RB_29450 RB_29451 RB_29452 RB_29453
RB_29454 RB_29455}

SEE ALSO

`get_layers(2)`
`get_routing_blockages(2)`
`remove_routing_blockage(2)`

create_rp_group

Creates relative placement groups.

SYNTAX

```
collection create_rp_group
group_list
[-design design_name]
[-columns num_cols]
[-rows num_rows]
[-alignment bottom-left | bottom-pin | bottom-right]
[-pin_align_name pin_name]
[-utilization percentage]
[-ignore]
[-x_offset float]
[-y_offset float]
[-compress]
[-cts_option fixed_placement | size_only]
[-route_opt_option fixed_placement | in_place_size_only]
[-psynopt_option fixed_placement | size_only]
[-move_effort low | medium | high]
[-allow_keepout_over_tapcell false | true]
```

Data Types

<i>group_list</i>	list
<i>design_name</i>	design
<i>num_cols</i>	integer
<i>num_rows</i>	integer
<i>pin_name</i>	string
<i>percentage</i>	float
<i>float</i>	percentage

ARGUMENTS

group_list

Specifies the names for the relative placement (RP) groups you want to create in the specified design. Within a design, each group name must be unique. The tool generates a warning if you try to create a group that does not have a unique name.

The **create_rp_group** command creates one relative placement group for each item in the *group_list*.

-design design_name

Specifies the name of the design in which to create the new groups. If you do not specify a value for this option, the groups are created in the current design.

-columns num_cols

Specifies the number of columns into which objects can subsequently be placed, relative to each other.

If you do not specify a value for this option, the group is created with 1

column.

-rows num_rows
 Specifies the number of rows into which objects can be subsequently placed, relative to each other.
 If you do not specify a value for this option, the group is created with 1 row.

-alignment bottom-left | bottom-pin | bottom-right
 Specifies the default alignment method to use when placing leaf cells and relative placement groups in the specified relative placement groups. If you do not specify this option, the tool uses bottom-left alignment.
 You can override the default alignment method for a specific leaf cell or relative placement group when you add it to a relative placement group (by using the **add_to_rp_group** command).

-pin_align_name pin_name
 Specifies the default alignment pin for the created relative placement groups. During placement, the tool uses the alignment pin's location to align the cells within a column.
 You can override the alignment pin for a specific leaf cell when you add the cell to the group (by using the **add_to_rp_group** command).

-utilization percentage
 Specifies the utilization percentage to use for placement of this relative placement group. Utilization is represented as a floating-point number between 0.0 (representing 0%) and 1.0 (the default, representing 100%).

-ignore
 Indicates that the tool is to ignore this relative placement group during placement and not treat it as a relative placement group. Instead, the tool places all of the group's parts individually, as it would normally do when there is no relative placement.

-origin

-x_offset float
 Specifies a left coordinate (anchor) for the group, in microns, relative to the lower-left corner in the core area, for top level relative placement group. It is ignored for a sub-level relative placement group. Specifying only an x-offset allows the group to slide in the y-direction.

-y_offset float
 Specifies a lower coordinate (anchor) for the group, in microns, relative to the lower-left corner in the core area, for top level relative placement group. It is ignored for a sub-level relative placement group. Specifying only a y-offset allows the group to slide in the x-direction.

-compress
 Applies compression in the horizontal direction to a relative placement group during placement. Setting this option places each row of a relative placement group without any gaps between leaf cells, lower-level hierarchical relative placement groups, or keepouts. Column alignment is not maintained when you use **-compress**.
 If you use **-alignment bottom-right** or **-alignment bottom-pin** and specify **-compress**, the tool generates an error and does not create relative placement

groups.

If both **-utilization** and **-compress** are specified, the utilization constraints are observed with gaps between leaf elements in a relative placement row. The **-compress** option does not propagate from a parent group to child groups.

-cts_option fixed_placement | size_only

Specifies how to treat the cells in the relative placement group during clock tree synthesis and clock tree optimization.

If you specify **fixed_placement**, the cells in the relative placement group are treated as fixed during **compile_clock_tree**, **optimize_clock_tree**, and **clock_opt** actions and cannot be sized or moved.

If you specify **size_only**, the cells in the relative placement group can only be sized. This option is applicable to the **compile_clock_tree**, **optimize_clock_tree**, and **clock_opt** commands.

The default value of the option is **fixed_placement**.

This option applies only to top-level relative placement groups and is ignored for hierarchical relative placement groups. The top-level value is propagated to the hierarchical relative placement groups.

-route_opt_option fixed_placement | in_place_size_only

Specifies how to treat the cells in the relative placement group during **route_opt** and **psynopt on_route** activity.

If you specify **fixed_placement**, the cells in the relative placement group are treated as fixed during **route_opt** and **psynopt on_route** activity and cannot be sized or moved.

If you specify **in_place_size_only**, sizing changes are constrained for minimal engineering change order (ECO) placement changes. For example, a cell is sized to improve timing or design rule costs only if the newly-sized cell can fit into any available space adjacent to the original cell location. The resulting transformation is verified to ensure it is legal.

The default value of the option is **in_place_size_only**.

This option applies only to top-level relative placement groups and is ignored for hierarchical relative placement groups. The top-level value is propagated to the hierarchical relative placement groups.

-psynopt_option fixed_placement | size_only

Specifies how to treat the cells in the relative placement group during **psynopt** and **place_opt**.

If you specify **fixed_placement**, the cells in the relative placement group are treated as fixed during **psynopt** and cannot be sized or moved. This value is not recommended for **place_opt**.

If you specify **size_only**, the cells in the relative placement group can only be sized.

The default value of the option is **size_only**.

This option applies only to top-level relative placement groups and is ignored for hierarchical relative placement groups. The top-level value is propagated to the hierarchical relative placement groups.

-move_effort low | medium | high

Controls the extent to which a relative placement group can be moved from its initial location to preserve the relative placement without violating relative placement constraints. The size of the region searched for placement of a relative placement group is progressively reduced as you reduce the effort from high to medium to low.

Coarse placement estimates an initial location for every top-level relative

placement group. If those groups are placed at the same locations returned by coarse placement, the relative placement groups might need to be broken, which would violate the relative placement constraints for those groups. Specifying high effort allows the higher movement of a relative placement group from its initial location in search of a location compared to low and medium effort, to maintain the relative placement constraints and potentially avoid breaking the relative placement group. The tradeoff for maintaining the relative placement group is a potential loss of QoR, because the group is moved from the location initially determined by coarse placement. Specifying low effort indicates that the relative placement group is placed as close as possible to the initial location returned by coarse placement. The tradeoff for maintaining the location is a higher potential for breaking the relative placement groups and violating the relative placement constraints for some relative placement groups.

By default, the tool uses medium effort.

`-allow_keepout_over_tapcell false | true`

Specifies that the hard keepout in the relative placement group should be overlapped with tap cells if needed. By default, the value is false.

`-compression`

DESCRIPTION

The **create_rp_group** command creates new relative placement groups. The new groups are created empty and contain no items. Add items to a group using the **add_to_rp_group** command. Remove groups using the **remove_rp_groups** command.

Persistently store and restore relative placement groups with the **write_milkyway** command and the **read_milkyway** command.

This command returns a collection containing the relative placement groups that are created. If no objects are created, the empty string is returned.

Relative placement groups provide for explicit user control of placement for a group of cells. A relative placement group is placed as a whole while maintaining the relative placement (or tiling) of the cells within the group as specified with the **add_to_rp_group** command. Relative placement is also known as "structured placement."

When placing a relative placement group, the placer automatically chooses the orientation for the group. For example, if the placer chooses the north orientation for a relative placement group, the first column of that relative placement group is placed at the left and subsequent columns are placed towards the right. If the placer chooses the flip-north orientation for a relative placement group, the first column of that relative placement group is placed at the right and subsequent columns are placed towards the left.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **create_rp_group** to create a relative placement group:

```
prompt> create_rp_group grp_ripple -design ripple -rows 8
{ripple::grp_ripple}

prompt> get_rp_groups grp_ripple
{ripple::grp_ripple}

prompt> add_to_rp_group *ripple -leaf carry_in_1 -row 2
{ripple::grp_ripple}
```

SEE ALSO

`add_to_rp_group(2)`
`all_rp_groups(2)`
`remove_rp_groups(2)`
`report_rp_group_options(2)`
`set_rp_group_options(2)`
`write_rp_groups(2)`

create_scenario

Creates a scenario in memory.

SYNTAX

```
status create_scenario
scenario_name
```

Data Types

```
scenario_name      string
```

ARGUMENTS

```
scenario_name
    Specifies the name of the scenario created. A scenario_name must be unique
    within the current session.
```

DESCRIPTION

Creates a new scenario in memory. The newly created scenario has no scenario-specific constraints.

Multicorner-Multimode Support

This command supports an option to specify which active scenarios it should work with.

EXAMPLES

The following example uses **create_scenario** to create a scenario.

```
prompt> create_scenario MODE1
prompt> all_scenarios
```

SEE ALSO

```
all_scenarios(2)
all_active_scenarios(2)
set_active_scenarios(2)
current_scenario(2)
remove_scenario(2)
create_scenario(2)
```

create_short_drc_error

Creates an error record of an error type in the "Short" type class.

SYNTAX

```
collection create_short_drc_error
-type error_type
-bbox {llx lly urx ury}
[-status error_status]
[-info description]
[-net1 net]
[-net2 net]
[-layer layer]
[-error_view mw_error_view]
```

Data Types

<i>error_type</i>	string
<i>error_status</i>	string
<i>description</i>	string
<i>net</i>	list or collection
<i>layer</i>	list or collection
<i>mw_error_view</i>	list or collection

ARGUMENTS

```
-type error_type
      An error type id or name of the new error object. The given type must be in
      the "Short" type class. This argument is required.

-bbox {llx lly urx ury}
      The bounding box of the shorted area. This argument is required.

-status error_status
      The current status of this error. Must be one of {Error, Fixed, Ignored,
      Waived}. If omitted, it is set to "Error."

-info description
      A full description of this error. If omitted, left empty.

-net1 net
      The first shorted net as a collection of id or name, if any.

-net2 net
      The second shorted net as a collection of id or name, if any.

-layer layer
      The associated layer as a collection of id or name, if any.

-error_view mw_error_view
      The error view in which to create the error record. If omitted, the error
      record will be created in the current top-level design cell. Specifying more
```

than one error view causes an error.

DESCRIPTION

This command creates a new error object of the given type in the type class "Short". Every error object must be associated with one and only one error type. The error type association for an error object is made when the error object is created and is immutable. The error type association with a type class is made when the error type is created and is immutable. Therefore, an error type in the "Short" type class must be first created before error objects of a "Short" type class can be created.

The command returns a collection with the new error object if successful.

An error type in the "Short" type class is for violations where routed shapes overlap in the same area in a layer. Therefore, the error object requires a bounding box for the shorted area. Optionally, a description, two nets and a layer can be added to fully describe the violation.

EXAMPLES

The following example opens an error view named "mydesign_idrc.err" and creates an error type named "Short", then creates an error record of the type:

```
prompt> set cellId [open_mw_cel -not_as_current mydesign_idrc.err]
{mydesign_idrc}
prompt> set typeId [create_drc_error_type -name Short -class Short -
error_view $cellId
1024
prompt> create_drc_error -type $typeId -error_view $cellId \
    -bbox {574.0700 430.3600 578.9700 433.4400} \
    -net1 [get_nets myNetA] -net2 [get_nets myNetB] \
    -layer [get_layers layerA]
{1280}
```

SEE ALSO

[create_drc_error_type\(2\)](#)
[list_drc_error_types\(2\)](#)
[report_drc_error_type\(2\)](#)
[get_drc_errors\(2\)](#)
[remove_drc_error\(2\)](#)

create_site_row

Creates a row of sites.

SYNTAX

```
collection create_site_row
-coordinate {X Y}
[-name row_name]
-kind site_type
-space space
-count site_count
[-orient orientation]
[-dir direction]
```

Data Types

<i>row_name</i>	string
<i>site_type</i>	string
<i>space</i>	string
<i>site_count</i>	integer
<i>direction</i>	string

ARGUMENTS

```
-coordinate {X Y}
    Specifies the lower-left corner of the row, regardless of the orientation.
    The values are specified in microns relative to the chip origin.

-name row_name
    Specifies the name of the site row, such as ROW1, ROW2, and so forth. If a
    row name is not specified, the tool names the newly created site row.

-kind site_type
    Specifies the type of site being defined.

-space space
    Specifies the space for each site, from the lower-left corner of the site to
    the lower-left corner of the next site. The value is specified in microns.

-count site_count
    Specifies the number of sites in the row.

-orient orientation
    Specifies the orientation of sites. The following values are allowed:
        0
        90
        180
        270
        0-mirror
        90-mirror
        180-mirror
```

270-mirror

Alternatively, you can use the following values:

N
W
S
E
FN
FW
FS
FE

The default value is either **0** or **N**.

-dir direction

Specifies the direction of the row. The following values are allowed:

h
v
horizontal
vertical
VERTICAL
HORIZONTAL
V
H

The default value is **horizontal**.

DESCRIPTION

The **create_site_row** command creates a row of sites at the specified location.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command creates a horizontal row of 3 sites spaced by 5 units, and originating at {10,10}:

```
prompt> create_site_row -coordinate {10,10} -kind CORE -space 5 -count 3
{SITE_ROW#12345}
```

SEE ALSO

`get_site_rows(2)`
`ignore_site_row(2)`
`remove_row_type(2)`
`remove_site_row(2)`
`set_row_type(2)`

create_spacing_drc_error

Creates an error record of an error type in the "Spacing" type class.

SYNTAX

```
collection create_spacing_drc_error
-type error_type
-bbox {llx lly urx ury}
[-status error_status]
[-info description]
[-direction direction]
[-net1 net]
[-net2 net]
[-layer layer]
[-error_view mw_error_view]
```

Data Types

<i>error_type</i>	string
<i>error_status</i>	string
<i>description</i>	string
<i>direction</i>	string
<i>net</i>	list or collection
<i>layer</i>	list or collection
<i>mw_error_view</i>	list or collection

ARGUMENTS

```
-type error_type
      An error type id or name of the new error object. The given type must be in
      the "Spacing" type class. This argument is required.

-bbox {llx lly urx ury}
      The bounding box describing the spacing error. This argument is required.

-status error_status
      The current status of this error. Must be one of {Error, Fixed, Ignored,
      Waived}. If omitted, it is set to "Error."

-info description
      A full description of this error. If omitted, left empty.

-direction direction
      This argument indicates the direction of the spacing violation. The value
      must be one of {horizontal, vertical, llToUr, ulToLr}. The direction
      determines the way in which the violation is rendered graphically. If
      horizontal, parallel vertical lines are drawing with a double ended
      horizontal arrow between them. If vertical, this is rotated 90 degrees. If
      llToUr, a double ended arrow is drawn from lower right to upper right corner.
      If ulToLr, this is rotated 90 degrees.
```

```

-net1 net
    The first net involved in the spacing violation as a collection of id or name,
    if any.

-net2 net
    The second net involved in the spacing violation as a collection of id or
    name, if any.

-layer layer
    The associated layer as a collection of id or name, if any.

-error_view mw_error_view
    The error view in which to create the error record. If omitted, the error
    record will be created in the current top-level design cell. Specifying more
    than one error view causes an error.

```

DESCRIPTION

This command creates a new error object of the given type in the type class "Spacing". Every error object must be associated with one and only one error type. The error type association for an error object is made when the error object is created and is immutable. The error type association with a type class is made when the error type is created and is immutable. Therefore, error type in the "Spacing" type class must be first created before error objects of a "Spacing" type class can be created.

The command returns a collection with the new error object if successful.

An error type in the "Spacing" type class is for violations where two routed shapes in the same layer violate a spacing rule. A bounding box is sufficient to describe the distance which violated the spacing rule. If a direction is provided, the error browser will render the violation with parallel lines and directed arrows which provides a richer depiction. Optionally, a description, two nets and a layer can be added to fully describe the violation.

EXAMPLES

The following example opens an error view named "mydesign_idrc.err" and creates an error type named "Via Spacing", then creates an error record of the type:

```

prompt> set cellId [open_mw_cel -not_as_current mydesign_idrc.err]
{mydesign_idrc}
prompt> set typeId [create_drc_error_type -name "Via Spacing" -class Spacing \
    -info "minimum spacing = 0.22 um" -error_view $cellId]
1024
prompt> create_spacing_drc_error -type $typeId -error_view $cellId \
    -bbox {574.0700 430.3600 578.9700 433.4400} \
    -direction horizontal
{1280}

```

SEE ALSO

`create_drc_error_type(2)`

```

remove_drc_error(2)
```

create_spacing_drc_error
556

create_stack_via_on_pad_pin

create stack vias from pad layer to top layer for flip-chip drivers.

SYNTAX

```
status create_stack_via_on_pad_pin
-from_metal mX | MX | tech_layer_number
-to_metal mX | MX | tech_layer_number
[-remove_existing_stack_via bool]
[-route_type user_enter | signal_route]
```

DATA TYPES

mX string
MX string
tech_layer_number integer

ARGUMENTS

```
-from_metal mX | MX | tech_layer_number
    Specify the pad_layer technology layer number. mX/MX mean strings from m1/M1
    to m15/M15. This option must be set.

-to_metal mX | MX | tech_layer_number
    Specify the top_layer technology layer number mX/MX mean strings from m1/M1
    to m15/M15. This option must be set.

-remove_existing_stack_via bool
    The default value is Off.

-route_type user_enter | signal_route
    Specify the stack-vias route type. The default value is "signal_route"
```

DESCRIPTION

This command creates stack-vias on flip-chip drivers from the pad pin to the top metal layer. If there has existed stack-vias on flip-chip drivers, it will not remove the original stack-vias unless the option **-remove_existing_stack_via** is On. The behaviors of this command are as follows: Follow the var-rule width and spacing setting to create square vias or via arrays. If the vias are across the pad pin bbox or design boundary, then cut it with pad pin bbox or design boundary. (may become rectangular vias) If there still exists DRC of cross design boundary on stack-vias, it shows warning messages and the stack-vias are created.

EXAMPLES

1. `create_stack_via_on_pad_pin` applies "`-layer_width`" as via width, so users can execute the following command to set via-width as 10 and via-spacing as 2 (micron) :

```
prompt> set_route_flip_chip_options -rule_name rdlRule -target_net_file bumpnet \
      -layer_spacing {m8 2, m7 2, m6 2, m5 2, m4 2} \
      -layer_width {m8 10, m7 10, m6 10, m5 10, m4 10} \
prompt> create_stack_via_on_pad_pin -from_metal m4 -to_metal M8
```

or

```
prompt> create_stack_via_on_pad_pin -from_metal 65 -to_metal 57
```

SEE ALSO

```
set_route_flip_chip_options(2)
route_flip_chip(2)
create_stack_via_on_pad_pin(2)
write_flip_chip_nets(2)
push_flip_chip_route(2)
display_flip_chip_route_flylines(2)
optimize_flip_chip_route(2)
```

create_supply_net

Creates a supply net for the specified power domain. The supply net is created in the logic hierarchy at the same scope as the specified power domain. This command is supported only in UPF mode.

SYNTAX

```
string create_supply_net
supply_net_name
-domain domain_name
[-reuse]
[-resolve unresolved | parallel]
```

Data Types

<i>supply_net_name</i>	string
<i>domain_name</i>	string

ARGUMENTS

supply_net_name

Specifies the name of the supply net to be created. The name should be a simple (non-hierarchical) name.

In the scope of specified power domain, if there is a supply net, logical hierarchical net, or logical port with the same name, the supply net cannot be created. An exception to this rule is when you use the **-reuse** option. In this case the net name must be same as an existing supply net in the same scope; name; check is not performed.

This argument is required.

-domain domain_name

Specifies the power domain for which this supply net is defined. The power domain must exist.

This argument is required.

-reuse

Reuses an existing supply net instead of creating a new one. One supply net can be associated with several power domains. If this option is used, the specified supply net must already exist.

-resolve unresolved | parallel

Specifies how the state and voltage of the supply net are resolved when the supply net is driven by a power switch or multiple power switches. Specifying *unresolved* means that this supply net allows only a single driver. Specifying *parallel* means that this supply net can be driven by multiple power switches. When the supply net is connected to the output of multiple power switches, any number of outputs may be ON at the same time, as long as the voltage value is same.

The default is **unresolved**.

You cannot use both **-resolve** and **-reuse** options in the same **create_supply_net** command.

DESCRIPTION

The **create_supply_net** command enables you to create a supply net defined in the specified power domain. A supply net presents the intention of the power supply in the power domains. A supply net connects supply ports and, or pins.

Each power domain has a primary power supply net and a primary ground supply net, and could have several other supply nets. If the command succeeds, a supply net is created in the scope of the power domain. The new supply net is neither a primary power net nor a primary ground net of the power domain. Use the **set_domain_supply_net** command to set the supply net as the primary power or ground net.

On success this command returns the full name of the supply net (from the current scope). On failure, it returns a null string.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a supply net named A_VDD in the power domain PD1, and recreates supply net A_DD in the power domain PD2 using the **-reuse** option:

```
prompt> create_power_domain PD1 -element INST1
PD1

prompt> create_power_domain PD2 -element INST2
PD2

prompt> create_supply_net A_VDD -domain PD1
A_VDD

prompt> create_supply_net A_VDD -domain PD2 -reuse
A_VDD
```

SEE ALSO

`report_supply_net(2)`

create_supply_port

Creates a supply port in the specified power domain or in the current scope if no power domain is specified. This command is supported only in UPF mode.

SYNTAX

```
string create_supply_port
supply_port_name
[-domain domain_name]
[-direction in | out]
```

Data Types

<i>supply_port_name</i>	string
<i>domain_name</i>	string

ARGUMENTS

supply_port_name

Specifies the name of the supply port to be created. The name should be either a simple (non-hierarchical) name if **-domain** is specified, or a full (hierarchical) name if **-domain** is not specified.

In the scope of the specified power domain, if there is a supply port, logical port, or logical hierarchical net with the same name, the supply port cannot be created.

This argument is required.

-domain *domain_name*

Specifies the power domain where this port defines a supply net connection point. If the specified power domain does not exist in the current scope, the command fails.

-direction in | out

Defines how state information is propagated through the supply network as it is connected to the port. If the port is an input port, the state information of the external supply net connected to the port shall be propagated into the domain. Likewise, for an output port, the state information of the internal supply net connected to the port shall be propagated outside of the domain. The default value for this option is in.

DESCRIPTION

The *create_supply_port* command enables you to create a supply port at the scope of the specified power_domain or at the current scope. A supply port provides a connection point for the supply net.

This command returns the full name of the supply port (from the current scope) upon success. The command returns a null string if it fails.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates the supply port VN1 at the scope of power domain PD1:

```
prompt> create_power_domain PD1 -element INST1
PD1

prompt> create_supply_port VN1 -domain PD1
VN1
```

SEE ALSO

`remove_supply_port(2)`
`report_supply_port(2)`

create_terminal

Creates a new terminal for a logical port.

SYNTAX

```
terminal create_terminal
{-bbox rect | -boundary boundary}
-layer layer
-port string
[-direction {left | right | up | down}]
[-name string]
```

ARGUMENTS

-bbox rect
Specifies the bounding box of the terminal.
This option cannot be combined with the *-boundary* option.

-boundary boundary
Specifies the rectilinear boundary of the terminal.
This option cannot be combined with the *-bbox* option.

-layer layer
Specifies the layer of the terminal.

-port string
Specifies the name of the associated logical port of the terminal.

-direction {left | right | up | down}
Specifies a list of allowable access directions for the terminal.
Valid values are: left, right, up or down.
If not supplied no access direction is assumed.

-name string
Specifies the name of the created terminal
If no name is specified then one is automatically generated from the port name.
Note: It is recommended that no name is specified, so the automatically generated name is used, as some operations require that the terminal name conforms to terminal naming conventions (See below).
If the specified terminal name does not match terminal naming conventions a warning will be issued.

RETURNS

terminal
The created terminal.

DESCRIPTION

This command creates a new terminal for a logical port.

Terminals have a layer, a set of access directions and a boundary that can be a simple rectangle or a rectilinear shape.

The name of a terminal is expected, but not required, to obey certain naming conventions. The convention is for a terminal's name to be the same as the port name. For EQ pins, where there are multiple terminals associated with the same port, the first terminal has the same name as the port and subsequent terminal names have the format '<port_name> <number>' where '<port_name>' is the port name and '<number>' is a unique number which, when automatically generated, will start from one and increment for each new terminal on that port.

NOTES

Snapping of the bounding box or boundary is done automatically using global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a terminal for port A1

```
rompt> create_terminal -bbox {0 0 10 10} -port A1 -layer M3
```

SEE ALSO

```
create_net_shape(2)
create_user_shape(2)
create_placement_blockage(2)
create_route_guide(2)
create_via(2)
create_text(2)
```

create_text

Creates a new text.

SYNTAX

```
object create_text
-origin {x_y}
[-height height]
[-layer layer_name]
[-orient orient_type]
[-anchor text_anchor]
text
```

Data Types

<i>height</i>	real
<i>layer_name</i>	layer
<i>orient_type</i>	string
<i>text_anchor</i>	string
<i>text</i>	string

ARGUMENTS

-origin {x_y}

Specifies text origin.

Replace *x* and *y* with the coordinates of the point of origin.

-height height

Specifies text height.

By default, the *height* value is taken from the **mw_text_height** global variable.

-layer layer_name

Specifies the text layer.

By default, the *layer_name* value is taken from the **mw_text_layer** global variable.

-orient orient_type

Specifies the orientation of the text using either Design Exchange Format (DEF) or Floorplan Compiler notation.

The valid values are as follows:

N, W, S, E, FN, FS, FE, FW

NW, NE, EN, ES, SE, SW, WN, WS

0, 90, 180, 270, 0-mirror, 90-mirror,

180-mirror, 270-mirror

The following groups of values are synonymous:

N, NE, 0

W, WN, 90

S, SW, 180

E, ES, 270

FN, NW, 0-mirror

```
FS, SE, 180-mirror
FE, EN, 270-mirror
FW, WS, 90-mirror
The default is N.
```

```
-anchor text_anchor
Specifies the anchor position for text from the origin.
The valid values and their descriptions are as follows:
lb - Left Bottom
cb - Center Bottom
rb - Right Bottom
lc - Left Center
c - Center Center
rc - Right Center
lt - Left Top
ct - Center Top
rt - Right Top
The default is lb.
```

```
text
Specifies the text string to create and display.
```

RETURNS

```
object
The created object
```

DESCRIPTION

This command creates a new text.

Snapping of the origin is automatically done by using global snap settings.

Note: The object returned by the command is the object created.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a text string at origin coordinates {10 10}.

```
prompt> create_text -origin {10 10} -text Hello
```

SEE ALSO

```

create_terminal(2)
```

[create_text](#)

```
create_user_shape(2)
create_via(2)
```

create_track

Creates the tracks for a routing layer or a poly layer.

SYNTAX

```
int create_track
-layer layer
[-space track_pitch]
[-count number_of_tracks]
[-coord start_x_or_y]
[-dir X | Y]
[-bounding_box track_boundary_box]
```

Data Types

<i>layer</i>	string
<i>track_pitch</i>	float
<i>number_of_tracks</i>	integer
<i>start_x_or_y</i>	float
<i>track_boundary_box</i>	rectangle

ARGUMENTS

```
-layer layer
    Specifies the layer to use the tracks. You can use layer name, layer number,
    or a collection containing one layer object.

-space track_pitch
    Specifies the pitch distance between each track. The pitch is the center-to-
    center distance between two routing wires (the routing wire route on top of
    each track). By default, the distance is the same as the routing pitch from
    the physical library. The pitch distance's unit is specified in technology
    file (usually it is micron).

-count number_of_tracks
    Specifies how many tracks to create. By default, the tracks use the entire
    die area. If not specify this option, the value will be automatically
    calculated and decided by die area and space.

-coord start_x_or_y
    Specifies the location of the first track. The X and Y coordinates depend on
    the values specified with the -dir option. By default, the track is located
    at half of the space distance inside of the die area. The coordinates, Å unit
    is specified in technology file (usually it is micron).

-dir X | Y
    Specifies the direction how tracks are placed. The valid values are X and Y;
    specify either. By default, the direction is the routing direction of the
    layer, which is specified in the physical library.

-bounding_box track_boundary_box
    Specifies the lower left and upper right coordinates of the boundary box which
```

i ncludes the entire tracks. By default, the boundary box just fits the entire tracks. The coordinates, unit is specified in technology file (usually it is micron).

DESCRIPTION

This command creates a group of tracks on the floorplan so the router can use them to perform detail routing or command **insert_metal_filler** can use them to fill the poly layer at chip finishing step. You must specify either a poly layer or a routing layer for the tracks. The option of creating the track on poly layer is not intended to support routing on poly layer. The tracks can be saved in the Design Exchange Format (DEF) file or the Synopsys database format (Milkyway) file.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates routing tracks for a routing layer named *m3* on the floorplan and reports the newly created routing tracks.

```
prompt> create_track -layer m3
Warning: Space is not specified. Using pitch. (MWUI-124)
Warning: Direction is not specified. Using the layer preferred direction.
(MWUI-125)
Warning: Coordinate value is not specified. Defaulting to the left(bottom)
coordinate of the track's bounding box. (MWUI-126)
Warning: Count value is not specified. Covering the bounding box of track,
depending on its space value. (MWUI-127)

create_user_shape

Creates a new user shape. A user shape is a metal shape that is not associated with a net.

SYNTAX

```
collection create_user_shape
[-type wire | path | trap | rect | poly]
-origin point
| -points list_of_points
| -bbox rect
| -boundary boundary
[-length real]
[-width real]
[-path_type square | round | extend_half_width | octagon]
-layer layer
[-vertical]
[-route_type route_type]
[-datatype int]
[-avoid_short_segment]
```

Data Types

<i>point</i>	<i>point</i>
<i>list_of_points</i>	list of points
<i>rect</i>	rectangle
<i>boundary</i>	polygon
<i>real</i>	real
<i>layer</i>	collection
<i>route_type</i>	string
<i>int</i>	integer

ARGUMENTS

```
-type wire | path | trap | rect | poly
    Specifies the type of the user shape. Valid values are wire, path, trap
    (trapezoid), rect (rectangle), and poly (polygon).
    The default is poly.
```

```
-origin point
    Specifies the origin of the user shape for wires.
    When you specify this option, you must also specify the -length and -width
    options.
    The -origin, -points, -bbox, and -boundary options are mutually exclusive.
    You must specify one of these options.
```

```
-points list_of_points
    Specifies the points of the user shape for paths.
    When you specify this option, you must also specify the -width option.
    The -origin, -points, -bbox, and -boundary options are mutually exclusive.
    You must specify one of these options.
```

-bbox rect
 Specifies the bounding box of the user shape. You must specify the lower-left and upper-right corners of the bounding box by using the following syntax:
 `{{llx lly} {urx ury}}`.
 The **-origin**, **-points**, **-bbox**, and **-boundary** options are mutually exclusive.
 You must specify one of these options.

-boundary boundary
 Specifies the boundary of the user shape. You must specify at least three nonoverlapping points.
 The **-origin**, **-points**, **-bbox**, and **-boundary** options are mutually exclusive.
 You must specify one of these options.

-length real
 Specifies the length of the user shape for wires in user units.

-width real
 Specifies the width of the user shape for wires in user units.
 This option is required when you specify the **-origin** or **-points** option and ignored otherwise.

-path_type square | round | extend_half_width | octagon
 Specifies the alignment type of a wire or path end.
 Possible values are
 square - square, no extension
 round - round, half width extension
 extend_half_width - square, half width extension
 octagon - octagon, half width extension
 The default is **square**.

-layer layer
 Specifies the layer for the user shape. You can specify the layer by using the layer name from the technology file or by using the **get_layers** command.
 This is a required option.

-vertical
 Indicates that the wire is vertical.
 By default, the user shape is horizontal.

-route_type route_type
 Specifies the route type of the user shape.
 Use one of the following route types:

user_enter	User entered
signal_route, signal_route_detail	Detail routing
signal_route_global	Global routing
pg_ring	Power or ground (PG) ring
pg_strap	PG strap
pg_macro_io_pin_conn	PG net that connects to the PG pin of an I/O pad cell or a macro cell
pg_std_cell_pin_conn	PG net that connects to the PG pin of a standard cell
clk_ring	Clock ring
clk_strap	Clock strap
clk_zero_skew_route	Clock zero skew route
bus	Bus

```

shield, shield_fixed           Fixed shield
shield_dynamic                 Dynamic shield
fill_track, clk_fill_track     Fill track
By default, the route type is signal_route.

-datatype int
    Specifies the data type number.
    By default, the data type is 0.

-avoid_short_segment
    Specifies that segments shorter than a half width should be avoided for paths.

```

DESCRIPTION

This command creates a shape object that is not attached to a net and returns a collection containing the created object.

The valid shape types are

```

Wire (horizontal or vertical)
Path
Trapezoid
Rectangle
Polygon

```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a wire user shape.

```

prompt> create_user_shape -type wire \
-origin {0 0} -length 10 -width 2 -layer M1

```

SEE ALSO

```

create_net_shape(2)
create_placement_blockage(2)
create_route_guide(2)
create_via(2)
create_terminal(2)
create_text(2)

```

create_via

Creates a new via.

SYNTAX

```
object create_via
-at point
[-name string]
-master string | -auto
[-net string | -no_net]
[-
route_type route_type | signal_route | signal_route_global | signal_route_detail |
pg_ring | pg_strap | pg_macro_io_pin_conn | pg_std_cell_pin_conn | clk_ring | clk_s
trap | clk_zero_skew_route | bus | shield | shield_dynamic | clk_fill_track]
[-
orient orient | FN | FS | FE | FW | NW | NE | EN | ES | SE | SW | WN | WS | 0 | 90
| 180 | 270 | 0-mirror | 90-mirror | 180-mirror | 270-mirror]
[-type via | via_array | via_cell]
[-row int]
[-col int]
[-x_pitch real]
[-y_pitch real]
[-allow_multiple]
```

ARGUMENTS

-at *point*
Specifies the center of the created via or via array.
This is a required option.

-name *string*
Specifies the optional name of the created via or via array.

-master *string*
Specifies the master name of the via.
This option and the **-auto** option are mutually exclusive; you must specify one of these options.

-auto
Automatically creates a via based on the nearest wire intersection at the specified creation coordinate.
This option automatically sets the **-col**, **-row**, **-x_pitch**, **-y_pitch**, **-master**, and **-net** options.
If you specify values for **-col**, **-row**, **-x_pitch**, or **-y_pitch**, the specified values override the automatic values.
This option and the **-master** option are mutually exclusive; you must specify one of these options.

-net *string*
Specifies the name of the net to connect to the via.
If you use the **-auto** option, you cannot specify this option. If you do not use the **-auto** option, you must specify either this option or the **-no_net**

option.

-no_net

Specifies that no net should be connected to the via.

If you use the **-auto** option, you cannot specify this option. If you do not use the **-auto** option, you must specify either this option or the **-net** option.

-route_type route_type | signal_route | signal_route_global | signal_route_detail | pg_ring | pg_strap | pg_macro_io_pin_conn | pg_std_cell_pin_conn | clk_ring | clk_strap | clk_zero_skew_route | bus | shield | shield_dynamic | clk_fill_track

The route type of the via. One of:

user_enter	User entered
signal_route, signal_route_detail	Detail routing
signal_route_global	Global routing
pg_ring	Power or ground (PG) ring
pg_strap	PG strap
pg_macro_io_pin_conn	PG net that connects to the PG pin of an I/O pad cell or a macro cell
pg_std_cell_pin_conn	PG net that connects to the PG pin of a standard cell
clk_ring	Clock ring
clk_strap	Clock strap
clk_zero_skew_route	Clock zero skew route
bus	Bus
shield, shield_fixed	Fixed shield
shield_dynamic	Dynamic shield
fill_track, clk_fill_track	Fill track

By default, the route type is **signal_route**.

-orient orient | FN | FS | FE | FW | NW | NE | EN | ES | SE | SW | WN | WS | 0 | 90 | 180 | 270 | 0-mirror | 90-mirror | 180-mirror | 270-mirror

Specifies the orientation of the via or via array using either DEF or IC Compiler notation.

The following values are allowed:

N, W, S, E, FN, FS, FE, FW

NW, NE, EN, ES, SE, SW, WN, WS

0, 90, 180, 270, 0-mirror, 90-mirror, 180-mirror, 270-mirror

The following values are synonymous:

N , NE, 0
W , WN, 90
S , SW, 180
E , ES, 270
FN, NW, 0-mirror
FS, SE, 180-mirror
FE, EN, 270-mirror
FW, WS, 90-mirror

By default, the orientation is **N**.

-type via | via_array | via_cell

Specifies which type of via to create. One of:

```

via      Via
via_array Via array
via_cell  Via cell
By default, a via is created, unless you specify another command option that
is specific to via arrays.

-row int
    Specifies the number of via array rows.

-col int
    Specifies the number of via array columns.

-x_pitch real
    Specifies the x-distance between cuts in the via array.

-y_pitch real
    Specifies the y-distance between cuts in the via array.

-allow_multiple
    Allows multiple vias to be created when you use the -auto option.

```

DESCRIPTION

This command creates a new via, via array, or via cell and returns the created object.

Snapping is done automatically by using the global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a via.

```

prompt> create_via -at {100 100} -route_type clk_ring\
-master VIA12 -no_net

```

SEE ALSO

```

create_net_shape(2)
create_user_shape(2)
create_placement_blockage(2)
create_route_guide(2)
create_terminal(2)
create_text(2)

```

create_voltage_area

Creates a voltage area at the specified region for providing placement constraints of cells associated with the region.

SYNTAX

```
int create_voltage_area
modules -name voltage_area_name
    | -power_domain power_domain_name
-coordinate llx1_lly1_urx1_ury1_...
[-guard_band_x guard_band_width]
[-guard_band_y guard_band_width]
[-is_fixed]
[-target_utilization utilization]
[-color string]
[-cycle_color]
```

Data Types

<i>modules</i>	list
<i>voltage_area_name</i>	string
<i>power_domain_name</i>	string
<i>guard_band_width</i>	int
<i>utilization</i>	float
<i>string</i>	power_domain_name

ARGUMENTS

modules

Specifies a list of hierarchical cells that are contained in the voltage area. Multiple hierarchies are permitted, and one cell cannot be in two voltage areas. Leaf cells (or standard cells) cannot be specified in this option. You must specify this option when you specify the **-name** option. You cannot specify this option when you specify the **-power_domain** option.

-name *voltage_area_name*

Specifies the name of the voltage area to be created. If there is a voltage with the same name, the voltage cannot be created. The name *DEFAULT_VA* is reserved and cannot be used for user-defined voltage area. When you specify this option, you must also specify the *modules* argument. This option and the **-power_domain** option are mutually exclusive; specify only one.

-power_domain *power_domain_name*

Creates a voltage area from an existing power domain. The name of the voltage area is identical to the name of the power domain. All hierarchical cells associated with the power domain are included in the voltage area. After the voltage area is successfully created, the power domain contains the corresponding boundary information. You cannot create a voltage area from a top-level power domain.

This option and the **-name** option are mutually exclusive. You must specify either this option or the **-name** option along with the *modules* argument.

-coordinate *llx1_lly1_urx1_ury1*...
 Specifies a list of lower-left and upper-right coordinates of a voltage area. Each set of {llx lly urx ury} defines a target rectangular placement area. The voltage area geometry can be a rectangle or a rectilinear polygon. If this option is not specified, the voltage area will be created outside the chip. This option is used for automatic voltage area shaping.

-guard_band_x *guard_band_width*
 Specifies the guard width in the horizontal direction. The guardband is the spacing along the boundary of the voltage area where cells cannot be placed because of the lack of power supply rails.
 The value specified with this option must be a positive integer.

-guard_band_y *guard_band_width*
 Specifies the guard width in the vertical direction. The guardband is the spacing along the boundary of the voltage area where cells cannot be placed because of the lack of power supply rails.
 The value specified with this option must be a positive integer.

-is_fixed
 Specifies that the voltage area is in a fixed location, and the shaping will ignore it. The default value of this option is false.

-target_utilization *utilization*
 Specifies the utilization required for this voltage area during shaping. The default is the design utilization. The value specified must be between 0.1 and 1.0.

-color *string*
 Specifies the color for the voltage area and its leaf cells. This is used in the GUI. The value can be either a color string such as red, blue, and so on, or it can be a color index which is a number between 0 to 63. Each of these numbers represents a different color for displaying in the GUI, the voltage area and its leaf cells.
 This option and the **-cycle_color** option are mutually exclusive; if you specify both, no color is assigned to the voltage area.

-cycle_color
 Automatically chooses the next color in the color table, and assigns the color to the voltage area and its leaf cells.
 This option and the **-color** option are mutually exclusive; if you specify both, no color is assigned.

DESCRIPTION

The **create_voltage_area** command enables you to create a voltage area of specific geometry on the core area of the chip. The voltage area is associated with hierarchical cells. The placer assumes the voltage area to be an exclusive, hard move bound and tries to place all the cells associated with the voltage area within the geometrical area of the voltage area, as well as place all the cells not associated with the voltage area outside.

Voltage areas can physically be completely nested: one voltage area lies completely inside another voltage area. When considering the area or utilization of outside

voltage area, the area of inner voltage area is excluded.

Voltage areas can also be logically nested: one hierarchical cell belongs to one voltage area, while one of its descents belongs to another voltage area. When considering the utilization, all descents belonging to other voltage areas will be excluded.

Voltage areas cannot be partially overlapped. The creation will fail if you try to create a voltage area partially overlapping with an existing voltage area.

Move bounds can only be completely nested inside voltage areas. Voltage areas cannot be partially overlapping with move bounds, nor it can be completely nested inside move bounds.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example constrains the instance INST_1 to lie within the voltage area whose coordinates are lower-left corner (100 100) and upper-right corner (200 200):

```
prompt> create_voltage_area -name foo \
      -coordinate {100 100 200 200} INST_1
```

The following example creates a voltage area from an existing power domain:

```
prompt> create_voltage_area -power_domain INST \
      -coordinate {215 215 350 350}
```

SEE ALSO

```
remove_voltage_area(2)
report_voltage_area(2)
update_voltage_area(2)
create_bounds(2)
```

create_zrt_shield

Performs automatic shield routing.

SYNTAX

```
status create_zrt_shield
[-mode new | unshield | reshield]
[-nets collection_of_nets]
[-with_ground net_name]
[-ignore_shielding_net_pins true | false]
[-ignore_shielding_net_rails true | false]
[-coaxial_below true | false]
[-coaxial_above true | false]
[-coaxial_below_skip_tracks number_of_tracks]
[-coaxial_above_skip_tracks number_of_tracks]
[-pg_via_tie_effort_level low | medium | high]
```

Data Types

<i>collection_of_nets</i>	collection
<i>net_name</i>	string
<i>number_of_tracks</i>	int

ARGUMENTS

-mode new | unshield | reshield

Controls which action to perform during automatic shielding.

The definition for each mode is

* **new** (default)

Creates new shielding for unshielded nets. If a net is previously shielded, even partially, no new shielding is created for that net.

* **unshield**

Removes existing shielding wires that are associated with shielded nets. All tie-off connections from deleted shielding to the power and ground network are also deleted to prevent dangling power or ground (PG) nets. The remaining shielding is reconnected to the power and ground network, if needed.

This command can remove only those shielding wires that were created by using the **create_zrt_shield** command. Shielding wires created by other means, such as a third-party tool, might not have full association information and must be removed by using the **remove_route_by_type -shield** command.

If the tool can't find any shielding wires associated with shielded nets, no action is performed.

In unshield mode, only the **-nets** option is considered; all other options are ignored.

* **reshield**
Creates new shielding after unshielding the nets. The shielding is first removed by using the process described for the **unshield** mode. After moving any existing shielding, new shielding is added for the specified nets that do not have shielding.

If the design does not contain existing shielding, it is more efficient to use new mode, rather than reshift mode, because in reshift mode the tool first checks for existing shielding and then creates new shielding.

-nets *collection_of_nets*
Specifies the nets to be shielded, unshielded, or reshielded, depending on the specified mode.
When creating shielding, if the specified nets do not have shielding rules defined, the tool uses the default width and minimum spacing for the layer as defined in the technology file.
By default, this command works on all nets with defined shielding rules. To define the shielding rules, use the **define_routing_rule** and **set_net_routing_rule** commands.

-with_ground *net_name*
Specifies which power or ground net to tie the shielding wires to.
By default, the shielding wires are tied to the ground net. If the design contains multiple ground nets, you must use this option to specify the ground net.

-ignore_shielding_net_pins true | false
Controls whether the shielding wires are connected to the standard cell power or ground (PG) pins.
By default (false), this command connects the shielding wires to the standard cell PG pins.

-ignore_shielding_net_rails true | false
Controls whether the shielding wires are connected to the standard cell rails.
By default (false), this command connects the shielding wires to the standard cell rails.

-coaxial_below true | false
Controls whether coaxial shielding is created below the shielded net segment layer.
By default (false), this command does not perform coaxial shielding below the shielded net segment layer.

-coaxial_above true | false
Controls whether coaxial shielding is created above the shielded net segment layer.
By default (false), this command does not perform coaxial shielding above the shielded net segment layer.

-coaxial_below_skip_tracks *number_of_tracks*
Controls the number of tracks to be left open between coaxial shielding segments created below the shielded net segment layer.

You can specify an integer value between 0 and 7. The default is 1, which spaces the coaxial shielding segments such that they leave at least one signal routing resource on the layer. To disallow signal routing below the shielded net segment layer, specify 0.

This option is used only when **-coaxial_below** is true.

-coaxial_above_skip_tracks number_of_tracks

Controls the number of tracks to be left open between coaxial shielding segments created above the shielded net segment layer.

You can specify an integer value between 0 and 7. The default is 1, which spaces the coaxial shielding segments such that they leave at least one signal routing resource on the layer. To disallow signal routing above the shielded net segment layer, specify 0.

This option is used only when **-coaxial_above** is true.

-pg_via_tie_effort_level low | medium | high

Specifies the effort level used to tie the shielding wires to the power and ground network with vias. This option affects the via connections from the shielding wires to PG pins and wires (straps, rails, and rings) that cross shielding wires on adjacent layers.

Valid values for this option are:

- * **low**

Creates a single via or via array connection regardless of the number of intersections between the shielding structure and a PG net on an adjacent layer. Use low effort to speed up the command.

- * **medium (default)**

Creates a via or via array for each intersection between an unconnected wire in the shielding structure and a PG net on an adjacent layer; however, it avoids creating vias or via arrays in the immediate vicinity of already connected shielding wires.

- * **high**

Creates a via or via array connection for each intersection between a shielding wire and a PG net on an adjacent layer. There is a runtime cost associated with using high effort.

DESCRIPTION

The **create_zrt_shield** command shields nets based on the associated shielding rules.

By default, the command performs same-layer shielding on all nets with predefined shielding rules. The router routes shielding wires based on the shielding widths and spacing defined in the shielding rules. The shielding wires are tied to the ground net, standard cell ground pins, and standard cell rails.

To explicitly specify the nets on which to perform shielding, use the **-nets** option. To tie the shielding wires to a named power or ground net, use the **-with_ground** option. To prevent connections to the standard cell PG pins, use the **-ignore_shielding_net_pins** option. To prevent connections to the standard cell rails, use the **-ignore_shielding_net_rails** option.

By default, the command does not perform coaxial shielding. To perform coaxial shielding above the shielded net segment layer, use the **-coaxial_above true** option. To perform coaxial shielding below the shielded net segment layer, use the **-coaxial_below true** option. When the tool performs coaxial shielding, the coaxial shielding segments

- * Are routed in the preferred layer direction
- * Use the `defaultWidth` layer attribute from the technology file.
- * Are spaced as specified by the **-coaxial_above_skip_tracks** option for coaxial shielding above the shielded net segment layer and as specified by the **-coaxial_below_skip_tracks** option for coaxial shielding below the shielded net segment layer

To remove existing shielding on specified nets, use the **-mode unshield** option. To remove existing shielding on the whole design, you should use the **remove_route_by_type -shield** command.

PREREQUISITES

Before you run this command, you must first define the shielding rules with the **define_routing_rule** command and assign these rules to the nets to be shielded with the **set_net_routing_rule** command.

This requirement applies when you do not specify the **-nets** option, you want to use a nondefault width or minimum spacing, you want to snap the shielding segments to the grid, or you want to reserve space for future postroute shielding during signal routing.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines the shielding rules; assigns these shielding rules to all clock nets; and then shields the CLK_B1 and CLK_B5 clock nets with the VSS ground net, the CLK_B2 clock net with the GND ground net, and the CLK_B3 and CLK_B4 clock nets with the VDD power net. The shielding wires are not connected to the standard cell PG pins. The CLK_B5 net also has coaxial shielding above and below the shielded net segment layers and no signal routing resources are left between the coaxial shielding segments.

```
prompt> define_routing_rule clock_net_shielding \
-default_reference_rule -taper_level 0 -snap_to_track \
-widths {METAL1 0.16 METAL2 0.2 METAL3 0.2 METAL4 0.2} \

current_design

Sets the working design.

SYNTAX

```
string current_design
[design]
```

Data Types

design string

ARGUMENTS

design

Specifies the working or focal design for many dc_shell commands. If *design* is not specified or a period "." is specified, dc_shell returns to the current working design. If *design* refers to a design that cannot be found, an error is issued and the working design remains unchanged.

DESCRIPTION

The **current_design** command sets the working design for many dc_shell commands. Without arguments, **current_design** returns the name of the current working design.

To display designs currently available in dc_shell, use the **list_designs** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **current_design** to show the current context and to change the context from one design to another:

```
prompt> current_design .
Current design is 'TOP'.

prompt> list_designs
ADDER          FULL_SUBTRACTOR HALF_SUBTRACTOR TOP (*)
FULL_ADDER    HALF_ADDER      SUBTRACTOR

prompt> current_design ADDER
Current design is 'ADDER'.

prompt> current_design
Current design is 'ADDER'.
```

The **current_design** command is a parameter of other dc_shell commands. In the following example, **remove_design** is used to delete the working design from dc_shell.

```
prompt> current_design
Current design is 'TOP'.

prompt> remove_design current_design()
Removing design 'TOP'

prompt> current_design
Error: Current design is not defined. (UID-4)
```

SEE ALSO

[current_instance\(2\)](#)
[list_designs\(2\)](#)
[list_instances\(2\)](#)

current_design_name

Returns the current design name.

SYNTAX

string **current_design_name**

DESCRIPTION

This command returns the string of the current design name.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **current_design_name** to save the current design name to a variable.

```
prompt> current_design
Current design is 'TOP'.
{TOP}

prompt> set design_name [current_design_name]
Information: Defining new variable 'design_name'. (CMD-041)
TOP
Current design is 'TOP'.
```

SEE ALSO

[current_design\(2\)](#)

current_instance

Sets the working instance object and enables other commands to be used on a specific cell in the design hierarchy.

SYNTAX

```
string current_instance
[instance]
```

Data Types

instance string

ARGUMENTS

instance

Specifies the working cell in dc_shell. If *instance* is not specified, the focus returns to the top level of the current design. If *instance* is ".", dc_shell returns to the working instance. If *instance* is "..", the context is moved up one level in the instance hierarchy. If *instance* begins with "/", dc_shell returns to the working instance of the design whose name is after the "/". More complex examples of *instance* arguments are described below in EXAMPLES.

DESCRIPTION

Sets the working instance in dc_shell. An instance is a cell embedded in the hierarchy of a design; normally, you define an instance to set or get attributes on a cell.

To display the instances available at the current level of design hierarchy, use **list_instances**.

The **current_design** command changes the working design, setting the current instance to the top level of the new current design.

The **current_instance** command traverses the design hierarchy similar to the way the UNIX **cd** command traverses the file hierarchy. The **current_instance** command operates with a variety of *instance* arguments.

- If no *instance* argument is specified, the focus of dc_shell is returned to the top level of the hierarchy.
- If *instance* is ".", the current instance is returned and no change is made.
- If *instance* is "..", the current instance is moved up one level in the design hierarchy.

- If *instance* is a valid cell at the current level of hierarchy, the current instance is moved down to that level of the design hierarchy.
- Multiple levels of hierarchy can be traversed in a single call to **current_instance** by separating multiple cell names with slashes.

For example, **current_instance U1/U2** sets the current instance down two levels of hierarchy if both cells exist at the current levels in the design hierarchy.

- The "..." directive can also be nested in complex *instance* arguments.

For example, the command **current_instance ".../.../MY_INST"** attempts to move the context up two levels of hierarchy, then down one level to the "MY_INST" cell.

NOTE: The **current_instance** command does not work on leaf cells. If you attempt to run **current_instance** on a leaf cell, an error will occur.

By default, the dc_shell prompt is "prompt>". The prompt can be set to show the working instance. If you embed the string "\$CI" in the value of the variable **shell_prompt**, the working instance is shown as part of the dc_shell prompt. The command to set **shell_prompt** in this case is:

```
shell_prompt = "dc_shell$CI> "
```

For the **shell_prompt** assignment to take effect from the beginning of a dc_shell session, define this variable in your ".synopsys_dc.setup" file.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **current_instance** command to move up and down the design hierarchy and the **list_instances** command to show the available instances at each point in the hierarchy.

```

prompt> current_design .
Current design is 'TOP'.

prompt> list_instances
U1 (ADDER)      U2 (SUBTRACTOR)

prompt> current_instance U1
Current instance is 'TOP/U1'.

prompt> current_instance ..
Current instance is 'TOP/U1'.

```

```
prompt> list_instances
U1 (FULL_ADDER) U2 (FULL_ADDER) U3 (FULL_ADDER) U4 (FULL_ADDER)
```

```
prompt> current_instance U3
Current instance is 'TOP/U1/U3'.
```

```
prompt> current_instance ".../U4"
Current instance is 'TOP/U1/U4'.
```

```
prompt> current_instance
Current instance is the top-level of design 'TOP'.
```

In the following example, changing the current design resets the **current_instance** to the top level of the new design hierarchy.

```
prompt> current_design
Current design is 'TOP'.
```

```
prompt> current_instance "U2/U1"
Current instance is 'TOP/U2/U1'.
```

```
prompt> current_design ADDER
Current design is 'ADDER'.
```

```
prompt> current_instance .
Current instance is the top-level of design 'ADDER'.
```

The next example shows how to modify the variable `shell_prompt` to show the current context in the `dc_shell` prompt. Set the `shell_prompt` in your `".synopsys_dc.setup"` file.

```
prompt> list shell_prompt
shell_prompt = "prompt> "
```

```
prompt> current_instance .
Current instance is 'EXAMPLE/U77/BLAT'.
```

```
prompt> shell_prompt = "icc_shell$CI> "
"icc_shell$CI> "
```

```
icc_shell EXAMPLE/U77/BLAT> current_design TOP
Current design is 'TOP'.
```

```
icc_shell TOP>
```

The following example uses **current_instance** to go to an instance of another design. The current design is set by the new design whose name is the name after the first slash of the given instance name.

```
prompt> current_design .
Current design is 'TOP'.
```

```
prompt> current_instance U1
Current instance is 'TOP/U1'.

prompt> current_instance "/TOP/U2"
Current instance is 'TOP/U2'.

prompt> current_instance "/ALARM_BLOCK/U6"
Current instance is 'ALARM_BLOCK/U6'.
```

current_mw_cel

Gets (or sets) the working Milkyway design in the tool.

SYNTAX

```
collection current_mw_cel
[mw_cel]
```

Data Types

mw_cel cel

ARGUMENTS

mw_cel

Specifies a Milkyway design to be set as the current Milkyway design. You can specify a Milkyway design by name, name pattern, or the Milkyway design collection's name. For example, *top* matches a Milkyway design named *top* in the current library and *top** matches all Milkyway designs that have names beginning with *top*. This option must specify only one Milkyway design. Multiple Milkyway designs cannot be set as the current Milkyway design. By default, the command uses the current working Milkyway design.

DESCRIPTION

This command gets (or sets) the working Milkyway design for many other commands. If you do not specify an *mw_cel* value and the *current_mw_cel* was previously set, the command returns the value of the current Milkyway design.

If you specify an *mw_cel* value, the command first determines if the specified Milkyway design is an open Milkyway design. If the Milkyway design is not open, it instructs you to open the Milkyway design first. If it is an open Milkyway design, the command sets the current Milkyway design from the specified Milkyway design.

The following three commands change the value of the current Milkyway design:

- The **open_mw_cel** command automatically sets the opened Milkyway design as the current Milkyway design.
- The **close_mw_cel** command clears the current Milkyway design if the closed Milkyway design is the current Milkyway design.
- The **close_mw_lib** command clears the current Milkyway design if the current Milkyway design belongs to that closed library.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the **current_mw_cel** command to show the current context and changes the context from one Milkyway design to another:

```
prompt> current_mw_cel
{ "top" }

prompt> current_mw_cel [get_mw_cel ADDER]
{ "ADDER" }

prompt> current_mw_cel
{ "ADDER" }
```

The following example uses the **close_mw_cel** command to close the working Milkyway design from the tool:

```
prompt> current_mw_cel
{ "TOP" }

prompt> close_mw_cel
1

prompt> current_mw_cel
Error: No mw cel is open
```

SEE ALSO

mw_cel_collection(2)
open_mw_cel(2)
remove_mw_cel(2)
rename_mw_cel(2)
save_mw_cel(2)
```

current_mw_lib

Gets the current Milkyway library.

SYNTAX

```
collection current_mw_lib
```

ARGUMENTS

None.

DESCRIPTION

This command gets the current Milkyway library. The **current_mw_lib** command returns a collection of the current Milkyway library, if one exists.

Many Milkyway library related commands use the current Milkyway library by default. The current Milkyway library is automatically set when the **open_mw_lib** command opens a Milkyway library to use.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns the current Milkyway library in the current session:

```
prompt> current_mw_lib
{"design"}
```

```

current_scenario

Sets the current scenario.

SYNTAX

```
string current_scenario
[scenario_name]
```

ARGUMENTS

scenario_name

Specifies the name of the current scenario. If *scenario_name* is not specified, the tool returns to the current scenario.

DESCRIPTION

Sets the current scenario for many commands. Without arguments, **current_scenario** returns the name of the current scenario.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example uses **current_scenario** to set the current scenario.

```
prompt> create_scenario MODE1
Warning: Discarding all scenario specific information previously defined in t
his session. (UID-1008)
Current scenario is: MODE1
1
prompt> create_scenario MODE2
Current scenario is: MODE2
1
prompt> create_scenario MODE3
Current scenario is: MODE3
1
prompt> current_scenario MODE2
Current scenario is: MODE2
MODE2
```

SEE ALSO

```
all_scenarios(2)

```

cut_objects

Cuts from or adds to the boundary of one or more geometric objects.

SYNTAX

```
new_objects cut_objects
{-bbox rect | -boundary boundary
 | -by collection}
[-channel extra_channel_spacing]
[-invert]
[-keep_placement]
[-keep_pad_to_core_distance]
objects
```

Data Types

<i>rect</i>	x1 y1 x2 y2
<i>collection</i>	<i>new_objects</i>
<i>extra_channel_spacing</i>	real
<i>objects</i>	<i>collection</i>

ARGUMENTS

-bbox rect
Specifies the bounding box by which to cut the objects boundary or to append to the boundary.

-boundary boundary
Specifies the list of points by which to cut the objects boundary or to append to the boundary.
The boundary must be rectilinear and must have at least four points.

-by collection}
Specifies the list of objects by which to cut the specified objects boundary or to append to the specified objects boundary.
These objects must be geometric (that is, have at least a bounding box) and can be rectilinear.
See the man page for the **get_edit_property** command for details on which objects support these properties.

-channel extra_channel_spacing
Specifies extra channel spacing by which to cut.
By default, this option is off.

-invert
Specifies to invert the cut so that instead of cutting from the objects boundary, the overlapping shape is added to the boundary.
By default, this option is off.

-keep_placement
This option is effective only when applied to the core or the die. It will be ignored if applied on any other object.

Cells in the core and IO pad cells are re-placed if necessary. The relative positions of the cells are not guaranteed to be preserved, although an attempt will be made to preserve them as much as possible. Furthermore, the output of the re-placement is not legalized. The user needs to explicitly legalize the placement using `legalize_placement`. The default is **false**.

`-keep_pad_to_core_distance`

This option is effective only when applied to the core or the die. It will be ignored if applied on any other object.

This maintains the distance between the core and the pad cells and by implication the distance between the core and the die, thus forcing changes to the core and the die to be made in tandem with each other. If pad cells are absent then the core-to-die distance will still be maintained.

The default is **false**.

`objects`

Specifies the list of objects which will be processed.

These objects must either be resizable or support a rectilinear boundary depending on the final result of the cut.

See the man page for the **get_edit_property** command for details on which objects support these properties.

By default, this option is off.

RETURNS

`new_objects`

Contains a list of the new split objects.

DESCRIPTION

This command cuts from or adds to the boundary of a set of objects by using an explicit bounding box, an explicit list of points, or the boundary of one or more specified objects.

When multiple objects are specified to be cut each object is treated independently.

When multiple objects are specified by which to cut, the result is the cumulative result of all cuts.

Note: Cutting takes place only if the bounding box, list of points, or object boundary by which to cut, overlaps with the boundary of the object being cut.

Snapping is done automatically using global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example cuts the boundary of the selected objects by a bounding box

`cut_objects`

```
defined by the points {0 0} {100 100}.
```

```
prompt> cut_objects -bbox {0 0 100 100} [get_selection]
```

The following example cuts the boundary of the selected objects by a list of points which represent the bounding box {0 0} {100 100}.

```
prompt> cut_objects -boundary {{0 0} {100 0} {100 100} {0 100}} \  
[get_selection]
```

The following example cuts the boundary of all the non-fixed selected objects by the fixed selected objects:

```
prompt> set unfixed [filter [get_selection] "is_fixed==false"]  
prompt> set fixed [filter [get_selection] "is_fixed==true"]  
prompt> cut_objects -by $fixed $unfixed
```

SEE ALSO

```
set_object_boundary(2)  
set_object_shape(2)
```

cut_row

Cuts rows from the current design.

SYNTAX

```
status cut_row
[-all]
[-area {{ll_x ll_y} {ur_x ur_y}}]
```

ARGUMENTS

-all
Specifies to cut all rows from the current design.
The option and -area {{ll_x ll_y} {ur_x ur_y}} are mutually exclusive.

-area {{ll_x ll_y} {ur_x ur_y}}
Specifies to cut rows in the specified area.
The option and -all are mutually exclusive.

DESCRIPTION

This command cuts rows from the *current design*. If the **-all** option is specified, all rows are cut in the design. If an area is given, the rows in the specified area are cut. The command returns a value of **1** if it succeeds, or **0** if the command fails.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example cuts rows in the specified rectangle:

```
prompt> cut_row -area {250 1710 1800 1730}
1
```

SEE ALSO

`add_row(2)`

date

Returns a string containing the current date and time.

SYNTAX

string **date**

DESCRIPTION

The **date** command generates a string containing the current date and time, and returns that string as the result of the command. The format is fixed as follows:

ddd mmm nn hh:mm:ss yyyy

Where:

ddd is an abbreviation for the day
mmm is an abbreviation for the month
nn is the day number
hh is the hour number (24 hour system)
mm is the minute number
ss is the second number
yyyy is the year

The **date** command is useful because it is native. It does not fork a process. On some operating systems, when the process becomes large, no further processes can be forked from it. With it, there is no need to call the operating system with **exec** to ask for the date and time.

EXAMPLES

The following command prints the date.

```
prompt> echo "Date and time: [date]"  
Date and time: Thu Dec 9 17:29:51 1999
```

SEE ALSO

define_antenna_accumulation_mode

Defines an antenna accumulation mode route rule.

SYNTAX

```
status define_antenna_accumulation_mode
[mw_lib]
[-cut_to_metal]
[-metal_to_cut]
```

Data Types

mw_lib list

ARGUMENTS

mw_lib

Specifies the Milkyway library to be updated. The value of *mw_lib* can be a library name or a one-element collection of a library. The *mw_lib* option is optional. The default is to use the current Milkyway library.

-cut_to_metal

When *-cut_to_metal* is on, via ratios will be accumulated to metal ratios.
Default is off.

-metal_to_cut

When *-cut_to_metal* is on, metal ratios will be accumulated to cut ratios.
Default is off.

DESCRIPTION

This command defines an antenna accumulation mode route rule and stores it in the library. The command returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> define_antenna_accumulation_mode
      -cut_to_metal -metal_to_cut
1
```

SEE ALSO

```

```

define_antenna_layer_ratio_scale

Creates an antenna layer ratio route rule.

SYNTAX

```
status define_antenna_layer_ratio_scale
[mw_lib]
-layer layer_name
-layer_scale layer_scale
-accumulate_scale accumulate_scale
```

Data Types

<i>mw_lib</i>	list
<i>layer_name</i>	string
<i>layer_scale</i>	float
<i>accumulate_scale</i>	float

ARGUMENTS

mw_lib

Specifies the Milkyway library to be updated. The value of *mw_lib* can be a library name or a one-element collection of a library. The *mw_lib* option is optional. The default is to use the current Milkyway library.

-layer *layer_name*

Name of the layer.

-layer_scale *layer_scale*

Layer scale factor.

-accumulate_scale *accumulate_scale*

Accumulation scale factor.

DESCRIPTION

This command creates an antenna layer ratio route rule. The command returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> define_antenna_layer_ratio_scale -layer metall1
-layer_scale 1000.00 -accumulate_scale 2.00
```

SEE ALSO

```
define_antenna_rule(2)
define_antenna_layer_rule(2)
report_antenna_rules(2)
remove_antenna_rules(2)
```

define_antenna_layer_rule

Defines an advanced antenna rule for the specified layer and stores it in the library.

SYNTAX

```
status define_antenna_layer_rule
[mw_lib]
-mode mode
-layer layer_name
-ratio ratio
[-pratio pratio]
[-nratio nratio]
-diode_ratio diode_ratio
[-scale_factor scale_factor]
```

Data Types

<i>mw_lib</i>	list
<i>mode</i>	int
<i>layer_name</i>	string
<i>ratio</i>	float
<i>pratio</i>	float
<i>nratio</i>	float
<i>diode_ratio</i>	list
<i>scale_factor</i>	list

ARGUMENTS

mw_lib

Specifies the Milkyway library to be updated. The value of *mw_lib* can be a library name or a one-element collection of a library. By default, the command uses the current Milkyway library.

-mode *mode*

Defines the way antenna areas are computed. The valid values and their descriptions are as follows:

- 1 -Uses polygon area, ignoring all lower-layer segments.
- 2 -Uses polygon area, including all lower-layer segments to the input pins.
- 3 -Uses polygon area, including all lower-layer segments.
- 4 -Uses side-wall area, ignoring all lower-layer segments.
- 5 -Uses side-wall area, including all lower-layer segments to the input pins.
- 6 -Uses side-wall area, including all lower-layer segments.

Note that only one rule can be defined for each mode. If two commands contain the same mode number, the second command overwrites the first one.

-layer *layer_name*

Specifies the name of the valid metal layer or cut layer in the library.

-ratio *ratio*

Specifies the maximum allowable ratio of the antenna area to the gate area if the antenna is not protected by any diode. Any number is a valid value for

ratio.

-pratio *pratio*
 Specifies the maximum allowable ratio of the antenna area to the p-gate area.

-nratio *nratio*
 Specifies the maximum allowable ratio of the antenna area to the n-gate area.

-diode_ratio *diode_ratio*
 Specifies the allowable ratio of the antenna area to the gate area if the antenna is protected by a diode. The valid values for *diode_ratio* are **{v0 v1 v2 v3 [v4]}**. If the output pin protection value specified in the Cell Library Format (CLF) file is **dp**, the allowable ratio for *diode_ratio* is the following:
 $((dp + v1) * v2 + v3), \text{ if } (dp) > (v0)$
 $\text{layer_max_ratio}, \text{ if } (dp) \leq (v0)$
 The default value is **{0 1 0 0}**.

-scale_factor *scale_factor*
 Specifies the scale factor of the metal area to the gate area. This option is only valid for diode mode 11 and diode mode 12.

DESCRIPTION

This command defines an advanced antenna rule for the specified layer and stores it in the library. The command returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines an advanced antenna rule using a mode with a side-wall area, ignoring all lower-layer segments, for a metal layer named *metall1* with a diode ratio as shown.

```
prompt> define_antenna_layer_rule 4 metall1 400 {0.336 -0.5 400 2400
```

SEE ALSO

```
define_antenna_rule(2)
report_antenna_rules(2)
remove_antenna_rules(2)
```

define_antenna_rule

Defines an advanced antenna rule for the specified mode and stores it in the library.

SYNTAX

```
status define_antenna_rule
[mw_lib]
-mode mode
-diode_mode diode_mode
-metal_ratio metal_ratio
-cut_ratio cut_ratio
[-protected_metal_scale metal_scale]
[-protected_cut_scale cut_scale]
```

Data Types

<i>mw_lib</i>	list
<i>mode</i>	integer
<i>diode_mode</i>	integer
<i>metal_ratio</i>	float
<i>cut_ratio</i>	float
<i>metal_scale</i>	float
<i>cut_scale</i>	float

ARGUMENTS

mw_lib

Specifies the Milkyway library to be updated. The value of *mw_lib* can be a library name or a one-element collection of a library. The default is to use the current Milkyway library.

-mode mode

Defines the way antenna areas are computed. The valid values and their descriptions are as follows:

- 1** -Uses a polygon area, ignoring all lower-layer segments.
- 2** -Uses a polygon area, including all lower-layer segments to the input pins.
- 3** -Uses a polygon area, including all lower-layer segments.
- 4** -Uses a side-wall area, ignoring all lower-layer segments.
- 5** -Uses a side-wall area, including all lower-layer segments to the input pins.
- 6** -Uses a side-wall area, including all lower-layer segments.

Note that only one rule can be defined for every mode. If two commands contain the same mode number, the second command overwrites the first one.

-diode_mode diode_mode

Defines the protection capability of the diode. By default, all output pins are considered to be a diode. The valid values and their descriptions are as follows:

- 0** -Output pin cannot protect antenna.
- 1** -Any diode can provide unlimited protection.
- 2** -Diode protection is limited; if more than one diode is connected, the

largest value of max-antenna-ratio for all diodes is used.

3 -Diode protection is limited; if more than one diode is connected, the sum of max-antenna-ratio for all diodes is used.

4 -Diode protection is limited; if more than one diode is connected, the sum of all diode-protection values for all diodes is used to compute the max-antenna-ratio.

5 -Diode protection is limited; the maximum diode-protection value for all diodes is used to calculate the equivalent gate area.

6 -Diode protection is limited; the sum of all diode-protection values for all diodes is used to calculate the equivalent gate area.

7 -Diode protection is limited; the maximum diode-protection value for all diodes is used to calculate the equivalent metal area.

8 -Diode protection is limited; the sum of all diode-protection values for all diodes are used to calculate the equivalent metal area.

9 through 12 -Reserved for various particular antenna modes.

`-metal_ratio metal_ratio`

Specifies the maximum allowable ratio for metal area to gate size if the metal layer is not defined by using the **define_antenna_layer_rule** command. If this value is zero, the ratio is ignored. The valid value is any non-negative number.

`-cut_ratio cut_ratio`

Specifies the maximum allowable ratio for cut area to gate size if the cut layer is not defined by using the **define_antenna_layer_rule** command. If this value is zero, the ratio is ignored. The valid value is any non-negative number.

`-protected_metal_scale metal_scale`

Specifies the value used to scale the area of the metal layer that is protected by the diode. The option is used only when the mode is 2 or 5. If this value is zero, the scale is ignored. The valid value is any non-negative number. By default, the value is set to 1.0.

`-protected_cut_scale cut_scale`

Specifies the value used to scale the area of the cut layer that is protected by a diode. The option is used when mode is 2 or 5 only. If this value is zero, the scale is ignored. The valid value is any non-negative number. By default, the value is set to 1.0.

DESCRIPTION

This command defines an advanced antenna rule for the specified mode and stores it in the library.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the use of the command specifying a polygon area

(ignoring all lower-layer segments), limited diode protection, maximum allowable ratio for metal area to gate size of 1000, and a maximum allowable ratio for cut area to gate size of 0.

```
prompt> define_antenna_rule -mode 1 -diode_mode 2\
-metal_ratio 1000 -cut_ratio 0
```

SEE ALSO

```
define_antenna_layer_ratio_scale(2)

ARGUMENTS

`name_rules`

Specifies the name of the rules being defined. If named rules called `name_rules` do not exist, they are created.

`-max_length length`

Specifies the maximum length of a name, which must be 8 or more characters, except that a value of 0 resets the maximum length to its default (any length).

`-target_bus_naming_style bus_naming_style`

Specifies the target bus naming style for all object types, to which the current bus naming style is to be changed. For this option to succeed, set the **bus_naming_style** variable with the current bus naming style. For an example, see the section entitled "Changing the Bus Naming Style". By default, the target bus naming style is set to be the same as the current bus naming style. If the target bus naming style is different from the current bus naming style, after the rule is applied through the **change_names** command, the bus naming style becomes the target bus naming style, but this does not occur automatically. If more **change_names** commands need to be issued later, be careful that the bus naming style is in transition from one rule to another rule and needs to be set manually to reflect the real bus style inside the .db file during the transition.

`-allowed allowed_chars`

Specifies the set of characters allowed in names, which must be 10 or more characters. The format of the `allowed_chars` string is provided in the "DESCRIPTION" section. By default, any printable character is allowed in a name.

`-restricted restricted_chars`

Specifies the set of characters not allowed in names. The format of the `chars` string is provided in the "DESCRIPTION" section. By default, any printable character is allowed in a name.

`-first_restricted first_chars`

Specifies a set of characters that are not allowed as the first character in a name. The format of the `chars` string is provided in the "DESCRIPTION" section. By default, any printable character is allowed as the first character of a name.

`-last_restricted last_chars`

Specifies a set of characters not allowed as the last character in a name. The format of the `chars` string is described in the "DESCRIPTION" section. By default, any printable character is allowed as the last character of a name.

`-reserved_words reserves`

Specifies a list of words that cannot be used as a name. The `reserves` value contains words that are considered reserved in your target system. By default, there are no reserved words.

-replacement_char char
 Specifies the character used to replace characters not allowed in names, as specified by the **-allowed** or **-restricted** option. By default, the replacement character is the underscore character (_).

-remove_chars
 Specifies that characters not allowed in names, as specified by the **-allowed** or **-restricted** option, are removed rather than replaced. By default, illegal characters are replaced by the character specified with **-replacement_char**.

-equal_ports_nets
 Specifies that nets connected to non-inout ports must have the same name as their connecting port. If a net is connected to more than one port, the net's name is not changed and a warning is issued. By default, nets are not required to match the names of the non-inout ports to which they are connected.

-inout_ports_equal_nets
 Specifies that nets connected to inout ports must have the same name as their connecting port. If a net is connected to more than one port, the net's name is not changed and a warning is issued. By default, nets are not required to match the names of the inout ports to which they are connected.

-collapse_name_space
 Specifies that the name space of ports, cells, and nets is the same. No port, cell, or net in a design can have the same name. By default, ports, cells, and nets each have their own name space.

-case_insensitive
 Specifies that the case of characters is not significant when comparing names. For example, the name *example* (lowercase) is equivalent to *EXAMPLE* (uppercase). If two names are equivalent within a name space, one of the names must be changed. By default, the case of a name is significant.

-special output_format
 Specifies to use special rules pertaining to a specific target system when changing names. By default, no special rules apply. The possible values for *output_format* are as follows:

```
verilog
vhdl
sge
vhdl93
sge_vhdl
siff
```

-prefix prefix_name
 Specifies a prefix used when changing a name. By default, the prefixes are **P** for ports, **U** for cells, and **N** for nets.
 Use this option only when the **change_names** command needs to create a completely new name to ensure the name's uniqueness. See Step 3 of the "Naming Rules" section for more information.

-map map_string
 Provides a way to change objects in addition to the the previously specified name rules. This option specifies the name mapping and replacement rules as

defined in the *map_string*. See "Mapping Rules" under the "Naming Rules" section for details.

-type object_type
 Specifies that the rules being defined apply only to the given type of objects. Allowed values for *object_type* are **port**, **cell**, or **net**. By default, the defined rules apply to all object types.

-reset
 Resets all rules to their default values. When all rules are set to the defaults, no restrictions are imposed on the names.

-remove_internal_net_bus
 Bit-blasts all internal net buses.

-remove_port_bus
 Bit-blasts all port buses. Net buses that connect to ports are also bit-blasted.

-check_bus_indexing
 Checks the indices of buses and bit-blasts the incomplete buses.

-check_bus_indexing_use_type_info
 Checks bus indexing based on the bus type information and bit-blast for incomplete port buses.

-rename_three_state_port_net
 Renames three-state port nets so they have different names from the ports on the inout port connections.

-check_internal_net_name
 Checks and renames nets that have the same name as some ports, but the nets are not connected to these ports.

-remove_irregular_port_bus
 Bit-blasts any port bus that contains irregular members.

-remove_irregular_net_bus
 Bit-blasts any net bus that contains irregular members.

-flatten_multi_dimension_busses
 Flattens multi-dimension ports, net buses, and arrays so writing out is easier.

-dont_change_bus_members
 Specifies not to change the elements that are in either a port bus or a net bus. This option overrides the previous four options (**-remove_irregular_port_bus**, **-remove_irregular_net_bus**, **-flatten_multi_dimension_busses**, and **-dont_change_bus_members**). If this option is set, these four options are reset to the default value of **false**. In most cases, this option should remain **false**.

-dont_change_ports
 Specifies not to change elements that are set by the **-type** option to **port**.

```

-add_dummy_nets
    Adds dummy nets for unconnected pins. The -dummy_net_prefix option specifies
    the format to name dummy nets. The format defaults to
    SYNOPSYS_UNCONNECTED_%d.

-dummy_net_prefix dummy_nets_format
    Sets the prefix for the dummy net naming convention. The dummy_nets_format
    value specifies the format to name the dummy nets.

-dir inout_as_in
    Instructs the tool to treat all instances with the INOUT direction as if they
    were set to IN. The default behavior is to treat them as direction OUT.

```

DESCRIPTION

The **define_name_rules** command defines a set of rules for naming design objects. Name rules are used by the **change_names** and **report_names** commands. The **report_name_rules** command displays a listing of the name rules currently defined in the shell.

Name rules can be defined in multiple calls to the **define_name_rules** command. For an example of multiple calls, see the "EXAMPLES" section.

The **-type** option enables you to define rules that apply to a specific object type, such as port, cell, or net). Each call to **define_name_rules** is additive or overrides previous calls for a specific name rules.

Naming Rules

This section describes the effects of specific options when defining name rules with **define_name_rules**.

Maximum Length Rules

The maximum number of characters in a name can be restricted with the **-max_length** option.

Names shorter than the specified maximum length remain unchanged. Names longer than the specified maximum length are modified so that their lengths are less than or equal to the maximum.

Fixed names are guaranteed to be unique within the design. The following steps are applied in succession to fix a name to meet the uniqueness criteria:

- Step 1

Truncation - Names are truncated to meet the maximum length. The truncated name is accepted if it is unique within the design. For example, if the name is THIS_NAME_IS_TOO_LONG_TO_BE_ACCEPTABLE and the maximum number of characters is 16, the resulting name is THIS_NAME_IS_TOO.

- Step 2

Truncation with index - Names are truncated. The truncated name is appended with an index in an attempt to make it unique. If a unique name is found, it is accepted. If the name from the previous example, THIS_NAME_IS_TOO, is not unique, this the tool tries THIS_NAME_IS_T1, THIS_NAME_IS_T2, and continues up to, THIS_NAME_IS_T99. The first unique name is accepted.

- Step 3

Basic names - If both previous steps fail, the original name is deleted and names of the form <prefix><index> are generated until a unique name is found. The <prefix> is defined using the **-prefix** option. Examples are N1, N2, and so on.

If all three steps fail to generate a unique name, the original name is retained and a warning message is issued.

Character Restriction Rules

Specify characters that make up names with the **-allowed**, **-restricted**, **-first_restricted**, and **-last_restricted** options.

To specify the character set allowed, use **-allowed** or **-restricted**. Either of these options overrides the previous values of **-allowed**, **-restricted**, **-first_restricted**, and **-last_restricted**.

In conjunction with **-allowed** or **-restricted**, use **-first_restricted** and **-last_restricted** to further restrict the available characters for the first and last character of a name. The **-first_restricted** and **-last_restricted** options depend on **-allowed** and **-restricted**, and modify the set of available characters for their special cases. The set of characters available for first and last characters cannot exceed that defined for all other characters.

The `allowed_chars`, `restricted_chars`, `first_chars`, and `last_chars` strings contain characters that can be used (they are **-allowed**), or cannot be used (they are **-restricted**) in design object names. The dash (-) character indicates a range of ASCII characters. To include a literal dash character in a `chars` parameter, precede it with 2 backslashes (\-). Blank spaces are disregarded. A minimum of 10 characters must be allowed or an error is reported. The order of the characters in the `chars` string parameters is not significant.

The following example specifies a character set consisting of uppercase characters and an underscore.

```
prompt> define name rules -allowed "A-Z" "
```

In the following example, some punctuation characters are restricted. The dash (-) character is restricted with the character sequence \-. The double quotation marks ("") are restricted with the sequence First characters cannot be lowercase.

```
prompt> define_name_rules -restricted "!@#$%^&*()\\-\" \n      -first restricted "a-z"
```

The following example attempts to restrict the character set to fewer than 10 characters. An error is reported.

```
prompt> define name rules -allowed "ABCDE"
```

If a design object name contains a character that is restricted for its object type, the following steps are taken to fix the name:

- Step 1

Remove the character - If **-remove_chars** is specified in the name rules, the offending character is removed.

- Step 2

Change the case - The case of characters is changed to meet character restrictions. The change is accepted if the new character is allowed. For example, if names are restricted to uppercase characters, the name `sum_port` is changed to `SUM_PORT`.

- Step 3

Replace the character - A restricted character is changed to the value of **-replacement_char**. For example, if punctuation characters are not allowed and the replacement character is an underscore, the name U\$1 is changed to U_1.

- Step 4

Uniquify the name - If the name created in either Step 1 or Step 2 is not unique, an index is appended to the new name.

Reserved Word Rules

Prohibit specific names from becoming design object names by using the **-reserved_words**. The parameter to this option is a list of names that are not allowed as design object names.

The following example uses **-reserved_words**. The words DESIGN, MODULE, START, and END are designated as reserved. The case of the names in this list is significant.

```
prompt> define_name_rules \
      -reserved_words {"DESIGN", "MODULE", "START", "END"}
```

Case Insensitive Rules

If **-case_insensitive** is specified, the case of the characters in a name is not significant when comparing names.

If **-case_insensitive** is specified, the case of characters in reserved words is not significant. For example, if **-case_insensitive** is used and the string MODULE is specified as a reserved word, the name module is also considered a reserved word and changed.

Port and Net Rules

Make the name of a net connected to a port equal to the name of that port with **-equal_ports_nets**. If this substitution causes a conflict, no names are changed and a warning message is issued. If a net is connected to more than one port, no names are changed and a warning message is issued.

Name Space Rules

By default, name spaces of ports, cells, and nets are separate. Names of ports and cells must be unique within a design. A port, a cell, and a net within a design can share the same name.

Name spaces for ports, cells, and nets can be shared using the **-collapse_name_space** option. Ports, cells, and nets within a design must be unique across all objects. Conflicting names are modified by appending digits to their name. The **-collapse_name_space** option cannot be specified with **-equal_ports_nets**, because the two options conflict.

Type-Specific Rules

Name rules can be tailored for ports, cells, and nets object types with the **-type** option. The options to **define_name_rules** that can be specified by object type are as follows:

```
-max_length
-allowed
-restricted
-first_restricted
-last_restricted
-replacement_char
```

```
-remove_chars
-prefix
```

To specify the maximum length restriction on ports different than the maximum length for cells, make multiple calls to **define_name_rules**.

In the following example, the maximum length of ports is set to 12. The maximum length of cells is set to 8. The maximum length of nets is unrestricted.

```
prompt> define_name_rules EXAMPLE -max_length 12 -type port
prompt> define_name_rules EXAMPLE -max_length 8 -type cell
```

Special Rules

Define name rules that are for a specific target system and cannot be modeled with the general **define_name_rules** options. The systems supported by the **-special** option are *sge*, *vhdl*, *vhdl93*, *sge_vhdl*, and *siff*.

Specifying **-special vhdl** adds one rule to make names conform to the rules of VHDL. This option does not allow consecutive underscores in a name.

Specifying **-special vhdl93** adds one rule to make names conform to the rule of VHDL93. This option adds support for an extended identifier. An extended identifier is a sequence of characters that are defined by the VHDL93 character set and are written between two backslashes (\ \).

Specifying **-special sge** adds one rule to make names conform to the rules of the SGE system. This option does not allow net names that start with the characters BBBB_ and NNNN_. These names are reserved by the SGE system.

Specifying **-special sge_vhdl** is a combination of the previous two rules. The **change_names** command enforces **-collapse_name_space** and **-equal_ports_nets**, but because these two rules conflict with each other, the **sge_vhdl** rule applies under the following conditions:

- The **-collapse_name_space** rule first checks the object class type. If the object is a port, it checks to see if the name is used by any reference names. If the object is a cell or a design, it verifies that the name is not used previously by any reference or port. If the object is a net, it checks the reference, port, and cell name spaces. If there is a name conflict, it changes the name so that it is unique. Refer to the **-collapse_name_space** rule description for details.
- The **-equal_ports_nets** rule is applied to a scalar net or a net object whose owning bus is not of a single width. Refer to the **-equal_ports_nets** rule description for details.
- Specifying **-special siff** adds one rule to make names conform to the rules for the "Synopsys Integrator For Falcon Framework."

All of the special rules previously given share the same name rules in addition to their own name rules:

- The names of bused ports or nets follow the *bus_naming_style*, except that *sge_vhdl* always uses "%s(%d)" instead of *bus_naming_style*.
- The names of bused ports or nets owned by the same bus have the same base name. The bus index order follows the index part defined in the owning bus.

- If a net does not belong to a busbag and it contains a separator character defined in the **bus_naming_style** variable, this separator character changes to _ (underscore) and the ending separator is removed. For example, the net name sample[24][3] changes to the name sample_24_3.

Specifying **-special** does not create all of the rules necessary for VHDL, SGE, or SIFF compliance. Only the non-general rules previously described are created. To **define_name_rules** to constrain names to fully meet the requirements of SGE and VHDL, use the other options in conjunction with **-special**.

To avoid conflict, do not merge special name rules with name rules that you defined. When defined name rules conflict, **change_names** could generate names that are not compliant to your name rule. When there is a conflict among name rules, define each one of those name rules using a different name in **define_name_rules** and apply each of them using **change_names**. The last rule applied generates names that override names generated by previous rules.

Mapping Rules

The **-map** option specifies the name mapping and replacement rules as defined in the *map_string*. The mapping string has the following format:

```
{"pattern", "replacement"} [, {"pattern", "replacement"}]*
```

The mapping string is grouped into pairs. There can be any number of pairs in a mapping string. Each pair is enclosed by a {} (curly braces) and separated by a , (comma). The **change_names** and **report_names** commands apply all of them according to the order specified in the *map_string*.

The first member of each pair is the *pattern* string, which is used to match against the object name. The second member is the *replacement* string, which is used to replace the matched portion of the object name. Both the *pattern* and *replacement* string must begin and end " (double quotation marks). There is a , (comma) between *pattern* and *replacement* string.

The following example has the first occurrence of any portion of a object name that contains **_reg** replaced by an empty string and the first occurrence of any portion of a object name that contains **A** replaced by **a** in the new name.
prompt> define_name_rules my_rule -map {"_reg", ""}, {"A", "a"}}
The pattern string also provides limited regular expression capability. The following 4 special characters are supported to make the mapping strings more specific.

- The \$ (dollar sign) indicates the end of string.
- The ^ (caret) indicates the beginning of string.
- The * (asterisk) indicates a wildcard matching 0 or more characters.
- The ? (question mark) indicates a wildcard matching 1 character.

The following example defines a rule that any name ending with **_reg** is replaced by **in** at the end string:

```
prompt> define_name_rules my_rule0 -map {"_reg$", "in"}
```

The following example defines a rule that any name beginning with **_reg** is replaced by **in** at the beginning of the string:

```
prompt> define_name_rules my_rule1 -map {"^_reg", "in"}
```

The following example defines a rule that the first occurrence of any substring of a name that begins with **_r** and ends with **g** is replaced by the **in** string:

```
prompt> define_name_rules my_rule2 -map {"_r*g", "in"}
```

The following example defines a rule that the first occurrence of any substring of a name that begins with **_r** followed any one character, then ending with **g** is replaced by **in**:

```
prompt> define_name_rules my_rule3 -map {"_r?g", "in"}
```

Once a mapping rule is defined, you can only use **-reset** to reset the mapping rule. You cannot redefine the same matching pattern within the same rule. For example, assume you define the following rule:

```
prompt> define_name_rules my_rule4 -map {"A", "X"}
```

If you then decide to replace all occurrences of **A** with **Z**, you must first execute a reset and then redefine the name rules as follows:

```
prompt> define_name_rules my_rule4 -reset
```

```
prompt> define_name_rules my_rule4 -map {"A", "Z"}
```

To insert escape characters into names, you can also use the **-map** option. This is useful prior to generating reports, if the report output is processed by a program that requires certain characters to be escaped. For example, if names contain the / (slash) character, the tool cannot differentiate between a / used in a name and a / that denotes a change in hierarchy. Defining a rule with the following command replaces any / in a name with \\ (backslash slash).

```
prompt> define_name_rules -map {"/", "\\\\"}
```

The name **HAS\SLASH** inside hierarchy **A** writes out as **A/HAS\\SLASH**.

Use {} around the *map_string* to reserve the content of the *map_string* as shown in the example:

```
prompt> define_name_rules my_rule -map {{{"_reg", ""}, {"A", "a"}}}
```

Default Rules Values

Once defined, you can reset name rules to their default values with the **-reset** option. Name rules with all default values impose no restrictions on design object names.

Default values for specific rules are shown below. A set of name rules called **ALL_DEFAULTS** is defined with no options. The **report_name_rules** command displays the default value of each specific rule.

```
prompt> define_name_rules ALL_DEFAULTS
```

```
prompt> report_name_rules ALL_DEFAULTS
```

```
*****
Report : name_rules
Name Rules : ALL_DEFAULTS

```

Applying Name Rules

When names are changed using the **change_names** or **report_names** command, name rules are applied sequentially even though they are specified concurrently in the **define_name_rules** command. Name rules are applied in order, so rules applied later might overwrite previous names rules and there will be cases where names after **change_names** or **report_names** do not conform to all rules specified.

This section describes the order in which name rules are applied, and the results you can expect.

The name rules are applied in the following order:

1. Map rule: rules that are applied to an object name string. The rule in this category is **-map_rule**.
2. Character rules: rules that are applied to object name characters. Rules in this category are **-allowed**, **-restricted**, **-first_restricted**, and **-last_restricted**. To support the character rules, use **-remove_char** and **-replacement_chars**.
3. Design rules: rules that are applied to object names in terms of whole design naming methodology. Rules in this category are **-equal_ports_nets** (for net objects only), **-special**, **-max_length**, and **-reserve_words**.
4. Meta rules: rules that extend beyond one of the previous single categories. Rules in this category are **-collapse_name_space**, **-case_insensitive**, **-prefix**, and **-type**. Since rules applied earlier might be overwritten by later rules, apply the "must have" rule last. The name rules are applied to object names according to the order shown above. That is, the string rules are applied first, then the character rules, and the design rules are last. Meta rules are used for supporting those rules during

name changes. Rules within the same category are applied following the same order as the prior list. Because later rules might override previous ones, to preserve the priority it is better to use those rules that cause conflict separately. Among these rules, use mapping primarily.

During name changes, the objects are categorized into three types: port, cell, and net. Port objects are changed first, then cell objects, then net objects. When there is a name conflict among a port name, a cell name, and a net name, the port name has highest priority (it is not changed). The net and port names must be changed to unique names.

Changing the Bus Naming Style

When **define_name_rules** changes the bus naming style, use the **bus_naming_style** variable to identify the bus naming style used by the current database.

For example, the following script changes the bus naming style from [] to < >:

```
prompt> define_name_rules change_bus_naming_style \
           -target_bus_naming_style "%s<%d>" \
           bus_naming_style="%s[%d]" 

prompt> change_names -rule change_bus_naming_style -hierarchy
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines a name rule called *SIMPLE* that requires design names in uppercase. The *SIMPLE* name rule is used as the default name rule by **change_names**.

```
prompt> define_name_rules SIMPLE -allowed "A-Z _"

prompt> default_name_rules = SIMPLE

prompt> change_names
Information: Using name rules 'SIMPLE'.
Information: 153 names changed in design 'MY_DESIGN'.
```

The following example defines name rules called *MY_RULES* using multiple calls to **define_name_rules**. The length of names is restricted to 16 characters. The example defines the allowed character set and a replacement character:

```
prompt> define_name_rules MY_RULES -max_length 16

prompt> define_name_rules MY_RULES -replacement_char "X"
```

```
prompt> define_name_rules MY_RULES -allowed "A-Z _"
```

In the following example, multiple calls to **define_name_rules** use most of the options. The **report_name_rules** command displays the effect of these calls.

```
prompt> define_name_rules SMORG -collapse_name_space  
prompt> define_name_rules SMORG -case_insensitive  
prompt> define_name_rules SMORG -reserved_words {IN,OUT,INOUT}  
prompt> define_name_rules SMORG -case_insensitive  
prompt> define_name_rules SMORG -type port -max_length 16 \  
-allowed "A-Z a-z 0-9_*" \  
-replacement_char "*"  
prompt> define_name_rules SMORG -type cell -prefix "CELL" \  
-restrict "()[]{}"  
prompt> define_name_rules SMORG -type net -allowed "A-Za-z_*" \  
-first_restrict "0-9" -last_restrict "0-9" \  
-replacement_char **"  
prompt> report_name_rules SMORG

define_proc_attributes

Defines attributes of a Tcl procedure, including an information string for help, a command group, a set of argument descriptions for help, and so on. The command returns the empty string.

SYNTAX

```
string define_proc_attributes
proc_name
[-info info_text]
[-define_args arg_defs]
[-command_group group_name]
[-hide_body]
[-hidden]
[-dont_abbrev]
[-permanent]
```

Data Types

<i>proc_name</i>	string
<i>info_text</i>	string
<i>arg_defs</i>	list
<i>group_name</i>	string

ARGUMENTS

<i>proc_name</i>	Name of the existing procedure.
-info <i>info_text</i>	Provides a help string for the procedure. This is printed by the help command when you request help for the procedure. If you don't specify <i>info_text</i> , the default is "Procedure".
-define_args <i>arg_defs</i>	Defines each possible procedure argument for use with help -verbose . This is a list of lists where each list element defines one argument.
-command_group <i>group_name</i>	Defines the command group for the procedure. By default, procedures are placed in the "Procedures" command group.
-hide_body	Hides the body of the procedure from info body .
-hidden	Hides the procedure from help and info proc .
-dont_abbrev	The procedure can never be abbreviated. By default, procedures can be abbreviated, subject to the value of the sh_command_abbrev_mode variable.

-permanent

Defines the procedure as permanent. You cannot modify permanent procedures in any way, so use this option carefully.

DESCRIPTION

The **define_proc_attributes** command associates attributes with a Tcl procedure. These attributes are used to define help for the procedure, locate it in a particular command group, and protect it.

When a procedure is created with the **proc** command, it is placed in the Procedures command group. It has no help text for its arguments. You can view the body of the procedure with **info body**, and you can modify the procedure and its attributes. The **define_proc_attributes** command allows you to change these aspects of a procedure.

Note that the arguments to Tcl procedures are all named positional arguments. They can be programmed with default values, and there can be optional arguments by using the special argument name **args**. The **define_proc_attributes** command does not relate the information that you enter for argument definitions with **-define_args** to the actual argument names. If you are describing anything other than positional arguments, it is expected that you are also using **parse_proc_arguments** to validate and extract your arguments.

The *info_text* is displayed when you use the **help** command on the procedure.

Use **-define_args** to define help text and constraints for individual arguments. This makes the help for the procedure look like the help for an application command. The value for **-define_args** is a list of lists. Each element has this format:

arg_name option_help value_help data_type attributes

The *arg_name* is the name of the argument. *option_help* is a short description of the argument. The *value_help* is typically the argument name for positional arguments, or a one word description for dash options. It has no meaning for a boolean option. The *data_type* and *attributes* are optional and will be used for option validation. The *data_type* can be any of: string, list, boolean, int, float, or one_of_string. The default is string. The *attributes* is itself a list that can have any of the following entries:

- "required" - This argument must be specified. This attribute is mutually exclusive with optional.
- "optional" - Specifying this argument is optional. This attribute is mutually exclusive with required.
- "value_help" - Indicates that the valid values for a one_of_string argument should be listed whenever argument help is shown.

- "values {<list of allowable values>}" - If the argument type is one_of_string, you must specify the "values" attribute.
- "merge_duplicates" - When this option appears more than once in a command its values are concatenated into a list of values. The default behavior is that the right-most value for the option specified is used.
- "remainder" - Specifies that any additional positional arguments should be returned in this option. This option is only valid for string option types, and by default the option is optional. You can require at least one item to be specified by also including the required option.
The default for attributes is "required".

Change the command group of the procedure using **-command_group**. Protect the contents of the procedure from being viewed by using **-hide_body**. Prevent further modifications to the procedure by using **-permanent**. Prevent abbreviation of the procedure by using **-dont_abbrev**.

EXAMPLES

The following procedure adds two numbers together and returns the sum. For demonstration purposes, unused arguments are defined.

```

prompt> proc plus {a b} {return [expr $a + $b]}
prompt> define_proc_attributes plus -info "Add two numbers"
? -define_args { {a "first addend" a string required}
                {b "second addend" b string required}
                {"-verbose" "issue a message" "" boolean optional}}
prompt> help -verbose plus
Usage: plus      # Add two numbers
      [-verbose]          (issue a message)
      a                  (first addend)
      b                  (second addend)
prompt> plus 5 6
11

```

In the following example, the procedure argHandler accepts an optional argument of each type supported by **define_proc_attributes**, then displays the options and values received.

```

proc argHandler {args} { parse_proc_arguments -args $args results
    foreach argname [array names results] { echo $argname = $results($argname)
    }
}

define_proc_attributes argHandler
    -info Arguments processor
    -define_args { {-Oos oos help AnOos one_of_string
                    {required value_help {values {a b}}}}}

define_proc_attributes

```

```
{-Int int help AnInt int optional}
{-Float float help AFloat float optional}
{-Bool "bool help" boolean optional}
{-String "string help" AString string optional}
{-List "list help" AList list optional}}
{-IDup int dup AIDup int {optional merge_duplicates}}}
```

SEE ALSO

`help(2)`
`info(2)`
`sh_command_abbrev_mode(3)`

define_routing_rule

Defines design-specific, nondefault routing rules that are stored in the design database.

SYNTAX

```
status define_routing_rule
rule_name
-reference_rule_name ref_rule_name
  | -default_reference_rule
[-widths layer_name_and_width_pairs]
[-snap_to_track]
[-spacings layer_name_and_spacing_pairs]
[-shield_widths layer_name_and_shield_width_pairs]
[-shield_spacings layer_name_and_shield_spacing_pairs]
[-via_cuts via_name_and_cut_number_pairs]
[-taper_level tapering_level]
[-multiplier_width layer_width]
[-multiplier_spacing layer_spacing]
```

Data Types

rule_name	string
ref_rule_name	string
layer_name_and_width_pairs	string
layer_name_and_spacing_pairs	string
layer_name_and_shield_width_pairs	string
layer_name_and_shield_spacing_pairs	string
via_name_and_cut_number_pairs	string
tapering_level	float
layer_width	float
layer_spacing	float

ARGUMENTS

rule_name

Specifies the name for the new nondefault routing rule. Substitute the name you want for rule_name.

-reference_rule_name ref_rule_name

Specifies the name of the reference (source) rule. Substitute the library-specific or design-specific name you want for ref_rule_name. The **-reference_rule_name** and **-default_reference_rule** options are mutually exclusive; you must specify only one. By default, the command uses the default routing rule as the reference rule.

-default_reference_rule

Specifies to use the default routing rule as the reference rule. The **-reference_rule_name** and **-default_reference_rule** options are mutually exclusive; you must use only one.

-widths layer_name_and_width_pairs
 Specifies a list of that defines the routing width for each named routing layer. Each entry in the list is comprised of a routing layer name and its width (in microns), separated by a space. The width portion of the pair is a floating point number. For your own convenience, you may enclose the entire list in curly braces {}. The command sets width based on the **-reference_rule_name** setting for layers that are not listed in the option.

-snap_to_track
 Snaps the shielding wires to the track.

-spacings layer_name_and_spacing_pairs
 Sets the minimum different-net spacing allowed between wires for each named routing layer. Each entry in the list is comprised of a routing layer name and its spacing (in microns), separated by a space. The spacing portion of the pair is a floating point number. For your own convenience, you may enclose the entire list in curly braces {}. The command sets spacing based on the **-reference_rule_name** setting for layers that are not listed in the option.

-shield_widths layer_name_and_shield_width_pairs
 Specifies a list that defines the shielding width for named routine layers. Each entry in the list is comprised of a routing layer name and its shielding width (in microns), separated by a space. The shielding width portion of the pair is a floating point number. For your own convenience, you may enclose the entire list in curly braces {}. The command sets shielding width based on the **-reference_rule_name** setting for layers that are not listed in the option.

-shield_spacings layer_name_and_shield_spacing_pairs
 Sets the minimum shield spacing allowed between wires for the named routing layer. Each entry in the list is comprised of a routing layer name and its shielding spacing (in microns), separated by a space. The shielding spacing portion of the pair is a floating point number. For your own convenience, you may enclose the entire list in curly braces {}. The command sets shielding spacing based on the **-reference_rule_name** setting for layers that are not listed in the option.

-via_cuts via_name_and_cut_number_pairs
 Creates vias automatically during routing, given the routable via name and the horizontal and vertical cut count numbers. Each entry in the list is comprised of a via name and its cut number, separated by a space. The cut_number portion of the pair is in the format mXn or mxn, where *m* is the horizontal cut number and *n* is the vertical cut number, separated by the character **x** or **X**. For your own convenience, you may enclose the entire list in curly braces {}.
 If you do not specify a cut number value, the tool uses a via size based on the wire width. You must ensure that the routable via exists in the reference routing rule; otherwise, the command fails. If you define more than one via for the same layer level, the command generates an error (RT-038) and fails. For example: the command will fail if you specify two vias for **metal1** and **metal2**.

-taper_level tapering_level
 Defines the tapering level. You can specify a tapering level from **-1** to *N* (where *N* is a positive number). To use pin based tapering, set the

tapering_level argument to **0**. For no tapering at any pins and to overwrite router parameters, set *tapering_level* to **1**. To use fanout-based tapering and up to *N* different widths, set *tapering_level* to *N*. In this case, the default width is used at the input pin and the maximum width (the width defined in the routing rule) is used at the output pin and at the top-cell pin.

-multiplier_width *layer_width*

Defines the layer width with a multiplier specified by the *layer_width* argument. You do not have to know the units and exact metal width currently defined in the library. For example, to define double width, you can specify value **2.0**.

-multiplier_spacing *layer_spacing*

Defines the layer spacing with a multiplier specified by the *layer_spacing* argument. It is similar as above, user just specify a multiplier for spacing. You do not have to know the units and exact layer spacing currently defined in the library.

DESCRIPTION

This command defines design-specific, nondefault routing rules that are stored in the design database.

Use the **define_routing_rule** command to define width and spacing rules and the via types associated with them, as needed, without predefining them in the physical library.

Use the **set_net_routing_rule** command to assign to specific nets any nondefault routing rules that are defined with the **define_routing_rule** command or those defined in the physical library.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines a nondefault rule named *new_rule* that uses the default routing rules for a reference rule:

```
prompt> define_routing_rule new_rule \
-default_reference_rule -widths {m1 0.8 m4 0.9} \
-spacings {m1 1.0 m4 1.0}
```

The following example reports the nondefault rule named *new_rule*:

```
prompt> define_routing_rule new_rule \
prompt> report_routing_rules new_rule.in -0.25in
```

SEE ALSO

`remove_routing_rules(2)`

define_scaling_lib_group

Defines a scaling library group to support voltage and/or temperature scaling.

SYNTAX

```
status define_scaling_lib_group
[-name name]
[lib_file_names]
```

Data Types

<i>name</i>	string
<i>lib_file_names</i>	list

ARGUMENTS

-name *name*

Specifies a name for the scaling library group. The name can be used in a subsequent **set_scaling_lib_group** command.

lib_file_names

Specifies the set of library files that comprise the scaling library group. Use file names to ensure they can be found using **search_path**.

DESCRIPTION

The **define_scaling_lib_group** command defines a group of libraries that the tool uses for interpolation for voltage and/or temperature scaling.

You can define more than one group to cover different portions of a design, but the groups cannot share libraries. Each library can only be part of one scaling library group.

A minimum of two libraries is required for one-dimensional scaling, such as voltage or temperature. A minimum of four libraries is required for two-dimensional scaling, such as voltage and temperature.

The scaling library group defined in the current session will not be written back to the design. In the new session, the same scaling library group settings must be manually reapplied.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines a scaling library group for two voltage domains about the nominal:

```
define_scaling_lib_group
630
```

```
prompt> define_scaling_lib_group -name g1 {0.9.db 1.1.db 1.3.db}
```

SEE ALSO

```
create_scenario(2)
remove_scaling_lib_group(2)
set_operating_conditions(2)
set_scaling_lib_group(2)
```

define_user_attribute

Defines a new user-defined attribute.

SYNTAX

```
int define_user_attribute
-type data_type
-class class_list
[-range_min min]
[-range_max max]
[-one_of values]
[-quiet]
attr_name
```

Data Types

<i>data_type</i>	string
<i>class_list</i>	values
<i>min</i>	double
<i>max</i>	double
<i>values</i>	list
<i>attr_name</i>	string

ARGUMENTS

-type *data_type*
Specifies the data type of the attribute. The supported data types are **string**, **int**, **float**, **double**, and **Boolean**.

-class *class_list*
Specifies the list of class names for the user-defined *attr_name* attribute.
Valid classes are design, port, cell, net, etc.

-range_min *min*
Specifies the minimum value for numeric ranges. This option is valid only when the **-type** *data_type* is **int** or **double**. Specifying a minimum constraint without a maximum constraint creates an attribute that accepts a value greater than or equal to *min*.

-range_max *max*
Specifies the maximum value for numeric ranges. This option is valid only when the **-type** *data_type* is **int** or **double**. Specifying a maximum constraint without a minimum constraint creates an attribute that accepts a value less than or equal to *max*.

-one_of *values*
Provides a list of allowable strings. This option is valid only when the data type is **string**.

-quiet
Turns off the warning message that would otherwise be issued if the attribute or classes are improper.

```
attr_name
    Specifies the name of the attribute.
```

DESCRIPTION

This command defines a new attribute. Use the **list_attributes** command to list the attributes that you have defined. The return value is set to **1** if the operation is successful; otherwise, it is set to **0**.

The definition for a user-defined attribute can be persistent if it has been operated on to a specified object and stored into the database.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example defines *attr_1* as greater than or equal to **2** and less than or equal to **3.2** on **cell** and **net** classes:

```
prompt> define_user_attribute -class {cell net} -type double \
-range_max 3.2 -range_min 2 attr_1
Info:User-defined attribute 'attr_1' on class 'cell'.
Info:User-defined attribute 'attr_1' on class 'net'.
1
```

The following example defines *attr_2* to **string** with a value of either **true** or **false** on **net** class:

```
prompt> define_user_attribute -class net -type string \
-one_of {true false} attr_2
Info:User-defined attribute 'attr_2' on class 'net'.
1
```

The following example shows how to list the attribute definitions using the **list_attributes** command:

```
prompt> list_attributes
*****
Report : List of Attribute Definitions
Design :
Version:
Date   : Mon Dec 22 17:08:51 2003
*****
```

Properties:

- A - Application-defined
- U - User-defined
- I - Importable from db (for user-defined)

Attribute Name	Object	Type	Properties	Constraints
----------------	--------	------	------------	-------------

```
-----  
attr_1           cell    double   U      2 to 3.2  
attr_1           net     double   U      2 to 3.2  
attr_2           net     string   U      true, false
```

define_via

Creates a special via that is not defined in the physical library.

SYNTAX

```
int define_via
via_name
-rect {layer_name X1 Y1 X2 Y2}
```

ARGUMENTS

`via_name`
Specifies the name of a special via.

`-rect {layer_name X1 Y1 X2 Y2}`
Defines layer geometries for the via. You can specify multiple `-rect` options. Each one specifies a rectangle on layer `layer_name`. The list for the option starts with `layer_name` followed by four x y coordinates: one set for the lower-left corner and the other for the upper-right corner. Coordinates are in micron units.

DESCRIPTION

Creates a special via that is not defined in the physical library. The created via is added into VIA_DEF (see pdef file) for the current design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command creates a via between layers named `METAL1` and `METAL2`.

```
prompt> define_via my_via12 -rect \
{METAL1 1 1 4 4} -rect {CUT12 2 2 3 3} \
-rect {METAL2 1 1 4 4}
```

SEE ALSO

`create_net(2)`
`report_net(2)`

define_zrt_redundant_vias

Sets options for redundant via insertion.

SYNTAX

```
status define_zrt_redundant_vias
[-from_via {list_of_from_vias}]
[-to_via {list_of_to_vias}]
[-to_via_x_size {list_of_contact_numbers}]
[-to_via_y_size {list_of_contact_numbers}]
[-to_via_weights {list_of_weights}]
```

Data Types

<i>list_of_from_vias</i>	list of strings
<i>list_of_to_vias</i>	list of strings
<i>list_of_contact_numbers</i>	list of integers
<i>list_of_weights</i>	list of integers

ARGUMENTS

```
-from_via {list_of_from_vias}
    Specifies the vias to be replaced during redundant via insertion.
    The default value is an empty list.

-to_via {list_of_to_vias}
    Specifies the vias to be inserted during redundant via insertion.
    The default value is an empty list.

-to_via_x_size {list_of_contact_numbers}
    Specifies the number of contacts for the vias inserted during redundant via
    insertion.
    The default value is an empty list.

-to_via_y_size {list_of_contact_numbers}
    Specifies the number of contacts for the vias inserted during redundant via
    insertion.
    The default value is an empty list.

-to_via_weights {list_of_weights}
    Specifies the weights of contacts for the vias inserted during redundant via
    insertion. The weight is an integer between 1 and 10 (inclusive). Via mappings
    having higher weight are preferred over via mappings having lower weight.
    The default value is 1 for all via mappings.
```

DESCRIPTION

The **define_zrt_redundant_vias** command sets options for redundant via insertion.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example sets the options for via replacement with double vias:

```
prompt> define_zrt_redundant_vias -from_via {via1 via2} \
-to_via_x_size {1 1} -to_via_y_size {2 2}
```

SEE ALSO

`insert_zrt_redundant_vias(2)`

delete_operating_conditions

Deletes a specific set of operating conditions from a library.

SYNTAX

```
status delete_operating_conditions  
-library library_name  
-name op_cond_name
```

Data Types

<i>library_name</i>	string
<i>op_cond_name</i>	string

ARGUMENTS

-library <i>library_name</i>	Specifies the name of the library that stores the operating conditions.
-name <i>op_cond_name</i>	Specifies the name of the set of operating conditions.

DESCRIPTION

The **delete_operating_conditions** command deletes a specific set of operating conditions from the specified library.

To create a new set of operating conditions, use the **create_operating_conditions** command.

To set operating conditions on the current design, use the **set_operating_conditions** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example deletes a specific set of operating conditions called BEST in the a_lib library.

```
prompt> delete_operating_conditions -library a_lib -name BEST
```

SEE ALSO

create_operating_conditions(2)
set_operating_conditions(2)

delete_operating_conditions

638

derive_constraints

Propagates design environment, constraints, and attribute settings from the top-level design to the specified subdesigns.

SYNTAX

```
int derive_constraints
[-attributes_only]
[-verbose]
[-budget]
cell_list
```

ARGUMENTS

-attributes_only

Propagates only the attributes. By default, both constraints and attributes are propagated.

-verbose

Enables additional messages during propagation.

-budget

Performs RTL budgeting to come up with delay constraints.

cell_list

Specifies the list of cells to which the environment is to be propagated. The following validations are performed on the specified cells:

- Cell is hierarchical
- Cell is unique or is a master instance
- Reference design is in Design Compiler memory

DESCRIPTION

Propagates design environment, constraints, and attribute settings from the top-level design to the specified subdesigns. Although this command works on both mapped and unmapped designs, design budgeting provides more accurate constraints for mapped designs.

This command uses the **target_library** variable. Ensure that this variable is set before running the command.

Multicorner-Multimode Support

This command uses information from the current scenario only.

SEE ALSO

`write_environment(2)`
`target_library(3)`

derive_mpc_macro_options

Derives placement constraints for a specific macro or derives macro array constraints for a group of macros.

SYNTAX

```
int derive_mpc_macro_options
[-output filename]
[-append]
[-array]
[-footprint]
[-array_name array_name]
[-location {exact | anchor_bound | anchor_offset | anchor_orient | none}]
[-apply]
[-verbose]
list_of_macros
```

ARGUMENTS

-output *filename*
Specifies the file where the derived scripts are written. If this option is not specified, the tool applies the derived constraints directly on the design.

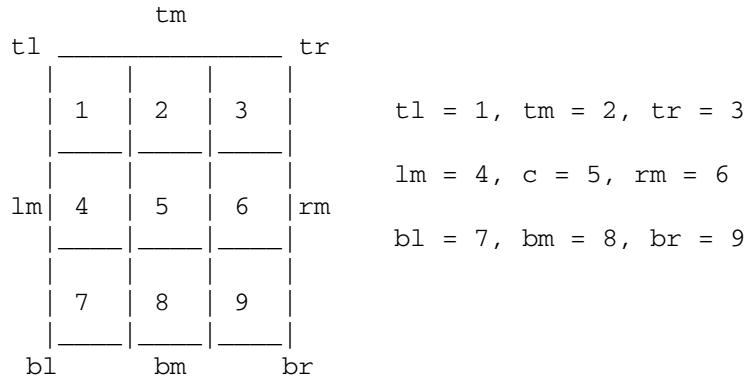

-append
Appends to the current file without overwriting it. If this option is not specified, the current file is overwritten.

-array
Derives the given macros as a macro array. The name of the array can be given by the **-array_name** option. If **-array_name** is not specified, the tool generates a random name. This option is only valid when more than one macro is selected. The tool scans the current macro locations to determine the array structure. The **set_mpc_macro_array** command is written out to specify the macro array. If the placement is too irregular to be recognized as an array, the tool does not finish deriving macro array and quits. Use the **-verbose** option to see how the tool looks at the possible array structure.

-footprint
Allows multiple orientations with the same footprint.

-array_name *array_name*
Specifies the name for the macro array. It implies the **-array** flag if **-array** is not specified.

-location {exact | anchor_bound | anchor_offset | anchor_orient | none}
Specifies how to derive the location constraint for a specific macro or the derived macro array (with **-array** specified). For one macro cell, the **exact** value extracts the macro location and orientation by **set_cell_location**, **rotate_objects -to** and **set_dont_touch_placement**. For other options, the appropriate **set_mpc_macro_options** are written. The **anchor_bound** value derives the **anchor_bound** constraint for a macro (**-anchor_bound**).

The **anchor_bound** is determined per the 9 regions shown above. The center of the cell falls into one of the regions and that region will be the **anchor_bound** for this cell. The **anchor_offset** value derives **anchor_bound** and the offset distance to the concerned anchor point (**-anchor_bound**, **-x_offset**, and **-y_offset**). The **anchor_orient** value derives **anchor_bound** and orientation (**-anchor_bound**, **-legal_orientation**).

For a macro array, the bounding box (including all macros) is used like the cell box to determine **anchor_bound** or offset for the array. The **set_mpc_macro_options** *array_name* is output. Only **anchor_bound** and **anchor_offset** are valid for macro array. The **none** value directs the tool to not to write any macro constraints regarding the location. The default for this option is **none**.

-apply

Directly annotate the derived constraints to design objects.

-verbose

Sets debug mode in which the tool will print more information on input and output data.

list_of_macros

Specifies the macros to derive constraints for. This is a required argument.

DESCRIPTION

This command derives placement constraints for a specific macro or macro array constraints for a group of macros. The **-array** option can be used with or without the **-location** option. With **-location**, the tool derives **anchor_bound** or **anchor_offset** for the macro array. Without **-location**, the location of the macro array is irrelevant.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example shows how to derive a macro array for *RAM1*, *RAM2*, and *RAM3*:

```
prompt> derive_mpc_macro_options [get_cells RAM1 RAM2 RAM3] \
      -array my_ram_array -location anchor_bound
```

SEE ALSO

```

derive_mpc_options

Derives design level floorplan information and generic information for the ports and macros.

SYNTAX

```
int derive_mpc_options
[-output filename]
[-append]
[-origin ll | center]
[-core exact | relative | height_only | width_only]
[-pnets exact | model | none]
[-ports exact | relative | side | none]
[-macros exact | anchor_bound | anchor_orient | anchor_offset | none]
[-footprint]
[-corner_keepout exact | relative | none]
[-apply]
[-verbose]
```

Data Types

filename string

ARGUMENTS

```
-output filename
    Specifies the file where the derived scripts are written. If this option is
    not specified, the tool applies the derived constraints directly on the
    design.

-append
    Appends to the current file without overwriting it. If this option is not
    specified, the current file is overwritten.

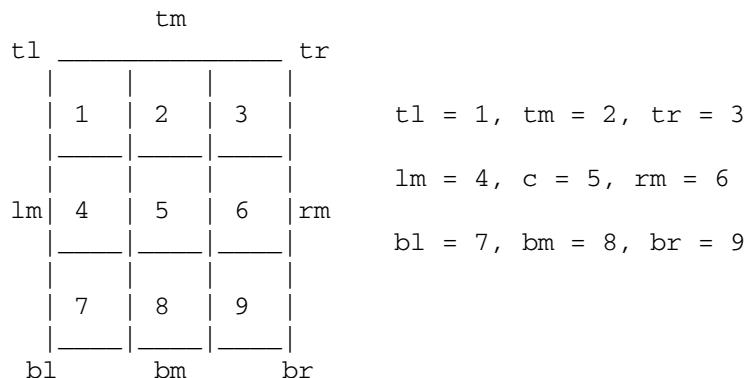

-origin ll | center
    Specifies how to derive origin of the core area. The values are either ll
    (lower-left) or center. The coordinates of the lower-left corner are output
    to the set_mpc_option -origin {x y} command. If center is specified,
    set_mpc_option -shift_to_center is added. If there is a die area, -io_margin
    options are also output. The default is ll.

-core exact | relative | height_only | width_only
    Specifies how to derive the core area. The valid values exact, relative,
    width_only, and height_only. The set_mpc_option command is written out to
    reflect the appropriate options specified. The exact value writes out the
    physical size of the core width and height (-core_width, -core_height). The
    relative value writes out the core parameters in the form of utilization and
    aspect ratio (-utilization and -aspect_ratio). If height_only or width_only
    are specified, the corresponding parameter (height or width) is output along
    with the utilization factor. The default for this option is relative.
```

-pnets exact | model | none
 Specifies to derive the current floorplan power grid environment. The **exact** value writes out the exact pnet topology with **create_net -only_physical**, **create_routing_path**, and **define_via** commands. The **model** value derives pnet patterns and outputs the **set_mpc_pnet_options** command for each pnet object. The **none** value directs the tool to not write out any commands to represent pnet. The default value for this option is **model**.

-ports exact | relative | side | none
 Specifies how to derive port location constraints. The **exact** value writes out the exact port location and port shape to the **set_port_location** command. The **relative** value writes out the relative coordinates (which are a percentage of the core width or core height) and the layer, if defined. The **set_mpc_port_options -coordinate -layer** command is used to reflect the information. The **side** value extracts the side where the port is located and the layer, if defined. The **set_mpc_port_options -side -layer** command is written out. The **none** value directs the tool to not write out the port constraints. The default for this option is **side**.

-macros exact | anchor_bound | anchor_orient | anchor_offset | none
 Specifies how to derive all of the macros in the current floorplan environment. The **exact** value extracts macro location and orientation by the **set_cell_location**, **rotate_objects -to**, and **set_dont_touch_placement** command. For other options, the appropriate **set_mpc_macro_options** are written. The **anchor_bound** value derives the **anchor_bound** constraint for a macro (**-anchor_bound**).

The **anchor_bound** is determined by the 9 regions shown above. The center of the cell falls into one of the regions and that region is the **anchor_bound** for this cell. The **anchor_offset** value derives **anchor_bound** and the offset distance to affected anchor point (**-anchor_bound**, **-x_offset**, **-y_offset**). The **anchor_orient** value derives **anchor_bound** and orientation (**-anchor_bound**, **-legal_orientation**). The **none** value directs the tool not to write macro constraints. The default value for this option is **anchor_bound**.

-footprint
 Allows multiple orientations with the same footprint.

-corner_keepout exact | relative | none
 Specifies how to derive port keepouts for corners of the floorplan. The **set_mpc_options -corner_keepout** is written out. The **exact** value directs the tool to keep the actual distance for each corner to the closest port in the

horizontal and vertical direction as the corner keepout. The **relative** value uses the same principle, except the distance is not absolute; it is turned into a percentage of the core height or width. The **none** option does not extract a corner keepout constraint. The default value for this option is **none**.

-apply

Specifies to directly annotate the derived constraints to design objects.

-verbose

Sets debug mode in which the tool prints more information on input and output data.

DESCRIPTION

This command derives design level physical constraints and generic information for port and macro locations. The input for this command is a design with floorplan and/or placement information. The output of this command is a script file containing commands to set physical constraints. Switches in this command specify how to derive this information. For ports and macros, this command only concerns generic location constraints for all of the ports or macros. For an individual port, port group, macro, or macro array, use the **derive_mpc_port_options** or the **derive_mpc_macro_options** command.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example shows how to derive a floorplan for the current design. This involves utilization and aspect ratio for the core area. Since the **-port side** and **-macros anchor_bound** are the required settings and these are also the defaults, the following command meets the requirements:

```
prompt> derive_mpc_options
```

This following command set produces the same results as the example above:

```
prompt> derive_mpc_options -core relative -origin 11 \
-ports side -macros anchor_bound
```

SEE ALSO

```
create_placement(2)
derive_mpc_port_options(2)
derive_mpc_macro_options(2)
report_mpc_macro_options(2)
report_mpc_options(2)
report_mpc_port_options(2)
```

derive_mpc_options

```
set_mpc_macro_options(2)
set_mpc_options(2)
set_mpc_port_options(2)
```

derive_mpc_port_options

Derives the physical constraints for a specific port or a group of ports.

SYNTAX

```
int derive_mpc_port_options
[-output filename]
[-append]
[-group]
[-group_name group_name]
[-order]
[-location {exact | relative | side | none}]
[-apply]
[-verbose]
port_list
```

Data Types

<i>filename</i>	string
<i>group_name</i>	string
<i>port_list</i>	list or collection

ARGUMENTS

-output *filename*
Specifies the file where the derived scripts will be written. This is an optional option. If not specified, the tool will apply the derived constraints on design directly.

-append
Indicates to append to the current file and not to overwrite it. If this options is not specified then the current file will be written over.

-group
Specifies to derive port group constraint for the given ports. -group_name can be used to specify the name for the port group. The set_mpc_port_options command will be written out to place the selected ports as a group. To be a group, the selected ports should be on same side. If they are not on same side, the tool will error out with error message. Space between port will be checked and if they are not evenly spaced, the minimum space will be used as port group pitch.

-group_name *group_name*
Specifies the name for the derived port group. It implies -group flag.

-order
Indicates to derive the order between the group of ports. The ports in output command set_mpc_port_options will be ordered per clockwise or counter-clockwise according to their current locations.

-location {exact | relative | side | none}
Specifies how to derive port location constraint. If concern is individual

port (without -group), The 'exact' option writes out the exact port location and port shape to command set_port_location. The 'relative' option writes out the relative coordinates (being a percentage of the core/die width or core height) and port shape if defined. Command set_mpc_port_options -coordinate will be used to reflect these information. The 'side' option will extract the side where the port is located and port shape if defined.
set_mpc_port_options -side will be written out. If concerned is a port group (with -group), the option of -location relative | exact derives start_location for the port group. No port shape will be derived. The 'none' option directs the tool not to write out port constraints or not to write -start_location for a port group. The default for this switch is none.

-apply

Directly annotate the derived constraints to design objects.

-verbose

Sets debug mode in which the tool will print more information on input and output data.

port_list

Specifies the ports to derive constraints for. This is a required argument.

DESCRIPTION

This command will be used to specify more specific constraints regarding a port or a group of ports. Group cannot occur across the corner of the core area. If a user tries this, an error will be issued. User should perform multiple group extraction if ports are along the corners. The group can be used with location or without location. With location, this option will tell the group startpoint in the constraint (-start_location) to be an exact or relative coordinate. Without -location, start_location is not cared.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example shows how to derive a bus pin group DATA[0-9].

```
prompt> derive_mpc_port_options [get_port DATA*] -group -order -location relative
```

derive_pg_connection

Connects power and ground pins and tie-off pins to the power and ground nets. It supports both manual mode, where you specify the power and ground nets, and automatic mode, where the tool derives the power and ground nets from the power domain connections. Automatic mode is supported only for multivoltage designs with UPF descriptions and requires logic libraries with power and ground pins.

SYNTAX for Manual Mode

```
status derive_pg_connection

[-tie]
[-power_net net_name]
[-ground_net net_name]
[-power_pin pin_name]
[-ground_pin pin_name]
[-cells cells]
[-create_ports none | top | all]
```

Data Types

<i>net_name</i>	string
<i>pin_name</i>	string
<i>cells</i>	collection

SYNTAX for Automatic Mode

```
status derive_pg_connection

[-create_nets]
[-tie]
[-all]
[-reconnect]
[-verbose]
```

ARGUMENTS

-tie

Connects the tie-high and tie-low pins. The power and ground network must exist prior to connecting the tie-high and tie-low pins.

In manual mode, the tool connects the tie-off pins to the power and ground nets specified in the **-power_net** and **-ground_net** options, respectively.

In automatic mode, the tool connects the tie-off pins to the proper power nets based on the power connections of their cell instances. A tie-high pin follows the connection of its related power pin if the **related_power_pin** attribute is defined on the pin in the library cell; otherwise, the tie-high pin of a regular cell is connected to the primary power net of the cell's power domain and the tie-high pin of an always-on cell is connected to the backup power net.

The **-tie** option is mutually exclusive with the **-all** option; you can specify only one. If you do not specify either option, **derive_pg_connection** connects

only the power and ground pins.

-power_net net_name
Specifies the name of the power net to use for power and tie-high connections. Using this option invokes the tool in manual mode.

-ground_net net_name
Specifies the name of the ground net to use for ground and tie-low connections. Using this option invokes the tool in manual mode.

-power_pin pin_name
Specifies the name of the power pin on the cells specified in the **-cells** option to connect to the net specified in the **-power_net** option.

-ground_pin pin_name
Specifies the name of the ground pin on the cells specified in the **-cells** option to connect to the net specified in the **-ground_net** option.

-cells cells
Specifies the cells to connect to the power and ground nets specified by the **-power_net** and **-ground_net** options, respectively.

-create_ports none | top | all
Creates ports for the nets specified by the **-power_net** and **-ground_net** options.
Valid values for this option are
* **none** (the default)
Does not create any ports.

* **top**
Creates only a top-level port.

* **all**
Creates a top-level port and ports as needed on child cells.

-create_nets
Creates power and ground nets based on the power domain definitions and supply nets. If multiple supply nets are connected through supply ports, only one power net is created with the name following the supply net inside the highest logic hierarchy.
This option is valid only in automatic mode. It is ignored if either **-power_net** or **-ground_net** is used.

-all
Connect both power and ground pins and tie-off pins.
The **-all** option is mutually exclusive with the **-tie** option; you can specify only one. If you do not specify either option, **derive_pg_connection** connects only the power and ground pins.
This option is valid only in automatic mode and has no effect on tie-off connections. It is ignored if either **-power_net** or **-ground_net** is used.

-reconnect
Reconnects power and ground pins that have existing connections.
By default, the command works only on unconnected power and ground pins.
When you specify this option, the command works on all power and ground pins

of the design, whether or not they have existing connections. This option is valid only in automatic mode and has no effect on tie-off connections and physical only cells. It is ignored if either **-power_net** or **-ground_net** is used.

-verbose

Prints the details of the changes to the power and ground or tie-off connections.

DESCRIPTION

This command creates the power and ground network for your design by connecting the power and ground pins and the tie-off pins to the power and ground nets in your design.

The command supports two modes: manual mode and automatic mode. In manual mode, you use the **-power_net** and **-ground_net** options to specify the power and ground nets. Using at least one of these options invokes the tool in manual mode. You can use manual mode for single-voltage or multivoltage designs.

In automatic mode, the tool derives the power and ground nets from the power domain connections. At a minimum, each power domain has a primary power net and a primary ground net. A power domain might also have backup power and ground nets. You can use automatic mode only for UPF multivoltage designs. In addition, automatic mode requires logic libraries with power and ground pins. In automatic mode, the tool can create the power and ground nets, if they do not already exist.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **derive_pg_connection** in automatic mode to connect all unconnected power and ground pins based on the power domain connections.

```
prompt> derive_pg_connection
```

```
Power/Ground Connection Summary:
```

P/G net name	P/G pin count (previous/current)

Power net "VDD":	0/2547
Power net "VDDM":	0/4798
Power net "VDDI":	200/250
Unconnected power pins:	7395/0

Ground net "VSS":	6368/7368
Unconnected ground pins:	1000/0

```
Information: connections of 8395 power/ground pin(s) are created or changed.
```

The following example uses **derive_pg_connection** in manual mode to connect all unconnected power pins to VDD and and unconnected ground pins to VSS.

```
prompt> derive_pg_connection -power_net VSS -ground_net VDD
```

detect_flcc_hotspot

Performs lithography hot spot detection. FLCC stands for Fast Lithography Compliance Check.

SYNTAX

```
detect_flcc_hotspot
[-cell_name
```

Data Types

cName string

ARGUMENTS

-cell_name *cName*

Specifies the cell name in which the detected flcc hotspots info will be stored. It is a Milkyway CEL view cell and is used exclusively to store flcc hotspot info, similar to drc error cell. User can use ICC error browser to open it and the flcc hotspots will be classified according to its categories. If this param is not specified, the flcc hotspot info will be stored in original top cell. If user opens the top cell with error browser, user still can view these flcc hotspots, but no category classification is supported.

DESCRIPTION

The command `detect_flcc_hotspot` requires two files to execute, `hotSpots.ev` and `hotSpots.util`. User should have these two files in the working directory before running this command.

If flcc errors are not stored in original top cell, it will facilitate user to browse and compare the flcc errors before and after fixing. The param `-cell_name` is used to store flcc errors. The error cell is a Milkyway CEL view cell, and only contains error types, error objects and related descriptions.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command performs `detect_flcc_hotspot`.

```
prompt> detect_flcc_hotspot -cell_name A
```

SEE ALSO

`extract_flcc_hotspot(2)`

```
fix_flcc_hotspot(2)
```

```
detect_flcc_hotspot  
656
```

detect_lcc_hotspot

Performs full-chip lithography compliance check (LCC) hotspot detection.

SYNTAX

```
status detect_lcc_hotspot
-lcc_file_path lcc_path_name
-layers list_of_layers
[-dp_hosts list_of_dp_hosts]
```

Data Types

<i>lcc_path_name</i>	string
<i>list_of_layers</i>	list
<i>list_of_dp_hosts</i>	list

ARGUMENTS

```
-lcc_file_path lcc_path_name
    Specifies a directory of LCC files, which contains necessary runsets needed
    by full-chip LCC detection jobs. The lcc_path_name value must be a full path.

-layers list_of_layers
    Specifies the layers to run full-chip LCC detection.

-dp_hosts list_of_dp_hosts
    Specifies the machines to be used. This option is required, unless you have
    a .dprc file under the working directory or you use the -lcc_file_path option,
    which also specifies the machines to be used. The value of the -dp_hosts
    option overrides the presence of a .dprc file.
```

DESCRIPTION

This command performs full-chip LCC detection. It outputs two fix guidance files under the working directory. These two files contain hotspot information and are necessary to run the **fix_lcc_hotspot** command. Full-chip LCC detection has a long run time, and using distributed processing is a requirement.

You should specify the machines to be used by the **-dp_hosts** option, or the .dprc file under the working directory, or the .dprc file specified under the *lcc_path_name* directory. If you do not do this, the command will not run and will not report an error.

The distributed processing engine used by the **detect_lcc_hotspot** command is different from that used by the **fix_lcc_hotspot** command and many other routing commands. You do not need to run the **set_distributed_route** command before running the distributed processing **detect_lcc_hotspot** command. If you run **set_distributed_route** before attempting to run **detect_lcc_hotspot**, you should run the **remove_distributed_route** command to release network resources; otherwise, the communication port between machines might become occupied and block distributed processing functionality.

An error cell named "<top_cell_name>_lcchs.err" will be created after running the **detect_lcc_hotspot** command. You can open this error cell to browse the hotspots in the current design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the command running on multiple layers and multiple Linux hosts.

```
prompt> detect_lcc_hotspot\  
-lcc_file_path /LCC/full-chip\  
-layers {M2 M3 M4}\  
-dp_hosts {lin1 lin2 lin3 lin4 lin5 lin6 lin7 lin8}
```

SEE ALSO

```
fix_lcc_hotspot(2)  
report_lcc_hotspot(2)
```

disconnect_net

Disconnects a net from pins or ports.

SYNTAX

```
status disconnect_net
net
object_list | -all
```

Data Types

net	string
object_list	list

ARGUMENTS

net

Specifies the net name or net instance name to disconnect. A net must exist in the current design.

object_list

Specifies the pins and ports disconnected from the net. Only pins and ports existing in the current design are specified. Either *object_list* or **-all** must be specified.

-all

Specifies to break all connections on the net. Either **-all** or *object_list* must be specified.

DESCRIPTION

The **disconnect_net** command breaks the connections between a net or a net instance and its pins or ports. The net, pins, and ports are not removed.

This command accepts only scalar (single bit) nets, but not bused nets.

`disconnect_net` can be used to disconnect PG or Tie nets from connected pins also.

To connect nets, use the **connect_net** command. To display the pins and ports connected to a net, use the **all_connected** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples disconnect nets using the **disconnect_net** command:

```
prompt> disconnect_net NET0 [get_ports A1]
Disconnecting net 'NET0' from port 'A1'.
```

```
prompt> disconnect_net NET0 [get_pins U1/A]
Disconnecting net 'NET0' from pin 'U1/A'.
```

The following example breaks all connections on a net using the **disconnect_net** command:

```
prompt> disconnect_net MY_NET_1 -all
Disconnecting net 'MY_NET_1' from port 'PORT1'.
```

```
prompt> all_connected [get_nets MY_NET_1]
```

SEE ALSO

`all_connected(2)`
`connect_net(2)`
`create_net(2)`
`current_design(2)`
`remove_net(2)`

disconnect_power_net_info

Removes the exceptional power net information hookups with the power pin.

SYNTAX

```
status disconnect_power_net_info
object_list
-power_pin_name power_pin_name
```

Data Types

<i>object_list</i>	list
<i>power_pin_name</i>	string

ARGUMENTS

<i>object_list</i>	Specifies a list of leaf cells for which the exceptional power net information connections are being removed.
<i>-power_pin_name power_pin_name</i>	Specifies the name of the power pin information.

DESCRIPTION

The **disconnect_power_net_info** command removes exceptional power connections for a specific power pin information of a leaf cell. After an exceptional power connection is removed, it inherits the domain-wise power hookup from the domain to which it belongs.

See the **report_power_pin_info** man page for more information.

EXAMPLES

The following example makes and then removes an exceptional power hookup:

```
prompt> connect_power_net_info PDO_INST/I0 \
          -power_pin_name PWR -power_net_name exp_VDD
1
prompt> disconnect_power_net_info PDO_INST/I0 -power_pin_name PWR
1
```

SEE ALSO

connect_power_net_info(2)
report_power_pin_info(2)

display_flip_chip_route_flylines

Displays flylines of flip-chip nets in the layout view of the IC Compiler GUI.

SYNTAX

```
status display_flip_chip_route_flylines
[-nets | -nets_in_file nets_file]
[-open_nets [-output_open_nets open_net_file]]
```

Data Types

<i>collection_of_nets</i>	collection
<i>nets_file</i>	string
<i>open_net_file</i>	string

DATA TYPES

<i>collection_of_nets</i>	collection
<i>nets_file</i>	string
<i>open_net_file</i>	string

ARGUMENTS

-nets {*collection_of_nets*}
Specifies the nets to be displayed. By default, all flip-chip nets are displayed. This option and **-nets_in_file** are mutually exclusive; you can specify only one.

-nets_in_file *nets_file*
Specifies the name of a file that contains the nets to be displayed. By default, all flip-chip nets are displayed. This option and **-nets** are mutually exclusive; you can specify only one.

-open_nets
Display the open net flylines of the specified nets and write the open nets to the file specified in **-output_open_nets**. By default, the open net flylines are not displayed.

-output_open_nets *open_net_file*
Specifies the name of the output file for the open net listing. This option is valid only when **-open_nets** is used. By default, the file is named **.trUnrouted**.

DESCRIPTION

This command displays the flylines of the specified flip-chip nets in the layout window of the IC Compiler GUI. This command requires that the GUI is active.

EXAMPLES

The following example displays all open flip-chip nets in the layout view of the IC Compiler GUI.

```
prompt> display_flip_chip_route_flylines -open_nets
prompt> display_flip_chip_route_flylines -open_nets \
-output_open_nets RDLOpen
```

SEE ALSO

```

create_stack_via_on_pad_pin(2)
write_flip_chip_nets(2)
push_flip_chip_route(2)
remove_flip_chip_route(2)
```

distance

Describes basic command types for describing mask geometry.

SYNTAX

None.

ARGUMENTS

None.

DESCRIPTION

This command describes basic types of distance for describing mask geometry.

A *distance* is a basic command syntax unit, like strings, and floating-point numbers. In ICC, a distance must be a fixed-point number. Thus 7, 142.65 and 100000.000 are all distances, but 3.7e6 is not.

Distances are returned by some commands, and some attributes are distances. Distances can be used as arguments to some commands.

Distances can be grouped into lists to form points. A *point* is a Tcl list of two distances, which are interpreted as the X and Y values of the coordinate. For example, the origin is {0 0}.

A *rectangle* is a Tcl list of two points, which are interpreted as the lower-left and upper-right corners. For example, the unit square is {{0 0} {1 1}}.

To access a distance when given a point, you might want to use the lindex function.

EXAMPLES

The following examples show how to set several uses of distance.

```
prompt> set spacing 12.25

prompt> set lower_left_x 2.5
prompt> set lower_left_y 44.125

prompt> set corner {22.54 1235.75}

prompt> set base [list $lower_left_x $lower_left_y]

prompt> set box [list $base [list 222.14 [expr 200.2 * 7]]]

prompt> get_attribute $cell1 bbox
prompt> {241.5 700.1} {246.4 703.1}
```

SEE ALSO

`move_object(2)`

distribute_objects

Distributes one or more objects.

SYNTAX

```
status distribute_objects
[-anchor object]
[-parent]
[-from value_point_rect]
[-to value_point_rect]
[-side {left | right | top | bottom | hcenter | vcenter}]
[-spread]
[-vertical]
[-offset real]
[-wiretrack_offset int]
[-resize]
[-keep_area]
[-ignore_fixed]
objects
```

Data Types

<i>object</i>	collection
<i>value_point_rect</i>	int, point, or rectangle
<i>objects</i>	collection

ARGUMENTS

-anchor *object*
Specifies the first object that other objects are distributed from.
The argument should consist of a collection of one object.

-parent
Specifies that objects are distributed starting at the parent edge.

-from *value_point_rect*
Specifies that objects are distributed starting at the specified position.
The position can be a single value (x for horizontal, y for vertical), a point, or a rectangle.

-to *value_point_rect*
Specifies that the objects are distributed between two positions. The first specified by the **-from** argument and the second specified by this argument.
The position can be a single value (x for horizontal, y for vertical), a point, or a rectangle.

-side {left | right | top | bottom | hcenter | vcenter}
Specifies the side of the anchor object that the objects are distributed from.
The default depends on the aspect ratio (height/width) of the objects' surrounding bbox. If the aspect ratio is less than or equal to 1 then left is the default otherwise bottom is the default.
left , 1 : Left Side

```

right , r      : Right Side
top   , t      : Top Side
bottom , b     : Bottom Side
hcenter, hc, ch : Horizontal Center
vcenter, vc, cv : Vertical Center
The default is left.
```

-spread
 Specifies that the specified objects should be spread between the leftmost and rightmost specified fixed objects. If no fixed objects are specified the leftmost and rightmost objects are used.

-vertical
 Specifies that the specified objects should be spread vertically rather than horizontally when using either the **-to** or **-from** options.

-offset real
 Specifies the spacing between each distributed object.
 This option is ignored if used together with **-wiretrack_offset** (see below) and all distributed objects are either pins or terminals.
 The default is **0.0**.

-wiretrack_offset int
 Specifies the spacing between each distributed object in terms of number of wire tracks. This option is valid only when the objects to be distributed are all pins or terminals. It is otherwise ignored.
 For example, **-wiretrack_offset 2** means that there should be two wiretracks between adjacent pins (or terminals).
 The default value is 1. This default value comes into effect if the objects to be distributed are all pins or terminals and inter-object distance is not otherwise specified or implied. For example, **distribute_objects -side top \$select_pins** results in pins in the collection "select_pins" getting placed on every other wiretrack. However, the default value is not applicable for **distribute_objects -spread \$select_pins** because option **-spread** implies that the pins are to be equally spaced between the first and the last pins.

-resize
 Whether to resize the object when distributing.

-keep_area
 Whether to keep the original object's area when resizing.

-ignore_fixed
 Normally fixed objects will not be distributed. If this flag is supplied then fixed objects will also be distributed.

objects
 List of objects to distribute.

DESCRIPTION

Distribute a list of unfixed objects so that they are placed side by side horizontally or vertically with an optional spacing between each object.

The user can specify an anchor object or anchor position, or let the command automatically determine the anchor object from the supplied list of objects using the following algorithm:

- If any objects are marked as fixed then the anchor objects is selected from the set of fixed objects. The rightmost, leftmost, bottommost or topmost fixed object for alignment of left, right, top and bottom respectively.
- If no objects are marked as fixed then the anchor object is taken as the leftmost, rightmost, topmost or bottommost object for alignment of left, right, top and bottom respectively.

The command essentially has two modes:

- &. Distribute - If 'to position' is not specified
- &. Spread - If 'to position' is specified then the objects

Distribute Mode

After each object is moved or resized to be next to the anchor object, the anchor object is updated to be the distributed object. The next object in the sequence is then selected to be the leftmost, rightmost, topmost or bottommost unfixed object for distribute left, right, top and bottom respectively.

When distributing an object the position of the opposite edge can be retained so that the object will be resized instead of moved. The position of the other sides of the object will also be retained unless the user specifies that the area is to be kept in which case the other sides are moved to achieve the original object area.

Spread Mode

The anchor object or anchor position and to position mark a range over which the objects are spread. The objects are then evenly spaced (moved) over this range or evenly resized to fill this range (with any specified offset between them).

The existing left->right or bottom->top order specifies the order in which the objects are placed.

When -resize is not specified any movable object can be aligned. If -resize is specified then only resizable objects can be aligned. See `get_edit_property(2)` man page for details on which objects can be moved and resized.

The spread direction is by default horizontal. Using the **-vertical** option changes it to vertical.

NOTES

Snapping is done automatically using global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example moves the currently selected objects so that they are placed side by side in the horizontal direction with 20 units between each.

```
> distribute_objects [get_selection] -parent -offset 20
```

The following example resizes the currently selected objects so that they are an even sized between 0 and 800.

```
> distribute_objects [get_selection] -from 0 -to 800 -resize -vertical
```

```

drive_of

Returns the drive resistance value of the specified library cell pin.

SYNTAX

```
float drive_of
library_cell_pin
[-rise | -fall]
[-piece best | worst | average average_value]
| [-min]
```

Data Types

library_cell_pin string

ARGUMENTS

library_cell_pin

Specifies the name of the library cell pin whose drive value is to be returned. Use the following format to specify this option: *library_name/lib_cell_name/pin_name*. The specified library must already be loaded into the shell.

-rise

Specifies that the command is to return the *library_cell_pin* rise drive resistance.

-fall

Specifies that the command is to return the *library_cell_pin* fall drive resistance.

-piece best | worst | average average_value

Specifies to return the **best**, **worst**, or *average_value* of all of the pieces. The *average_value* corresponds to the *average_value* integer index value. This option can be used only with piecewise-linear libraries.

-min

Gets the wire's drive value.

DESCRIPTION

This command returns the drive or wire_drive resistance of the specified library cell pin. The resistance is primarily used as an argument to the **set_drive** command. The **set_driving_cell** command provides a more convenient and accurate method of describing the drive capability of a port.

If you do not use either the **-rise** or **-fall** option, the command returns the largest of the rise or fall drive resistances.

If the command cannot find the specified *library_cell_pin*, it issues an error message and returns 0.0.

Because drive resistances are associated with timing arcs, it is possible to have more than one distinct rise and fall drive associated with a specified library pin. In this case, the command returns the largest resistance.

If the specified library uses the nonlinear (table-lookup) delay model, the command returns an estimated linear drive value. The **set_driving_cell** command handles nonlinear drives and produces more accurate results than the **set_drive** command for these libraries.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command returns the rise drive of the *my_pin* pin of the *lib_cell* cell from the *tech_lib* library.

```
prompt> drive_of -rise tech_lib/lib_cell/pin
```

The following command searches through all of the pieces of the **rise_pin_resistance** attribute on the *my_pin* pin of the *lib_cell* cell. The command returns the worst value for all of the pieces. This assumes that the *tech_lib* library is modeled as a piecewise-linear library; otherwise, the command returns the normal *rise_resistance*.

```
prompt> drive_of -piece "worst"\n-rise tech_lib/lib_cell/pin
```

SEE ALSO

```
set_drive(2)\nset_driving_cell(2)
```

echo

Echos arguments to standard output.

SYNTAX

```
string echo
[-n] [argument...]
```

ARGUMENTS

-n

By default, **echo** adds a newline. This option suppresses it.

DESCRIPTION

Prints out the value of the given arguments. Each of the arguments are separated by a space. The line is normally terminated with a newline, but if the **-n** option is specified, multiple **echo**s are printed onto the same output line.

The **echo** command is used to print out the value of variables and expressions in addition to text strings. The output from **echo** can be redirected using the **>** and **>>** operators.

EXAMPLES

```
prompt> echo "Running version" $sh_product_version
Running version v3.0a
```

```
prompt> echo -n "Printing to" [expr (3 - 2)] > foo
prompt> echo " line." >> foo
prompt> sh cat foo
Printing to 1 line.
```

SEE ALSO

eco_netlist

Performs engineering change order (ECO) operations on current Milkyway cell.

SYNTAX

```
status eco_netlist
[-by_verilog_file verilog_filename]
[-physical]
[-compare_pg]
[-freeze_silicon]
[-write_changes write_changes_file_name]
```

Data Types

verilog_filename string

ARGUMENTS

-by_verilog_file *verilog_filename*

Specifies the Verilog source file name for the ECO change.

-physical

Enables special handling of the physical-only cell instances and their existing connections.

When you use this option, if the Verilog netlist contains a physical-only cell instance and the working design does not, ECO adds it into the design. However, if the working design contains a physical-only cell instance that is not present in the Verilog netlist, ECO discards it from the design.

By default, ECO updates only the logical netlist objects according to the input golden Verilog file and ignores any differences in physical-only cell instances. If the Verilog netlist contains a physical-only cell instance and the working design does not, ECO does *not* add it into the design. However, if the working design contains a physical-only cell instance that is not presented in the Verilog netlist, the ECO keeps it in the design.

-compare_pg

Compares power and ground (PG) related nets and connections. When the option is enabled, the command updates PG data, such as signal data, in the working design according to the golden Verilog file. Thus, the following conditions occur:

- If the working design contains a PG network and the golden Verilog file does not, ECO removes the PG network from the working design.
- If the working design does not contain a PG network and the golden Verilog file does, ECO adds the new PG network to the working design.
- If both the working design and the golden Verilog file contain a PG network, ECO treats the Verilog PG network as golden and performs PG changes in the working design according to the Verilog PG network.

By default, ECO ignores the PG differences between the working design and the

golden Verilog file. No changes are made to the PG network in the working design.

-freeze_silicon

Turns on the ECO freeze silicon mode. In the freeze silicon mode, ECO behaves in the following way:

- When removing a cell instance, **eco_netlist** does not actually remove the cell from the design. The cell instance name stays the same as it was. The cell is marked as a spare cell.

The PG connections on PG pins are kept as they are, disregarding the - compare_pg option. All signal pins are disconnected. The input signal pins are tied to direct tie low net while the output signal pins are left floating.

- When adding a cell instance, **eco_netlist** checks if there is a spare cell with the same name in the design. If yes, ECO renames the spare cell, then continues to add the new cell.

The convention used for renaming cells is SPARE_OriginalCellName. If the name still conflicts with another cell, SPARE_OriginalCellName_# will be used, where # is a number starting from zero.

- When replacing or resizing a cell instance, ECO first removes the old cell, then adds the new cell. ECO behaves exactly the same when removing and adding cell instances.

Before implementing any changes, ECO first checks the feasibility of spare cells for all cell-adding operations. This is to make sure each of the newly added cells can be mapped to an available spare cell. One cell-adding operation is verified to be feasible only if an available spare cell is found. A spare cell is considered available if it is in all of the following conditions:

- The spare cell is of the same cell instance master.
- The spare cell is in the same voltage area as the cell to be added. Once ECO detects there are not enough available spare cells to use, it will output a warning messages.

-write_changes write_changes_file_name

Generates a Tcl script file that lists all the changes the **eco_netlist** command does.

With the Tcl-based netlist editing commands in the output Tcl file, you can repeat the changes on the original working cell and create a new cell. This new cell is exactly the same as the cell created by the **eco_netlist** command. The **eco_netlist** command supports generating Tcl scripts file under both unconstrained mode and freeze-silicon mode.

DESCRIPTION

Compares the current design netlist with the golden Verilog file, and then changes the current design based on the golden Verilog file. A cell must be open before using this command. The changed cell is not saved automatically. For a soft macro, the child cells are automatically opened, but are not automatically saved.

Adding and removing hierarchical cell instances are not allowed. This means the hierarchy of the Verilog must be exactly the same as it is in the Milkyway database.

For details about using this command in the IC Compiler ECO flow, see *IC Compiler User Guide: Implementation*, which is available on SolvNet.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the most common use of this command.

```
prompt> open_mw_cel working
prompt> eco_netlist -by_verilog_file golden.v \
-write_changes fileName.tcl

...
[ECO] ADD_CELL_INSTANCE 'c4_celi_add_SIG1' (AND2T FRAM) .
[ECO] ADD_PORT 'min1' (input) on cell instance 'c12_hiport_rm_SIG'
[ECO] ADD_NET 'min1' into 'c12_hiport_rm_SIG'
[ECO] CONNECT net 'min1' in cell instance 'c12_hiport_rm_SIG' with port 'min1'.
[ECO] CONNECT net 'min1' in cell instance 'c12_hiport_rm_SIG' with port instance 'c12_leaf_celi/A'.
[ECO] DISCONNECT net 'min1' in cell instance 'c10_hiport_rm_SIG' from port instance 'c10_leaf_celi/A'.
[ECO] DISCONNECT net 'min1' in cell instance 'c10_hiport_rm_SIG' from port 'min1'.
[ECO] REMOVE_NET 'min1' from 'c10_hiport_rm_SIG'
[ECO] REMOVE_PORT 'min1' on cell instance 'c10_hiport_rm_SIG'.
...
...
```

`route_eco(2)`

end_fp_trace_mode

Removes the trace mode design from memory.

SYNTAX

```
status end_fp_trace_mode
```

DESCRIPTION

This command removes the trace mode design from memory.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLE

The following example shows a basic output of the **end_fp_trace_mode** command.

```
prompt> get_fp_trace_mode
Design is in trace mode
0
prompt> end_fp_trace_mode
prompt> get_fp_trace_mode
Design is not in trace mode
1
```

SEE ALSO

```
get_fp_trace_mode(2)
set_fp_trace_mode(2)
```

error_info

Prints extended information on errors from last command.

SYNTAX

string **error_info**

DESCRIPTION

The **error_info** command is used to display information after an error has occurred. Tcl collects information showing the call stack of commands and procedures. When an error occurs, the **error_info** command can help you to focus on the exact line in a block which caused the error.

EXAMPLES

This example shows how **error_info** can be used to trace an error. The error is that the iterator variable "s" is not dereferenced in the 'if' statement. It should be '\$s == "a" '.

```
prompt> foreach s $my_list {?           if {s == "a"} {?           echo "Found 'a'!"  
?  
?  
Error: syntax error in expression " s == "a" "  
      Use error_info for more info. (CMD-013)  
prompt> error_info  
Extended error info:  
syntax error in expression " s == "a" "  
      while executing  
"if {s == a} {      echo "Found 'a'"  
}  
("foreach" body line 2)  
invoked from within  
"foreach s [list a b c] {    if {s == a} {      echo "Found 'a'"  
}  
}  
-- End Extended Error Info
```

SEE ALSO

estimate_fp_area

Performs automated die size exploration for finding the smallest die size possible to decrease the cost per die. Can also be applied to blocks.

SYNTAX

```
status estimate_fp_area
[-min_height min_height]
[-max_height max_height]
[-min_width min_width]
[-max_width max_width]
[-acceptable_overflow percentage]
[-sizing_type fixed_width | fixed_height | fixed_aspect_ratio]
[-core_sizing_only]
[-keep_blockages]
[-increase_area area]
[-replace_io]
[-maintain_iopad_alignment]
[-power_net_names list_of_names]
[-ir_drop_value target_value]
[-run_preroute_script preroute_script_name]
[-run_pns_script script_name]
[-save_as name]
[-maintain_power_structure]
[-estimate_optimization]
```

Data Types

<i>min_height</i>	float
<i>max_height</i>	float
<i>min_width</i>	float
<i>max_width</i>	float
<i>percentage</i>	float
<i>area</i>	float
<i>list_of_names</i>	list
<i>target_value</i>	float
<i>preroute_script_name</i>	string
<i>name</i>	string

ARGUMENTS

-min_height *min_height*

Specifies the lower bound of core height, in microns, required to stop this command. By default, no die sizes that result in utilizations greater than 95% are considered.

-max_height *max_height*

Specifies the upper bound of core height, in microns, required to stop this command. By default, no die sizes that result in utilizations lower than 30% are considered.

-min_width *min_width*
 Specifies the lower bound of core width, in microns, required to stop this command. By default, no die sizes that result in utilizations greater than 95% are considered.

-max_width *max_width*
 Specifies the upper bound of core width, in microns, required to stop this command. By default, no die sizes that result in utilizations lower than 30% are considered.

-acceptable_overflow *percentage*
 Specifies the overall gcell overflow percentage in the range of (0.0 - 0.25) to determine whether a design is routable. By default, the tool determines routability by analyzing neighborhoods of individual gcells.

-sizing_type *fixed_width | fixed_height | fixed_aspect_ratio*
 Defines constraints on the search space of aspect ratios. By default, the tool allows the aspect ratio to vary.

-core_sizing_only
 Allows core shrink only. That is, it leaves the I/O pad ring untouched, as in the input floorplan. By default, the block or chip shrinks with the core and the I/O pad or pin placement is scaled.

-keep_blockages
 Keeps placement blockages in the input floorplan undeleted. By default, the tool deletes all blockages in the input design.

-increase_area *area*
 Provides the ability to reserve some extra space for cells to be added later in the flow. The area is specified in square microns. The default value is 0 (zero).

-replace_io
 Replaces all I/O pads and pins based on Top Design Format (TDF) constraints. If no TDF file exists, a TDF file is created with side and order constraints. By default, the command maintains the relative I/O placement of the input floorplan.

-maintain_iopad_alignment
 Aligns the I/O pads in different rings when multi-ring I/O structures are present. By default, the command separately scales each I/O ring.

-power_net_names *list_of_names*
 Invokes power network synthesis during die size exploration. The *pair_of_names* value can be a list of strings. Power and ground net names must be provided as a list of net names. By default, the command does not run power network synthesis.

-ir_drop_value *target_value*
 Specifies the target IR drop value. The default is 10% of VDD value, in mV, for power network synthesis.

-run_preroute_script *preroute_script_name*
 Pre-routes certain nets after power network synthesis (PNS) by using a script

file. By default, the command does not create pre-routes.

-run_pns_script *script_name*
Runs PNS by using an input script instead of the default PNS run. By default, the command does not do PNS unless you use either the **-run_pns_script** or **-power_nets** option.

-save_as *name*
Specifies a cell name in which to save the die size exploration result. By default, it is "DesignName"EstimateArea.

-maintain_power_structure
Maintains the power structure.

-estimate_optimization
Estimate the amount of area required by optimization and account for this during the search for the minimal die size. This option is recommended if the input netlist is not optimized.

DESCRIPTION

This command automates die size exploration. It explores the solution space of valid die areas to determine the smallest, routable die size. The command maintains relative placement of important elements in the floorplan. When applied to full chips, it maintains the relative placement of hard macros and the side, order, and relative placement of I/O pads. When applied to rectangular or rectilinear blocks, it maintains the relative placement of hard macros and the side, order, layer, and relative placement of pins. The relative locations of plan groups and voltage areas are maintained, and the plan groups and voltage areas are sized in proportion to the core area for both blocks and chips.

Multicorner-Multimode Support

Depending on the options used, this command either uses the active scenarios or has no dependency on scenario-specific information.

EXAMPLE

The following example performs die size exploration with all defaults.

```
prompt> estimate_fp_area
```

The following example performs PNS and PG grids generation in the **estimate_fp_area** process.

```
prompt> estimate_fp_area -power_net_names {VDD VSS}
```

The following example changes the die size only in the y-dimension.

```
prompt> estimate_fp_area -sizing_type fixed_width
```

SEE ALSO

estimate_fp_black_boxes

Sets the size of a black box based on an estimation of the objects that it will contain when replaced with real logic.

SYNTAX

```
status estimate_fp_black_boxes
[[{-sm_size size
  | -polygon {polygon_area}]
  | -sm_gate_equiv gate_count}]
[-sm_util util]
[-hard_macros names]
[-fixed_shape]
[-reset_shape]
black_boxes
```

Data Types

<i>size</i>	list
<i>polygon_area</i>	list
<i>gate_count</i>	integer
<i>util</i>	float
<i>names</i>	string
<i>black_boxes</i>	collection

ARGUMENTS

-sm_size *size*

Estimates the area as a soft macro of the specified size. The estimated area is determined by multiplying width by height, given by a list of 2 floating point numbers. If you also use the **-sm_util** option, an equivalent gate count value is calculated internally based on the *util* value. Otherwise, the tool uses a value of 1.0 for utilization when *sm_size* is used, but *sm_util* is not used. The **-sm_size** and **-polygon** options are mutually exclusive: you can use only one. By default, this option is off.

-polygon {*polygon_area*}

Creates a rectilinear black box. Substitute a list of defining points of the polygon you want for *polygon_area*. A polygon is identified by specifying the coordinates of all its points. The format is {{x1 y1} {x2 y2} ... {x1,y1}}. Identify the points as absolute coordinates in microns. The **-sm_size** and **-polygon** options are mutually exclusive: you can use only one. When you use the **-polygon** option to estimate black box size, the **sm_util** variable defaults to 1.0. By default, this option is off.

-sm_gate_equiv *gate_count*

Estimates the area as a soft macro with the specified number of equivalent gates. If you also use the **-sm_util** option, an equivalent gate count value is calculated internally based on the *util* value. Otherwise, the tool uses a value of 0.7 and a standard gate area of 2-input-nand gate to estimate the total area.

```

-sm_util util
    Estimates the area as a soft macro of the specified utilization. To use this
    option, you must also use the -sm_gate_equiv option specifying a positive
    value for gate_count. The default value is 0.7 (except for when you also use
    the -sm_size or -polygon options.

-hard_macros names
    Specifies a list of reference library hard macro names in a string with the
    names separated by spaces or commas. Each name can have an optional instance
    count. The instance count is specified as a number in parentheses () appended
    to the name. For example, 10 instances of the mem macro is specified as
    mem(10).

    The size estimation includes the area of all the hard macros in the specified
    list. This estimation mode does not consider the shapes of the actual hard
    macros.

-fixed_shape
    Specifies whether to mark the black box as fixed shape after estimation.

-reset_shape
    Specifies whether to reset the shape to rectangular if it is currently
    rectilinear.

black_boxes
    Specifies the black boxes to estimate.

```

DESCRIPTION

This command allows you to set the size of a black box from the estimation of the objects that it will contain when finally replaced with real logic.

The estimation can be as a soft or hard macro. As a soft macro it has one, but not both, of the following characteristics:

- a size, specified by using the **-sm_size** or **-polygon** option
- the number of gate-equivalent cells with utilization, specified by using the **-sm_gate_equiv** option.

You can specify utilization in any of the 3 cases: **-sm_size**, **-polygon**, or **-sm_gate_equiv**. As a Hard Macro it has either a specified size (**-sm_size**) or number of gate equivalent cells (**-sm_gate_equiv**).

If you do not use the **-hard_macros** option, then you must use the **-sm_size**, **-polygon**, or **-sm_gate_equiv** option. If you specify both **-sm_size** and **-sm_gate_equiv** together, then the *size* value takes precedence and the *gate_count* value is ignored; and, instead, becomes a dependent variable that is calculated based upon the *size* value. Similarly, you specify both the **-polygon** and **-sm_gate_equiv** options together, then the *polygon_area* value takes precedence and the *gate_count* value is ignored; and, instead, becomes a dependent variable that is calculated based upon the *polygon_area* value.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example estimates a black box named alu1 to a soft macro size of 100x100 with a utilization of 0.7.

```
prompt> estimate_fp_black_boxes\  
-sm_size {100 100} -sm_util 0.7\  
[get_cells -filter "is_physical_black_box==true" alu1]
```

The following example estimates a black box named alu1 to a rectilinear soft macro.

```
prompt> estimate_fp_black_boxes\  
-polygon {{1723.645 1925.365} {1723.645 1722.415}\  
{1803.595 1722.415} {1803.595 1530.535}\  
{799.915 1530.535} {799.915 1925.365}\  
{1723.645 1925.365}}\  
[get_cells -filter "is_physical_black_box==true"\  
I_ORCA_TOP/I_PCI_TOP]\  
[get_cells -filter "is_physical_black_box==true" alu1]
```

SEE ALSO

```
get_cells(2)  
import_fp_black_boxes(2)
```

estimate_rc

Estimates RC coefficients based on annotated data.

SYNTAX

```
status estimate_rc
[-bound max_float_capacitance]
[-min]
[-net net_list]
[-nworst_nets percentage]
[-threshold min_float_capacitance]
```

Data Types

<i>max_float_capacitance</i>	float
<i>net_list</i>	list
<i>percentage</i>	integer
<i>min_float_capacitance</i>	float

ARGUMENTS

-bound *max_float_capacitance*
Specifies the maximum back-annotated capacitance below which nets are to be considered for estimation.

-min
Specifies to use the minimum conditions. By default, the command uses maximum conditions.

-net *net_list*
Estimates only for those nets on *net_list*. If you also specify either the **-threshold** or **bound** option, only those nets that meet the criteria in the current instance are used. When you use both the **-net** and **-nworst_nets** options, the command ignores the **-nworst_nets** option.

-nworst_nets *percentage*
Specifies the percentage of nets, based on timing criticality, to select for estimation of RC coefficients. If it is specified out of range (0 to 100), all nets that meet the threshold and bound criteria in the current instance are used. The default is 100 percent. When you use both the **-net** and **-nworst_nets** options, the command ignores the **-nworst_nets** option.

-threshold *min_float_capacitance*
Specifies the minimum back-annotated capacitance above which nets are to be considered for the estimation.

DESCRIPTION

This command uses back-annotated data for net loads and pin-to-pin delays and computes a set of RC coefficients that would best fit the provided data. These coefficients, if used to compute the net loads and pin-to-pin delays, minimize the

error between the annotated and computed values.

The Standard Delay Format (SDF) files and **set_load** files must be sourced before running this command. The command prints out the suggested values for RC coefficients on the standard output. If you use these values, use the **set_delay_estimation_options** command to set them before performing optimization.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example runs the **estimate_rc** command.

```
prompt> estimate_rc -nworst_nets 10
Loading design 'test_design'
Capacitance - horizontal 0.0001696 vertical : 5.845e-06
Resistance - horizontal 1.692e-07 vertical : 9.987e-08
```

SEE ALSO

```
read_sdf(2)
report_delay_estimation_options(2)
set_delay_estimation_options(2)
set_load(2)
```

exit

Terminates the application.

SYNTAX

```
string exit
[exit_code]
```

Data Types

exit_code int

ARGUMENTS

exit_code
Return code to the operating system. Default is 0.

DESCRIPTION

This command exits from the application. You have the option to specify a code to return to the operating system.

EXAMPLES

The following example exits the current session and returns the code 5 to the operating system. At a UNIX operating system prompt, verify the return code as shown.

```
prompt> exit 5
```

5

SEE ALSO

[quit\(2\)](#)

expand_flip_chip_cell_locations

Pushes flip-chip bump or driver cells away proportionally or pulls them closer according to a specified ratio.

SYNTAX

```
status expand_flip_chip_cell_locations
-flip_chip_cells cell_list
-expand_ratio ratio
```

Data Types

<i>cell_list</i>	collection
<i>ratio</i>	float

ARGUMENTS

-**flip_chip_cells** *cell_list*

Specifies the flip chip bump or driver cells to push or pull. You must specify at least two cells because this command changes their relative positions.

-**expand_ratio** *ratio*

Specifies a ratio by which the selected flip chip bump or driver cells are to be expanded. If the given ratio is less than 1.0, cells are pulled closer. The ratio should be somewhere between 0.01 and 100.

DESCRIPTION

This command proportionally expands or shrinks the relative locations of given flip chip bump or driver cells. You must specify at least two cells so that the relative locations can be expanded or shrunk.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example expands the locations of the flip chip bumps by a factor of 1.2.

```
prompt> expand_flip_chip_cell_locations\
-flip_chip_cells\
{BUMP_ring_D1 BUMP_ring_D2 BUMP_ring_D3 \
BUMP_ring_D4 BUMP_ring_D5 BUMP_ring_D6} \
<bold-expand_ratio 1.2
```

SEE ALSO

`place_flip_chip_array(2)`
`place_flip_chip_ring(2)`

expand_objects

Expands one or more objects by moving each side out until it hits another object or the core boundary (number of sides retained) or make object fill available space around it (number of sides is not retained)

SYNTAX

```
status expand_objects
[-side {left | right | top | bottom | all}]
[-fill]
[-offset real]
[-hit_types string_list]
[-ignore_fixed]
objects
```

ARGUMENTS

```
-side {left | right | top | bottom | all}
      Specifies the side(s) of the object that are expanded:
      left    Left Side
      right   Right Side
      top     Top Side
      bottom  Bottom Side
      all     All Sides
Note: if the user wishes to expand more than one side but not all sides then
multiple calls are required.
The default is all.
```

```
-fill
      Specifies that instead of moving each side outwards until it hits one of the
      specified object types (no fill) the shape is expanded to fill the space
      available around it which may result in new sides being created.
```

```
-offset real
      Specifies the spacing between the side(s) and the surrounding objects.
Note: this value can be negative as well as positive
The default is 0.0.
```

```
-hit_types string_list
      The types of objects considered for collisions.
      Valid types are:
      macro      Hard Macro or Soft Macro
      soft_macro Soft Macro
      hard_macro Hard Macro
      movebound  Move Bound
      plan_group Plan Group
      blockage   Blockage
      polygon    Polygon
      (Default: macro, plan_group, blockage and polygon)
```

```
-ignore_fixed
      Normally fixed objects will not be expanded. If this flag is supplied then
```

```
fixed objects will also be expanded.  
objects  
List of objects to expand
```

DESCRIPTION

Expands an object's sides until they hit another object or the core boundary.

The expansion is done either by moving each specified object side outwards until it hits one the specified object types (no fill) or the object fills the available space (fill) and new sides are created to match the shape of the available space.

If an offset is specified then the resultant shape's selected sides are shrunk (or grown in the case of negative offsets) by this offset after expansion.

Only resizable objects can be expanded. In the case where fill is used and the resultant shape is rectilinear only objects supporting rectilinear boundaries will be affected.

See `get_edit_property(2)` man page for a list of objects which can be resized or support rectilinear boundary.

NOTES

Specified objects must be completely inside the core area.

If the operation results in an invalid object boundary (self overlapping) the command will fail

Snapping is done automatically using global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example resizes the alu1 cell so that it's bounding box is 20 units from any of the collision objects in all directions.

```
> expand_objects alu1 -side all -offset 10
```

explore_power_switch

Explores and estimates the placement of MTCMOS header or footer cells based on IR drop.

SYNTAX

```
status explore_power_switch
-lib_cells lib_cells_or_power_switches
-real_pg_net real_pg_net_name
-virtual_pg_net virtual_pg_net_name
[-header]
[-bounding_box bounding_box]
[-x_increment {x_inc_list}]
[-y_increment {y_inc_list}]
[-orientation {N | W | S | E | FN | FE | FS | FW}]
[-voltage_area voltage_area]
[-no_placement]
[-legalize_placement]
[-no_pns]
[-run_pns_script file_name]
[-design hierarchy_name]
[-save_placement prefix]
[-preroute_mode_real_pg_port {rail | tie | net}]
[-no_preroute_real_pg_port]
[-preroute_mode_virtual_pg_port {rail | tie | net}]
[-no_preroute_virtual_pg_port]
```

Data Types

<i>lib_cells_or_power_switches</i>	collection
<i>real_pg_net_name</i>	collection
<i>virtual_pg_net_name</i>	collection
<i>bounding_box</i>	rectangle
<i>x_inc_list</i>	list
<i>y_inc_list</i>	list
<i>voltage_area</i>	collection
<i>file_name</i>	string
<i>hierarchy_name</i>	string
<i>prefix</i>	string

ARGUMENTS

-lib_cells *lib_cells_or_power_switches*
Specifies the header or footer multithreshold CMOS (MTCMOS) cells to be used for exploration. Use power switches for Unified Power Format (UPF) mode, and use lib cells for non-UPF mode. The *lib_cells_or_power_switches* argument can be a collection or list.

-real_pg_net *real_pg_net_name*
Specifies a real power or ground net on which to perform power network analysis. Real power nets connect to the real power pins of the MTCMOS cells. The real power net is not powered down. The *real_pg_net_name* argument can be

a collection or list of one item.

Under UPF mode, this option is optional. The default is to get the input supply net connectivity from the input port of the power switches.

-virtual_pg_net virtual_pg_net_name

Specifies a virtual power or ground net on which to perform IR drop analysis. Virtual power nets connect to the virtual power pins of the MTCMOS cells. The virtual power net can be powered down by the MTCMOS header or footer cells to reduce leakage power. The *virtual_pg_net_name* argument can be a collection or list of one item.

Under UPF mode, this option is optional. The default is to get the output supply net connectivity from the output port of the power switches.

-header

Places and analyzes header cells (typically PMOS transistors) that connect to power nets. The command cannot insert header and footer cells simultaneously. For header cells, specify the power (VDD) nets to be analyzed. For footer cells, specify the ground nets to be analyzed.

By default, the tool analyzes the footer cells (typically NMOS transistors) that connect to ground nets. Under UPF mode, the default is to get the power and ground type from the supply net of power switches; getting the header for power and footer for ground.

-bounding_box bounding_box

Defines the bounding box (in microns) of the area in which to place the header or footer cells.

If you specify both the **-voltage_area** and **-bounding_box** options, header/footer cells are added to the intersecting region of the given bounding box and voltage area. If you do not use the **-voltage_area** option, the specified bounding box coordinates are relative to the origin of the design.

If you use the **-bounding_box** option and also use the **set_mtcmos_pna_strategy** command with its **-relative_to_voltage_area** option, the specified bounding box coordinates are relative to the lower-left corner of the voltage area's bounding box. The default *bounding_box* is the core area.

-x_increment {x_inc_list}

Specifies a distance as a list of x-increments in microns. The values in the list are used as x-direction spacings between two header or footer cells during placement exploration. By default, the command inserts two header or footer cells, one at each end of a standard cell row.

-y_increment {y_inc_list}

Specifies a distance as a list of y-increments in microns. The values in the list are used as y-direction spacings between two header or footer cells during placement exploration. By default the command determines the y-increment from the height of the MTCMOS cell.

-orientation {N | W | S | E | FN | FE | FS | FW}

Specifies the orientation of header or footer cell placement. The valid values are **N**, **W**, **S**, **E**, **FN**, **FE**, , and **FW**. The default orientation is **N**.

-voltage_area voltage_area

Specifies a collection that contains only one voltage area. The header or footer cells are placed in the specified voltage area. By default, the top level is assumed.

-no_placement
Assumes that the current design is already properly placed. This skips the initial placement step and proceeds to do MTCMOS header or footer exploration and IR drop analysis. By default, the tool assumes that cells are not properly placed and performs a quick standard cell and macro placement.

-legalize_placement
Calls the **legalize_fp_placement** command after inserting a header or footer.

-no_pns
Skips all internal power network analysis (PNS) steps, but runs a user-specified PNS script.

-run_pns_script file_name
Runs a user-specified PNS TCL script instead of running an internal PNS step while exploring. The default is null.

-design hierarchy_name
Specifies the hierarchy name under which the header or footer is inserted.

-save_placement prefix
Saves each placement generated during explorations. The name of the saved design is derived from the name of the library cells, x-increment values, y-increment values, and the specified prefix. The default prefix is EHF_, so the default names of the saved design will be EHF_libCellName_yincrement_xincrement_designName. The number of saved designs depends on the number of placements explored. The saved placement might contain overlapping cells.

-preroute_mode_real_pg_port {rail | tie | net}
Specifies the mode of preroute when it is a preroute for the real power and ground port of a header or footer. The default mode is **net**.

-no_preroute_real_pg_port
Skips to preroute the real power and ground port of a header or footer.

-preroute_mode_virtual_pg_port {rail | tie | net}
Specifies the mode of preroute when it is the preroute for the virtual power and ground port of a header or footer. The default mode is **rail**.

-no_preroute_virtual_pg_port
Skips to preroute the virtual power and ground port of a header or footer.

DESCRIPTION

This command explores many placements of multithreshold XMOS (MTCMOS) header or footer cells with different x-spacings and y-spacings. Header and footer cells typically contain low leakage P/N transistors to reduce leakage current during power-down mode.

This command specifies a list of header or footer library reference cells and a two-dimensional grid for the header or footer cell placement. It runs fast placement of existing standard cells and macros and attempts all possible combinations of header or footer cells and spacings.

For each placement of header or footer cells, it estimates the IR drop using the power network analysis (PNA) engine and reports the results. Based on the results of the command, you can select the appropriate header or footer cells and their placement pitch to achieve the desired IR drop of the design.

Use this command to explore the placement of MT莫斯 header or footer cells in the power network at an early floorplanning stage. It assumes that the metal preroutes of the power network do not exist. If the power straps of the design are already constructed, use the **create_power_switch_array** command to insert MT莫斯 header and footer cells based on the existing power straps. By default, the **explore_power_switch** command does not modify the current design. Use the **-save_placement** option if you want to keep an explored placement.

Prerequisites

Before executing this command, you must perform the following tasks, in order, that are necessary for the Power Network Analysis (PNA) engine to compute the IR drop.

1. Define the power-on resistance of the header or footer cell by using the **set_attribute** command to set the **mtcmos_resistance** attribute.
2. Specify the metal layer for the power pins by using the **set_attribute** command to set the **mtcmos_pin_layers** attribute.
3. Define the power pad or virtual power pad by using the **create_fp_virtual_pad** command.
4. Verify that the virtual and real power and ground nets of all standard cells have been properly connected logically in the netlist. Use the **derive_pg_connection** command, if necessary. A standard cell to be powered down should connect to a virtual power or ground net. A standard cell that always stays on should be connected to a real power or ground net.
5. Use **set_mtcmos_pna_strategy** to define PNA, PNS, insert header-related and footer-related options.

EXAMPLES

The following example explores three placements of footer cells FOOTER_8, FOOTER_16, and FOOTER_32 at {20um, 50um, 100um} spacing in voltage area VA_1. The ground nets to be analyzed are VIRTUAL_VSS and VSS. IR drop analysis of each placement is reported.

```
prompt> explore_power_switch \
-lib_cells {"FOOTER_8" "FOOTER_16D" "FOOTER_32D"} \
-x_increment {20 50 100} -voltage_area VA_1 \
-virtual_pg_net VIRTUAL_VSS -real_pg_net VSS
```

The following example shows the use of the command under UPF mode, using power switches PS_A, PS_B, and PS_C.

```
prompt> explore_power_switch \
-lib_cells {"PS_A" "PS_B" "PS_C"} \
-x_increment {20 50 100} -voltage_area VA_1 \
-virtual_pg_net VIRTUAL_VSS -real_pg_net VSS

[-m15_pin_text_layers list_of_layers]
[-pin_must_connect_area_layer_number {layer number_name ...}]
[-auto_pin_must_connect_area_threshold collection_of_layer_values]
[-skip_rotated_via_region]
[-contact_selections collection_of_contactCode_numbers]
```

Data Types

<i>library_name</i>	string
<i>cell_name</i>	string
<i>collection_of_sides</i>	collection
<i>collection_of_cell_types</i>	collection
<i>collection_of_layers</i>	collection
<i>list_of_layers</i>	list
<i>collection_of_layer_values</i>	collection
<i>collection_of_contactCode_numbers</i>	collection

ARGUMENTS

```
-library_name library_name
    Specifies the library name.
```

-cell_name *cell_name*
 Specifies the cell name to create macro FRAM view.

-generate_boundary *collection_of_sides*
 Specifies the sides of the boundary to generate. By default, this command does not modify the cell boundary except that no cell boundary is in the CEL view or any side is specified.

-cell_types *collection_of_cell_types*
 Specifies the cell types to extract. By default, any cell of type standard, macro, or pad will be extracted in the library. If any types are specified, this command extracts only cells of the corresponding types.

-preserve_all_metal_blockage
 Preserves all metal blockage layers to metal layers in the FRAM view. The default is false for the GDS_IN flow. If you are using the LEF_in standard cell flow, you should set this variable to true.

-routing_blockage_output_layer *metBlk | rGuide | zeroG*
 Specifies the routing blockage output layer.
 Where metBlk means metal_blockage;
 rGuide means route_guide;
 zeroG means zero_min_spacing_route_guide.
 The default is metBlk.

-treat_all_blockage_as_thin_wire
 Treats all blockage as thin wire. The default is false. That is, all blockages are treated as-is.)

-treat_metal_blockage_as_thin *collection_of_layers*
 Specifies the metal layers to treat metal blockages as thin. By default, the fat-degree of metal blockage will be treated as it is.

-extract_pin_connectivity_through *collection_of_layers*
 Specifies the cut layers to extract pin connectivity. By default, the tool does not traverse connectivity through vias when identifying a pin. If the pin texts are on the same layers as the pin geometry, you do not need to specify the **-*_pin_text_layers** options. If pin texts are on a different layer than the pin geometry, you must specify the **-*_pin_text_layers** option for each of the corresponding masks.

-poly_pin_text_layers *list_of_layers*
 Specifies the text layers for poly pins.

-m1_pin_text_layers *list_of_layers*
 Specifies the text layers for m1 pins.

-pin_must_connect_area_layer_number {*layer number_name ...*}
 Specifies the layers of pin-must-connect-area for metal layers. By default, there is no pin-must-connect-area for each pin. To force the router to connect a pin at a particular location, specify the area geometry on a spare layer; where *number_name* means the layer number (or layer name or layer datatype name) of the geometry layer.

```
-auto_pin_must_connect_area_threshold collection_of_layer_values
    Specifies the auto pin-must-connect-area thresholds of metal layers. By
    default, the first-dimension fat contact threshold will be used to calculate
    the pin-must-connect-area for a fat pin; so that the router will drop a (fat)
    contact completely inside a fat pin.

-skip_rotated_via_region
    Skips rotated via regions. By default, this option is false (the via region
    is calculated for any default via).

-contact_selections collection_of_contactCode_numbers
    Specifies the contact code number of additional vias for which to extract the
    via region. By default, the via region is calculated only for default vias.
```

DESCRIPTION

Extract the blockage, pin, and via information for standard, macro, and pad library cells and store the result in the FRAM view. This information is used for placement and routing commands.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> extract_blockage_pin_via -library_name arc_rams_LM \
-cell_name evita \
-identify_macro_pin_by_pin_text \
-m3_pin_text_layers 33
```

SEE ALSO

create_macro_fram(2)

extract_flcc_hotspot

Performs lithography hot spot extraction (model-based). FLCC stands for Fast Lithography Compliance Check.

SYNTAX

```
extract_flcc_hotspot
[-cell_name
```

Data Types

cName string

ARGUMENTS

-cell_name *cName*

Specifies the cell name in which the extracted flcc hotspots will be stored. It is an Milkway CEL view cell, and is used exclusively to store flcc hotspot info, similar to drc error cell. User can use ICC error browser to open it and the flcc hotspots will be classified according to its categories. If this param is not specified, the flcc hotspot info will be stored in original top cell. If user opens the top cell with error browser, user still can view these flcc hotspots, but no category classification is supported.

DESCRIPTION

The command flcc_extract_hotspot requires two files to execute, viewHotSpots.ev and viewHotSpots.util. User should have these two files in the working directory before running this command.

If flcc errors are not stored in original top cell, it will facilitate the user to browse and compare the flcc errors before and after fixing. The param -cell_name is used to store flcc errors. The error cell is a Milkyway CEL view cell, and only contains error types, error objects and related descriptions.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command performs extract_flcc_hotspot:

```
prompt> extract_flcc_hotspot -cell_name B
```

```

extract_fp_rail_to_constraints

Extracts existing power network structure to a file with a set of power network synthesis constraints. The file can be used to recreate a power network rgat is the same as the existing one.

SYNTAX

```
status extract_fp_rail_to_constraints
[-power_net power_net_name]
[-output_file output_file_name]
[-ground_net ground_net_name]
[-rail_type type]
[-ignore_layers layer_names]
[-preroute_script script_file_name]
```

Data Types

<i>power_net_name</i>	string
<i>output_file_name</i>	string
<i>ground_net_name</i>	string
<i>type</i>	string
<i>layer_names</i>	string
<i>script_file_name</i>	string

ARGUMENTS

-power_net *power_net_name*
Specifies the name of the power net to be extracted.

-output_file *output_file_name*
Specifies the name of the output file.

-ground_net *ground_net_name*
Specifies the name of the ground net to be extracted.

-rail_type *type*
Specifies the rail type of the existing power network. The valid values are **number** or **pitch**. Use **number** to create constraints with a fixed number of straps. Use **pitch** to create constraints with a fixed pitch. The default is **number**.

-ignore_layers *layer_names*
Specifies the names of the layers to be ignored during the extraction process. By default, the command does not ignore any layers.

-preroute_script *script_file_name*
Specifies the name of a preroute constraints file with preroute Tcl commands, such as the **set_preroute_advanced_via_rule** command, and options.

DESCRIPTION

This command analyzes the existing power network with its core ring, block rings, and straps, and then creates a file with power network synthesis (PNS) constraints that is used to recreate the original power network. In the constraints, the width for each PG type, such as core ring, block rings, and straps for each layer is fixed. The widths in the constraints are obtained from the average widths of each PG type of the original PG structure.

There are two types of strap creations in the file: fixed straps number and fixed straps pitch. Fixed straps number keeps the same number of straps while design size is changed; and fixed straps pitch maintains the same pitch.

You can use the **-preroute_script** option to add customized preroute constraints, such as **set_preroute_advanced_via_rule** constraints, to fulfill a special requirement, such as advanced via rule. Apply the command before executing the **estimate_fp_area** command for MinChip. After that, you can run the **estimate_fp_rail -run_pns_script** command, specifying the preroute constraints file, to honor the PG structure during minimum die size exploration. The following example shows a created power network synthesis (PNS) constraints file.

```
# skip IR drop simulation
set_fp_rail_strategy -pns_skip_ir true

# layer constraints with the same pitch
set_fp_rail_constraints -add_layer -layer m5 -direction horizontal -
max_pitch 47.460 -min_pitch 47.460 -max_width 6.870 -min_width 6.870 -
spacing minimum
set_fp_rail_constraints -add_layer -layer m6 -direction vertical -max_pitch 47.460 -
min_pitch 47.460 -max_width 6.890 -min_width 6.890 -spacing minimum

# core ring constraints
set_fp_rail_constraints -set_ring -nets {VDD VSS} -horizontal_ring_layer {m5} -
vertical_ring_layer {m6} -ring_width 9.500 -extend_strap core_ring

# block ring constraints
set_fp_block_ring_constraints -add -horizontal_layer m5 -horizontal_width 4.000 -
vertical_layer m6 -vertical_width 4.000 -block_type instance -block {tarang1/
i_RAM} -nets {VDD VSS}
set_fp_block_ring_constraints -add -horizontal_layer m5 -horizontal_width 4.000 -
vertical_layer m6 -vertical_width 4.000 -block_type instance -block {tarang2/
i_RAM} -nets {VDD VSS}
set_fp_block_ring_constraints -add -horizontal_layer m5 -horizontal_width 4.000 -
vertical_layer m6 -vertical_width 4.000 -block_type instance -block {tarang3/
i_RAM} -nets {VDD VSS}
set_fp_block_ring_constraints -add -horizontal_layer m5 -horizontal_width 4.000 -
vertical_layer m6 -vertical_width 4.000 -block_type instance -block {tarang4/
i_RAM} -nets {VDD VSS}

# synthesize and then commit
synthesize_fp_rail -nets {VDD VSS}
commit_fp_rail
```

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example extracts a PG with power net named VDD and a ground net named VSS. It then creates a power network constraints file named PG.tcl that has the same pitch. ,sp

```
prompt> extract_fp_rail_to_constraints\
-power_net VDD -ground_net VSS\
-output_file PG.tcl -type pitch
```

The following example extracts a PG with power net named VDD and a ground net named VSS. It then creates a power network constraints file named PG.tcl that has the same straps number, ignoring a layer named M2, and specifying a file that has preroute constraints named preroute.tcl.

```
prompt> extract_fp_rail_to_constraints\
-power_net VDD -ground_net VSS -output_file PG.tcl\
-ignore_layers {M2} -preroute_script preroute.tcl
```

SEE ALSO

```

```

extract_fp_relative_location

Extracts relative location constraints from the current placement.

SYNTAX

```
status extract_fp_relative_location
[-target_cells cells]
[-target_corner bl | br | tl | tr]
[-anchor_object object_name]
[-anchor_corner bl | br | tl | tr]
[-output_file file_name]
```

Data Types

<i>cells</i>	collection
<i>object_name</i>	string
<i>file_name</i>	string

ARGUMENTS

-target_cells *cells*

Specifies the macro cells whose locations are to be extracted in the format of relative location constraints. The default is to extract all macro cells.

-target_corner *bl* | *br* | *tl* | *tr*

Specifies the corner of the target cell to be used to extract the constraints. The valid values and their descriptions are the following:

bl is the bottom-left corner.

br is the bottom-right corner.

tl is the top-left corner.

tr is the top-right corner.

The default is **bl**.

-anchor_object *object_name*

Specifies the name of the anchor object.

An anchor object can be a plan group, fixed macro cell, or core area.

The default is the name of a core area.

-anchor_corner *bl* | *br* | *tl* | *tr*

Specifies the corner of the anchor object's bounding box to be used in extracting constraints.

The valid values and their descriptions are the following:

bl is the bottom-left corner.

br is the bottom-right corner.

t1 is the top-left corner.

tr is the top-right corner.
The default is **bl**.

-output_file file_name

Specifies the name of the file to which to dump the extracted constraints.
The default is the name of the output to xterm and the tool's gui log window.

DESCRIPTION

This command extracts the location constraints of macro cells relative to an anchor object from the current placement. The output constraints from this command can be loaded back to the tool to restore the macro's current placement or to restrict design planning macro placement to respect these constraints.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example extracts the location constraints for all macro cells' top-right corner with respect to the bottom-right corner of the core area bounding box.

```
prompt>extract_fp_relative_location\
-target_corner "tr" -anchor_corner "bl"
```

SEE ALSO

```
remove_fp_relative_location(2)
set_fp_relative_location(2)
```

extract_hier_antenna_property

Extracts the hierarchical antenna properties of all the top-level ports in the given cell.

SYNTAX

```
integer extract_hier_antenna_property
[-cell_name cell_name]
```

Data Types

cell_name string

ARGUMENTS

```
-cell_name cell_name
          Cell instance name in the design from which to extract antenna properties.
          This option is required.
```

DESCRIPTION

This command extracts the hierarchical antenna properties of all the top-level ports in the given cell routed by Astro or IC Compiler. The hierarchical antenna properties include gate size, routing area, and diode protection for all the ports of the macros. These properties can be used by the tool for checking antenna rules on the nets connected to the macro pins.

The **extract_hier_antenna_property** command extracts all information relevant to antenna rules connected to each port. You can use this information for antenna calculation in the higher-level cell hierarchy to avoid repetitive calculation, and flattening of the data.

The hierarchical antenna properties are calculated based on the following information:

- Routing contained in the CEL view of the top-level cell
- The hierarchical antenna properties of the cell instances
- The gate sizes and the diode protection for each port of the library cells, which you set by loading the CLF file.

The hierarchical antenna properties are stored in the FRAM view of the cell. Both the CEL and FRAM views of the cell must exist before this command is used.

Perquisites

The cell library must be opened first.

Both the CEL view and the FRAM view of the cell must exist and be writable before

you run this command.

The antenna properties of all port instances in the cell must be properly set. Otherwise, the antenna property calculated will not be accurate. You can set the antenna properties by doing either of the following:

- Running the **extract_hier_antenna_property** command on the child cells, if the child cell is placed and routed by Astro or IC Compiler
- Loading a CLF file that contains the gate size and diode protection value of each port, if the child cell is a standard cell

Limitations:

The **extract_hier_antenna_property** command does not work on standard library cells or hard macros because Astro or IC Compiler do not read the diffusion layer in the layout. The results may not be accurate if hard macros exist in the cell design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> extract_hier_antenna_property -cell_name my_cell
```

extract_rc

Executes 2.5D extraction for routes in a design.

SYNTAX

```
status extract_rc
[-coupling_cap]
[-estimate]
[-routed_nets_only]
```

ARGUMENTS

-coupling_cap

Specifies for the extraction to consider coupling capacitance. Specifying this option can cause the Standard Parasitic Exchange Format (SPEF) file to be very large. By default, extraction does not consider coupling capacitance.

-estimate

Performs global routing and delay calculation and back-annotates the delay and capacitance to the current design. After running this command, you can use the **report_timing** command to see the timing result computed from routing and estimation.

-routed_nets_only

Specifies to use the old default behavior when the mixed mode behavior is the default. It extracts only fully routed nets.

DESCRIPTION

This command performs 2.5D extraction from the routes in memory. It calculates delay based on the Elmore delay model.

If you use the **set_tlu_plus_files** command to specify the TLU+ technology files, the tool performs extraction based on TLU+ technology. Otherwise, the tool performs extraction using the extraction parameters in your physical library.

To annotate a physical library with extraction parameters taken from the technology file used by tools that are extractors, use the **extract2plib** system command.

If your physical library does not contain extraction parameters, the tool derives the resistance and capacitance values of routes from the available RC estimation method in your physical library. Use the **RCEX-015** message to determine the RC estimation method used.

To extract coupling capacitance, use the **-coupling_cap** option.

To fine-tune the extraction results, use the **set_extraction_options** command. This command allows you to specify various extraction options, such as scaling factors for resistance and capacitance values.

Multicorner-Multimode Support

This command uses information from both active and inactive scenarios.

EXAMPLES

The following performs global routing and updates back-annotated net delays.

```
prompt> extract_rc -estimate
```

The following example considers coupling capacitance.

```
prompt> extract_rc -coupling_cap
```

SEE ALSO

set_tlu_plus_files(2)
write_parasitics(2)
```

extract_rp_group

Extracts a relative placement group from your design based on your specifying either a collection of cells or a bounding box.

SYNTAX

```
status extract_rp_group
-group_name group_name
[-rows number_of_rows]
[-columns number_of_columns]
[-output file_name]
[-append]
[-physical]
[-nosplit]
[-objects object_list]
[-coordinates coordinate_list]
[-apply]
[-descending]
```

Data Types

<i>group_name</i>	string
<i>number_of_rows</i>	integer
<i>number_of_columns</i>	integer
<i>file_name</i>	string
<i>object_list</i>	collection
<i>coordinate_list</i>	list

ARGUMENTS

```
-group_name group_name
    Specifies a name for the extracted relative placement group. Each relative
    placement group in the design must have a unique name.

-rows number_of_rows
    Specifies the number of rows in the extracted relative placement group. By
    default, the relative placement groups contains one row for each cell in the
    group.

-columns number_of_columns
    Specifies the number of columns in the extracted relative placement group.
    By default, the relative placement group contains one column.

-output file_name
    Specifies the name of the output file to which to write the constraints. By
    default, the constraints are written to the screen.

-append
    Appends constraints to the file specified by the -output option. By default,
    if the specified file exists, it is overwritten.
```

-physical
 Uses the physical location of the cells when extracting the structure of the relative placement group.

-nosplit
 Prevents line splitting when writing the relative placement constraints.

-objects *object_list*
 Specifies the list of cells for the tool to use to extract the relative placement structure.

-coordinates *coordinate_list*
 Gets the cells from the specified bounding box and then uses the physical locations of these cells to extract the relative placement structure. The *coordinate_list* value is in integers.

-apply
 Applies the relative placement constraints generated by the command to the design. By default, the constraints are written out, but are not applied to the design.

-descending
 Adds the cells to the relative placement group in reverse order.

DESCRIPTION

This command allows the creation of relative placement groups using existing characteristics of your design. It extracts relative placement groups from that design in either of the following ways.

- You can specify the contents of the relative placement group either by specifying a collection of cells or by specifying a bounding box containing the cells.
- You can either specify the structure of the relative placement group by specifying the number of rows and columns, or you can let the tool generate the structure based on the physical locations of the cells in the group.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples extract relative placement groups.

```
prompt> extract_rp_group -group_name misc2\  

-objects [get_cells -hier {U2/I12?}] -row 1  

1  

prompt> extract_rp_group -group_name misc9\  

-objects [get_cells -hier {U2/I9?}] -row 1\  

-output rp.tcl -append
```

```
1
prompt> extract_rp_group -group_name ph1 -physical \
-coordinates {0 0 100 100}
1
prompt> extract_rp_group -group_name ph2 -physical \
-objects [get_cells -hier {u2/I9?}]
```

SEE ALSO

extract_zrt_hier_antenna_property

Extracts the hierarchical antenna properties of all the top-level ports in the specified cell. You should use this command for designs routed with Zroute.

SYNTAX

```
status extract_zrt_hier_antenna_property
-cell_name cell_name
```

Data Types

cell_name string

ARGUMENTS

-cell_name *cell_name*
Specifies the cell instance name in the design from which to extract antenna properties.

DESCRIPTION

This command extracts the hierarchical antenna properties of all the top-level ports in the given cell. It is recommended that you use this command for designs routed with zroute. The hierarchical antenna properties include gate size, routing area, and diode protection.

This command should be run within the child cell of each macro and saved. When antenna analysis is done at the top level, the properties that were previously set can be seen in each macro pin. When nets connecting to macro pins are analyzed, the antenna information from each macro pin is used for analyzing that pin. This eliminates repetitive calculation of antenna properties of each macro or flattening the design.

The hierarchical antenna properties are calculated based on the following information:

- Routing contained in the CEL view of the top-level cell.
- The hierarchical antenna properties of the cell instances
- The gate sizes and the diode protection for each port of the library cells, which can be set by loading the CLF file.

The hierarchical antenna properties are stored in the FRAM view of the cell. Both the CEL and FRAM views of the cell must exist before you execute this command.

Perquisites

The design library must be opened first.

Both the CEL view and the FRAM view of the cell must exist and be writable before the command is run.

The antenna properties of all port instances in the cell must be properly set. Otherwise, the antenna property calculated will not be accurate. The antenna properties can be set by:

- Running the **extract_hier_antenna_property** command on child cells, if the child cell is routed by zroute.
- Loading a CLF file that contains the gate size and diode protection value of each port, if the child cell is a standard cell

Limitations

The **extract_hier_antenna_property** command does not work on standard library cells or hard macros because the tool does not read the diffusion layer in the layout. The results might not be accurate if hard macros exist in the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the use of the command on a cell instance named my_cell.

```
prompt> extract_zrt_hier_antenna_property -cell_name my_cell
```

```
SH "SEE ALSO"
```

```
extract_hier_antenna_property(2)
```

filter_collection

Filters a collection, resulting in a new collection. The base collection remains unchanged.

SYNTAX

```
collection filter_collection
base_collection
expression
[-regexp [-nocase]]
```

Data Types

<i>base_collection</i>	collection
<i>expression</i>	string

ARGUMENTS

base_collection
Specifies the base collection to be filtered. This collection is copied to the result collection. Objects are removed from the result collection if they are evaluated as false by the conditional *expression*.

expression
Specifies an expression with which to filter *collection*.

-regexp
Indicates that the real regular expressions are to be used by the `=~` and `!~` filter operators. By default, these filter operators use simple wildcard pattern matching with the '*' and '?' wildcards.

-nocase
Makes the pattern match case-insensitive. You can use the **-nocase** option only if you also use the **-regexp** option.

DESCRIPTION

This command filters a collection after the collection has been created. In many cases, the commands that create collections support a **-filter** option, which performs the filtering as part of the collection process. Using the **-filter** option in those commands is almost always more efficient than using the **filter_collection** command to filter the collection after it has been created. The **filter_collection** command is most useful in the situation where you want to filter the same large collection many times using different criteria.

The **filter_collection** command results in either a new collection containing the subset of the objects in the input specified by using the *base_collection*, or it results in the empty string (an empty collection) indicating that the *expression* filtered out all elements of the input *base_collection*.

The basic form of the conditional expression is a series of relations joined

together with AND and OR operators. Parentheses are also supported. The basic relation contrasts an attribute name with a value by using a relational operator. For example, given the following information:

```
is_hierarchical == true and area <= 6
```

the relational operators are the following:

```
== Equal
!= Not equal
> Greater than
< Less than
>= Greater than or equal to
<= Less than or equal to
=~ Matches pattern
!~ Does not match pattern
```

and the basic relational rules are the following:

- String attributes can be compared with any operator.
- Numeric attributes cannot be compared with pattern match operators.
- Boolean attributes can be compared only with == and !=. The value can be only true or false.

For a complete description of conditional expressions, see the reference manual for the tool.

Regular expression matching is the same as in the Tcl **regexp** command. When using the **-regexp** option, be careful how you quote the filter expression. Using rigid quoting with curly braces around regular expressions is recommended. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding ".*" to the beginning or end of the expressions, as needed. You can make the regular expression search case-insensitive by using the **-nocase** option with the **-regexp** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a collection of only hierarchical cells.

```
prompt> set a [filter_collection [get_cells *]"is_hierarchical == true"]\n{"Adder1", "Adder2"}
```

The following example creates a collection with an input range from 18 to 23.

```
prompt> set a [filter_collection [all_inputs]-regexp {name=~"in\(([1][8-9] | [2][0-3])\}]\n{"in[23]", "in[22]", "in[21]", "in[20]", "in[19]", "in[18]"}
```

SEE ALSO

fix_flcc_hotspot

Performs lithography hot spot fixing. FLCC stands for Fast Lithography Compliance Check.

SYNTAX

```
fix_flcc_hotspot
```

DESCRIPTION

This command requires two files to execute: fixHotSpots.ev and fixHotSpots.util. User should have these two files in the working directory before running this command.

No error cell will be generated after fix_flcc_hotspot, since there is no direct way to know if the original flcc hotspots are fixed or if new flcc hotspots are created by fixing. User has to save the design and rerun detect_flcc_hotspot and extract_flcc_hotspot to get such info.

Multicorner Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command performs fix_flcc_hotspot.

```
prompt> fix_flcc_hotspot
```

SEE ALSO

```
detect_flcc_hotspot(2)  
extract_flcc_hotspot(2)
```

fix_isolated_via

Fixes isolated via violations by inserting hang-on vias in specified range.

SYNTAX

```
integer fix_isolated_via
[-isolated_via_spacing distance]
[-isolated_via_quadrant_spacing distance]
```

Data Types

distance distance

ARGUMENTS

-isolated_via_spacing *distance*

Determines the adjacent via spacing, in microns, that triggers isolated via violation. If there is no adjacent via located less than n microns from the via, the violation of type "Isolated Via" is fixed. If set, this argument will be stored in a "droute" cell parameter "isolatedViaSpacing". The range is 0.0 to 20.0. The default is the value, set in a "droute" cell parameter "isolatedViaSpacing", which in turn has a default of 1.0.

To set a distance in a "droute" cell parameter "isolatedViaSpacing", use
set_parameter -type real -module droute \
 -name isolatedViaSpacing -value n

-isolated_via_quadrant_spacing *distance*

Determines the adjacent via spacing, in microns, in four quadrants. If adjacent vias that cover all four quadrants are not located less than n microns from the via, the violation of type "Isolated Via" is fixed. If set, this argument will be stored in a "droute" cell parameter "isolatedViaQuadrantSpacing". The range is 0.0 to 50.0. The default is the value, set in a "droute" cell parameter "isolatedViaQuadrantSpacing", which in turn has a default of 10.0.

To set a distance in a "droute" cell parameter "isolatedViaQuadrantSpacing", use

```
set_parameter -type real -module droute \
                  -name isolatedViaQuadrantSpacing -value n
```

DESCRIPTION

This command is used to fix isolated vias rule violations. If two vias are not aligned, corner-to-corner spacing is measured for *isolated_via_spacing* and *isolated_via_quadrant_spacing*. If two vias are aligned, edge-to-edge spacing is measured for *isolated_via_spacing* and *isolated_via_quadrant_spacing*. This command will check and fix *isolated_via_spacing* first, and then *isolated_via_quadrant_spacing*. The value of *isolated_via_quadrant_spacing* should be greater than *isolated_via_spacing*. Please be advised that greater values affect the speed of command execution. The via inserted by this feature will be connected to one metal layer, and hence will be a hang-on via. This command needs to be used just before GDS out.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example fixes isolated vias rule violations for adjacent vias that are located less than 5.0 microns from the via (isolated_via_quadrant_spacing is 10.0 by default):

```
prompt> fix_isolated_via -isolated_via_spacing 5.0
```

APPENDIX

The following settings stored in "drouite" cell parameters, and set in command **set_parameter**, will control defaults and operation of **fix_isolated_via** command:

Common for all via layers parameters:

"isolatedViaSpacing" and "isolatedViaQuadrantSpacing".

The range for "**isolatedViaSpacing**" is 0.0 to 20.0. The default is 1.0. The range for "**isolatedViaQuadrantSpacing**" is 0.0 to 50.0. The default is 10.0.

To set these parameters, use:

```
set_parameter -type real -module drouite \
              -name isolatedViaSpacing -value n
set_parameter -type real -module drouite \
              -name isolatedViaQuadrantSpacing -value n
```

To fix isolated via violations on specified via layers only, the following settings should be set with command **set_parameter**:

"checkIsolatedViaPerLayer" - if this parameter is set, the rule is applied only to cut layers, which have "per-layer" isolated via spacing set, and if it is not set, the rule is applied to all cut layers. Valid values are 0 (which is the default) and 1. If it is set to 1, the values of common for all via layers parameters "**isolatedViaSpacing**" and "**isolatedViaQuadrantSpacing**" are ignored. The arguments to **fix_isolated_via** command that also can set these common parameters, - **isolated_via_spacing** and **-isolated_via_quadrant_spacing**, are also ignored.

To set or reset this run-time integer parameter, use:

```
set_parameter -type int -module drouite \
              -name checkIsolatedViaPerLayer -value n
```

To set "per-layer" isolated via spacing and isolated via quadrant spacing, use the following real parameters:

```
set_parameter -type real -module drouite \
              -name polyContIsolatedViaSpacing -value n
set_parameter -type real -module drouite \
```

fix_isolated_via

```

        -name via1IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via2IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via3IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via4IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via5IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via6IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via7IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via8IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via9IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via10IsolatedViaSpacing -value n
set_parameter -type real -module droute \
        -name via11IsolatedViaSpacing -value n

set_parameter -type real -module droute \
        -name polyContIsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via1IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via2IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via3IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via4IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via5IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via6IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via7IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via8IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via9IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via10IsolatedViaQuadrantSpacing -value n
set_parameter -type real -module droute \
        -name via11IsolatedViaQuadrantSpacing -value n

```

The range for "per-layer" isolated via spacing is 0, 20.0; the default is 0.0, which disables processing isolated via rule on the specified via layer. The range for "per-layer" isolated via quadrant spacing is 0, 50.0; the default is 0.0, which disables processing isolated via quadrant rule on the specified via layer.

SEE ALSO

`report_isolated_via(2)`

```
set_parameter(2)
report_parameter(2)
```

fix_lcc_hotspot

Performs lithography compliance check (LCC) hotspot fixing.

SYNTAX

```
status fix_lcc_hotspot
-lcc_file_path lcc_path_name
[-types list_of_types]
[-level level]
[-num_loops number_of_loops]
[-num_cpus number_of_cpus]
```

Data Types

<i>lcc_path_name</i>	string
<i>list_of_types</i>	list
<i>level</i>	double
<i>number_of_loops</i>	integer
<i>number_of_cpus</i>	integer

ARGUMENTS

-lcc_file_path *lcc_path_name*

Specifies a directory of LCC files, which contains the runsets necessary for LCC detection jobs. The *lcc_path_name* value must be a full path.

-types *list_of_types*

Specifies the types of hotspots to fix and detect. Each type represents a specific geometric combination of shapes. Currently, LCC has the following 5 valid types: **line**, **lineend**, **space**, **slotend**, and **voc**. You can choose any list of types to fix. The default is to fix all types.

-level *level*

Specifies the levels to fix when performing level-based LCC fixing. If you use this option, the command fixes only hotspots whose level is under the *level* value or equal to it. This means that the hotspots under this level are more serious than the hotspots at *level* or above.

The two level systems are LCC-t and LCC-g. The LCC-t level system has the following 4 valid values: **1**, **2.1**, **2.2**, and **2.3**. For example, if you set *level* to 2.1, the command fixes only hotspots whose level is 1 or 2.1 and ignores hotspots at level 2.2 and 2.3. The default value for the LCC-t level system is 2.1. The LCC-g level system has the following 5 valid values: **1**, **2**, **3**, **4**, and **5**. The default value for the LCC-g level system is 2. IC Compiler gets the correct level system (LCC-t or LCC-g) from LCC runsets, but you should know which level system is used and should enter the correct level value for this option.

-num_loops *number_of_loops*

Specifies the number of loops the command is to run. If the command executes the specified number of loops and all DRC (design rule check) and LCC hotspots are clean, the command stops. The default value is 50.

-num_cpus *number_of_cpus*

Specifies the number of CPUs the command uses to launch LCC checking jobs. The default value is 1.

DESCRIPTION

This command attempts to fix LCC hotspots with an iterative tool-fixing and LCC-checking flow. Before running this command, the design must be DRC clean; otherwise there is no guarantee of convergence or fixing quality. Before fixing, two fix-guidance files named out00 and fout00 must exist under the working directory. These two files are generated by the **detect_lcc_hotspot** command and contain information on detected hotspots.

In each iteration, the tool first tries to fix hotspots by local-fix and reroute. Since new DRC violations or new LCC hotspots might be generated after fixing, the tool performs internal DRC checking and LCC jobs are launched to check the changed patterns to determine if new hotspots have been generated. The process runs until all LCC hotspots and DRC violations are clean or the iteration number has reached the value specified by *number_of_loops* in the **-num_loops** option. Most convergeable designs converge in less than 10 iterations.

Since run time can be long, distributed processing flow is suggested. Before running the distributed processing **fix_lcc_hotspot** command, you must run the **set_distributed_route** command to set the machines to be used. In this case, you should set *number_of_cpus* in the **-num_cpus** option to a value greater than 1.

An error cell named <top_cell_name>_lcchs.err is created after running the **fix_lcc_hotspot** command. You can open this error cell to browse remaining LCC hotspots in the current design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the command running on multiple Linux hosts.

```
prompt> set_distributed_route\
-jp_machines {linux1 linux2 linux3 linux4 linux5}
prompt> fix_lcc_hotspot\
-lcc_file_path /root/LCC/Local-LCC\
-types {line space lineend slotend}\\
-num_cpus 10 -level 1
```

SEE ALSO

detect_lcc_hotspot(2)
report_lcc_hotspot(2)
set_distributed_route(2)

flatten_clock_gating

Restructures integrated clock gating (ICG) cells to flatten the hierarchy of the clock tree for clock mesh creation.

SYNTAX

```
status flatten_clock_gating
-icgs cells
  | -mesh_nets nets
  | -clocks clocks
[-max_depth positive_integer]
[-optimize]
```

Data Types

<i>cells</i>	collection of one or more cells
<i>nets</i>	collection of one or more nets
<i>clocks</i>	collection of one or more clocks

ARGUMENTS

```
-icgs cells
      Specifies the ICG cells to be restructured. Each specified cell must be an
      ICG, and its clock input must be driven by another ICG. Cells that do not
      meet these requirements are ignored.

-mesh_nets nets
      Flattens the ICG cells that are driven by the specified mesh nets.

-clocks clocks
      Flattens the ICG cells that are on the specified clock paths.

-max_depth positive_integer
      Specifies the maximum hierarchical level of ICGs driving other ICGs after
      flattening. The default is 1. A value greater than 2 is unusual.

-optimize
      Restructures the logic after flattening to reduce the fanout or optimizes the
      structure.
```

DESCRIPTION

To create a good clock mesh design requires a low hierarchical level of logic tree under the mesh; otherwise, you do not get the benefit of low clock skew. You should avoid creating high logic-level trees under the clock mesh nets.

Because most ICGs are added by Power Compiler, the simplest approach is to limit the hierarchical level of ICGs by setting the appropriate options in Power Compiler. You can use **remove_clock_gating** in Power Compiler or **flatten_clock_gating** in IC Compiler to flatten the circuitry under the mesh. The **remove_clock_gating** command removes ICGs created by Power Compiler and replaces them with MUXs on the inputs to

registers. Rather than removing ICGs, the **flatten_clock_gating** command reconnects ICGs that are driven by other ICGs to make them directly driven by the clock source.

To retain the same logic behavior, the command adds circuitry to use the original enable signal and the enable signal of the parent ICG as inputs to the logic AND function. (Logical OR is used if the ICG enable pin has a negative enable sense.) Therefore, the resulting clock output should have the same logic behavior as the original output, but with one less level of gating between it and the clock root.

You should specify which gates to flatten when using this command. You can specify a collection of ICGs with the **-icgs** option. If you specify **-mesh_net**, the command searches recursively for ICGs driven by the specified mesh nets. ICGs that are deeper than the specified value by **-max_depth** will be flattened. The **-clock** option works similarly to the **-mesh_net** option, except that it searches for ICGs from the root of the clock tree.

By default, the command restructures the logic with an AND or OR gate for each flattened ICG. If the **-optimize** option is used, it restructures the logic to reduce electrical rule violations. However, the circuitry generated by this command might require further synthesis to meet timing and electrical constraints.

LIMITATIONS

This command is not as powerful or general as Power Compiler commands. It is better to use **remove_clock_gating**, **optimize_clock_gates**, or other standard synthesis operations if they can be applied to your designs.

This command only removes the lowest level of ICGs driving other ICGs. That is, if there are three levels of ICGs, this command will reduce them to two levels. If further restructuring is needed, repeat this command.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example flattens the ICGs in the clk1 clock path to a hierarchical level of 2.

```
prompt> flatten_clock_gating -clock clk1 -max_depth 2
```

SEE ALSO

```
identify_clock_gating(2)  
report_clock_gating_check(2)
```

flatten_fp_black_boxes

Flattens objects to remove them from the physical cell and restore them to hierarchy preservation (logical view).

SYNTAX

```
status flatten_fp_black_boxes
black_boxes
```

Data Types

black_boxes collection

ARGUMENTS

black_boxes
Specifies a collection of black boxes to flatten.

DESCRIPTION

This command flattens objects to remove them from the physical cell and restore them to hierarchy preservation (logical view).

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example flattens the black box named *alu1*.

```
prompt> flatten_fp_black_boxes [get_cells alu1]
```

SEE ALSO

estimate_fp_black_boxes(2)
get_cells(2)

flatten_fp_hierarchy

Removes a level of hierarchy.

SYNTAX

```
int flatten_fp_hierarchy
cell_list
[-input_sdc_file input_file_name]
[-output_sdc_file output_file_name]
[-load_back_sdc]
[-prefix prefix_name]
[-simple_name]
[-no_backslash_for_hierarchy_delimiter]
```

Data Types

<i>cell_list</i>	collection
<i>input_file_name</i>	string
<i>output_file_name</i>	string
<i>prefix_name</i>	string

ARGUMENTS

cell_list
Specifies a collection of cells in the current design that are to be flattened. The contents of these cells are brought up to the same level as the cells.
You can specify a collection of cells using the full name of each cell. Note that the following conditions might cause you to encounter a "User input data check failed" error:

- You specified a non-existent cell.
- You specified a leaf cell.
- The logical parent of the cell is multiply instantiated.
- A plan group is defined on the cell you specified.
- Two cells are on the same hierarchy path (for example, both A/B and A/B/C are specified).

You can pass the "input data check" by analyzing your *cell_list* specification to correct for these conditions.

-input_sdc_file *input_file_name*
Specifies a Synopsys Design Constraints (SDC) file to update to reflect the netlist change. This SDC file should contain valid SDC commands for the current design.

-output_sdc_file *output_file_name*
Specifies the name of the output SDC file into which to write the updated SDC constraints. You should use this option with the **-input_sdc_file** option.

```

-load_back_sdc
    Specifies that the updated SDC constraints should also be applied on the
    current design. You should use this option with the -input_sdc_file option.

-prefix prefix_name
    Specifies the prefix in naming flattened cells. The naming format is as
    follows:

        <prefix>original_cell_name
    Avoid using the hierarchy delimiter in the specified prefix.
    This option is mutually exclusive with the -simple_name and -
no_backslash_for_hierarchy_delimiter options.

-simple_name
    Specifies that simple, non-hierarchical names are to be used for those cells
    under the flattened cell.
    For this option, cells maintain their original names. Since name clashing
    might happen when using the simple name, this command simply adds a "_1"
    suffix to avoid duplication. For example, if a cell named abc is under a
    flattened module named B and there is already an abc cell in the same level
    as the flattened module B, this command names the original cell B/abc to abc_1
    to avoid clashing with the same level cell abc.
    This option is mutually exclusive with the -prefix and -
no_backslash_for_hierarchy_delimiter options.

-no_backslash_for_hierarchy_delimiter
    Specifies that the command does not add backslashes before the hierarchy
    delimiter. By default, the flattened cell's name and a backslashed hierarchy
    delimiter is used as the prefix of a new name.
    For example, the cell named C under module B's full name is A/B/C. After
    flattening module B, the cell C's full name is A/B\C and its single name is
    B\C. By doing this, the application can easily process B\C as a whole single
    name, not a normal full name such as B/C. If you want C's single name to look
    like B/C, you must specify this option.
    This option is mutually exclusive with the -simple_name and -prefix options.

```

DESCRIPTION

Removes a single level of hierarchy from the current design by bringing up the contents of the specified cells to the same level as the cells.

By default, this command uses the flattened cell's name as the prefix of those flattened cells. For example, after flattening A/B, the original cell named C under cell B would have the new name B\C, if the hierarchy delimiter is a "/" (slash).

By specifying the **-no_backslash_for_hierarchy_delimiter** option, the new name contains no backslash for the hierarchy delimiter and looks like B/C.

By specifying the **-simple_name** option, the cell C's name would not be changed in the example shown above.

By specifying the **-prefix** option with the name *my_prefix*, the cell C's name would be prefixed and changed to *my_prefixC*.

If you do not specify a prefix, the default is in the following format:

```
<flatten_cell_name>/old_cell_name
```

This command does not automatically update Synopsys Design Constraints (SDC) information stored in the current design unless you specify the **-input_sdc_file** and **-output_sdc_file** options or you reapply the SDC file later.

This command also removes design constraints stored in the current design, since the merge operation would produce inconsistencies with the existing design constraints. You must reapply design constraints after running this command.

This command ignores the **dont_touch** attribute on hierarchy cells. Any specified cell would be flattened by this command, so you must pay attention to the flatten cell list if you really want to leave such cells unchanged.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example flattens a specified list of cells.

```
prompt> flatten_fp_hierarchy {u1 u2 u3}
```

The following example specifies a collection of cells.

```
prompt> flatten_fp_hierarchy [get_cells u*]
```

The following example flattens a specific cell and specifies the prefix to use.

```
prompt> flatten_fp_hierarchy {u1} -prefix "U1:"
```

The following example flattens the cell instances named *MID1/BOT1/FOO1* and *MID1/BOT1/FOO2*. *MID1/BOT1* is a unique instantiation of a design named *BOT*.

```
prompt> flatten_fp_hierarchy {MID1/BOT1/FOO1 MID1/BOT1/FOO2}
```

SEE ALSO

merge_fp_hierarchy(2)

flip_mim

Flips the cell placement in a multiple instantiated module (MIM) plan group.

SYNTAX

```
status flip_mim
[-direction X | Y]
collection
```

Data Types

collection list

ARGUMENTS

-direction X | Y
Identifies the direction of the flip on an x-axis or y-axis.

collection
Specifies a list containing the multiple instantiated plan groups to flip.

DESCRIPTION

This command flips MIMs on an x-axis or y-axis. MIMs are modules that have the same reference. A set of these modules is called a MIM group. A design can have more than 1 MIM group. For example, if modules A1 and A2 have reference A and modules B1 and B2 have reference B, they form 2 MIM groups.

This command flips MIMs during the virtual flat stage. This is the period when MIMs are physically represented in the design as plan groups. Flipping includes flipping the placement of all cells in the given MIM and also flipping the shape of the MIM. During flipping, the bounding box of the plan group does not move. One way to visualize this process is that the resulting placement after flipping is the same as if the plan group were converted to a soft macro, flipped, and then converted back to a plan group.

Note that even if standard cells are placed at legal locations before flipping, it is not guaranteed that they will be legal after flipping. This command prints a warning if it determines that the resulting cells might not be placed at legal locations after the flip.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows flipping a MIM in the x-direction.

```
prompt> flip_mim -direction X M1
```

SEE ALSO

`copy_mim(2)`
`report_mim(2)`

flip_objects

Flips one or more movable objects.

SYNTAX

```
status flip_objects
[-anchor anchor_point]
[-direction x | y | -x float | -y float]
[-flip_transform]
[-ignore_fixed]
objects
```

Data Types

<i>anchor_point</i>	string
<i>objects</i>	collection

ARGUMENTS

-anchor *anchor_point*

Specifies an anchor point to flip the object. Use one of the following valid values for *anchor_point*.

ll - lower-left corner of the object.

ur - upper-right corner of the object.

center - center of the object.

The default value of this option is **ll**.

-direction *x* | *y* | -*x* *float* | -*y* *float*

Specifies the direction of the flip. The **x** or the **y** options indicates the direction of the flip about the anchor point if neither **-x** nor **-y** options are specified.

If an anchor point is not specified, enter the exact x-coordinate for the **-x** option. If an anchor point is specific, enter the x-offset from the x-coordinate of the the anchor point for the **-x** option. The resultant x-coordinate indicates the position of the vertical line to flip the objects. The value of the **-x** option is in user-units.

If an anchor point is not specified, enter the exact y-coordinate for the **-y** option. If an anchor point is specified, enter the y-offset from the y-coordinate of the anchor point for the **-y** option. The resultant y-coordinate indicates the position of the horizontal line to flip the objects. The value of the **-y** option is in user-units.

-flip_transform

Specifies that the transform of the object (if it has one) is flipped as well as the position. By default, the transform is not flipped.

-ignore_fixed

Indicates that fixed objects are flipped. Normally fixed objects are not flipped.

objects

Specifies the list of objects to be flipped.

DESCRIPTION

If the **-x** option and **-y** option are not specified, this command flips the position of the specified objects by swapping the corresponding anchor point of each object. See the Swapping Objects section below. If the **-x** option is specified, the objects are flipped about the vertical line at the specified x-coordinate. See the Flipping at X section below. If the **-y** option is specified then the objects are flipped about the horizontal line at the specified y-coordinate. See the Flipping at Y section below. Flipping is essentially a move operation. For details on which objects are moveable see the **get_edit_property** command.

Swapping Objects

To swap objects, the objects are first sorted from left to right or top to bottom depending on the bounding box of all objects. If the bounding box of all objects is larger horizontally, objects are sorted from left to right. If the bounding box is larger vertically, objects are sorted from top to bottom.

The objects are swapped using the following steps.

1. Get object at the start of the object list (object 1)
2. Get object at end of the list (object 2)
3. Swap object anchor positions (object 1 is moved to object 2's anchor position and object 2 is moved to object 1's anchor position).
4. Remove the two selected objects from the list
5. Repeat until the list has less than 2 entries

For example, if the list of objects are A, B, C, D, and E, then A is swapped with E and B is swapped with D. C remains untouched.

If the object has a transform and the **-flip_transform** option is specified, then the transform is also mirrored in the X direction (sort left to right) or Y direction (sort top to bottom).

This operation is useful with sets of objects of the same size and type such as pins or hard macros, where the order needs to be reversed.

Flipping at X

To flip objects about an x-coordinate, the x-values of the boundaries of each object are mirrored about the x-value of the vertical line specified by the **-x** and **-anchor** options. The object then has its boundary set to the new value.

If the object has a transform and the **-flip_transform** option is specified then the transform is also mirrored in the x-direction.

This operation is useful when swapping the order of a set of standard cells on a horizontal row.

Flipping at Y

To flip objects about an y coordinate, the y values of the boundaries of each object are mirrored about the y value of the vertical line specified by the `-y` and `-anchor` options. The object then has its boundary set to the new value.

If the object has a transform and the `-flip_transform` option is specified then the transform is also mirrored in the Y direction.

This operation is useful when swapping the transform of a set of standard cells on a horizontal row.

NOTE

Snapping is done automatically by using global snap settings.

EXAMPLES

The following example swaps the lower-left corner of each selected object with its corresponding selected object.

```
prompt> flip_objects [get_selected] -anchor 11
```

The following example flips position and transform of the selected objects about the center of the objects' surrounding bounding box.

```
prompt> flip_objects [get_selected] -x 0 -anchor center -flip_transform
```

The following example flips the selected objects about the horizontal line at y=100.

```
prompt> flip_objects [get_selected] -y 100
```

```

focal_opt

Performs postroute optimization to fix setup, hold, or logical design rule constraint (DRC) violations on the design. The selected optimization is referred to as the *focal metric*.

SYNTAX

```
status focal_opt
-setup_endpoints all | file_name
  | -hold_endpoints all | file_name
  | -drc_nets all | file_name
[-effort medium | high]
[-size_only_mode density | in_place | footprint]
[-prioritize]
```

ARGUMENTS

-setup_endpoints all | file_name
Optimizes the specified endpoints by using setup time as the focal metric.
To optimize all endpoints with setup violations, specify **all**. To optimize specific endpoints, specify the name of a file that contains the list of endpoints. The format for defining the endpoints in the file is described in the FILE FORMATS section of this man page. The tool will automatically set the slack value of the specified endpoint with the value specified in the given file. This feature can be turned off by using the **focalopt_endpoint_margin** variable.
The **-setup_endpoints**, **-hold_endpoints**, and **-drc_nets** options are mutually exclusive. You must specify one, and only one, of these options.

-hold_endpoints all | file_name
Optimizes the specified endpoints by using hold time as the focal metric.
To optimize all endpoints with hold violations, specify **all**. To optimize specific endpoints, specify the name of a file that contains the list of endpoints. The format for defining the endpoints in the file is described in the FILE FORMATS section of this man page. The tool will automatically set the slack value of the specified endpoint with the value specified in the given file. This feature can be turned off by using the **focalopt_endpoint_margin** variable.
The **-setup_endpoints**, **-hold_endpoints**, and **-drc_nets** options are mutually exclusive. You must specify one, and only one, of these options.

-drc_nets all | file_name
Optimizes the specified nets by using logical DRCs as the focal metric.
To optimize all nets with logical DRC violations, specify **all**. To optimize specific nets, specify the name of a file that contains the list of nets. The format for defining the nets in the file is described in the FILE FORMATS section of this man page.
The **-setup_endpoints**, **-hold_endpoints**, and **-drc_nets** options are mutually exclusive. You must specify one, and only one, of these options.

-effort medium | high
Specifies the effort level for postroute optimizations in the **focal_opt** flow.

Valid values are

- * **medium** (the default)
When you specify **medium** effort, more solution spaces are explored while fixing the violations, including solutions that exceed the density limit.
- * **high**
When you specify **high** effort, even more solution spaces are explored, which requires more CPU time. In addition, optimization uses runtime-expensive accurate signal integrity re-estimation, which is not required for all designs.
You should use **high** effort only when you have a few remaining violations to close.

These aggressive approaches are employed in the medium and high effort levels to enable **focal_opt** to achieve good results; however, the aggressive approaches can result in convergence issues.

Both effort levels honor **set_cost_priority** and **set_fix_hold_options**.

```
-size_only_mode density | in_place | footprint
    Restricts the topology-based optimizations to cell sizing.
    You can use this option for designs very sensitive to postroute optimization changes. You can control the sizing effort by using the different sizing modes:
    * density
        Use regular density-based sizing.
    * in_place
        Use in-place sizing.
    * footprint
        Use footprint-preservation sizing.

-prioritize
    Performs an extra optimization iteration in which the cost priority changes to give the focal metric the highest priority. The -prioritize switch will be ignored if user has redefined cost priority by using set_cost_priority command..
```

DESCRIPTION

The **focal_opt** command fixes either setup, hold, or logical DRC violations in the design by performing topology-based optimization. You must select one metric to use for each **focal_opt** run.

The optimization techniques used in **focal_opt** are more expensive and aggressive than those used in **route_opt**. The **focal_opt** command is best used for fixing the few violations remaining after running **route_opt** and **route_opt -incremental**. It should not be used as a replacement for **route_opt** and **route_opt -incremental** because it focuses on only one metric in each iteration.

FILE FORMAT

Endpoint File

The **-setup_endpoints** and **-hold_endpoints** options use a file that specifies the

endpoints to optimize.

For each endpoint, you can specify either only the endpoint or the endpoint with a slack value, as shown below. The best way to generate these lines is by editing the file generated by the **report_constraint** command.

A. Only the endpoint

I_STACK_TOP/I3_STACK_MEM/Stack_Mem_reg_2__1_/D

B. Endpoint with slack

I_STACK_TOP/I3_STACK_MEM/Stack_Mem_reg_2__1_/D	-0.14	(VIOLATED)	
I_STACK_TOP/I3_STACK_MEM/Stack_Mem_reg_2__1_/D	0.58	0.44	r
0.14	(VIOLATED)		-

C. Endpoint with slack for MCMM designs

I_STACK_TOP/I3_STACK_MEM/Stack_Mem_reg_2__1_/D	-0.14	(VIOLATED)	SCENARIO1
I_STACK_TOP/I3_STACK_MEM/Stack_Mem_reg_2__1_/D	0.58	0.44	r
0.14	(VIOLATED)	SCENARIO1	-

Net File

The **-drc_nets** option usase a file that specifies the nets to optimize.

For each net, you can specify either only the net name or the net name with the violation, as shown below. The best way to generate these lines is by editing the file generated by the **report_constraint** command.

A. Only the net name

I_STACK_TOP/n342

B. Net name with violation

I_STACK_TOP/n342	0.70	0.89	-0.19	(VIOLATED)
------------------	------	------	-------	------------

EXAMPLES

The following example runs **focal_opt** to fix the setup violations.

```
prompt> focal_opt -setup_endpoints all
```

The following example runs **focal_opt** to fix the subset of hold violations specified in the hold_vio.txt file with hold as the highest priority cost.

```
prompt> focal_opt -hold_endpoints hold_vio.txt -prioritize
```

SEE ALSO

```
report_constraint(2)
route_opt(2)

set_cost_priority(2)
routeopt_density_limit(3)
focalopt_endpoint_margin(3)
```

foreach_in_collection

Iterates over the elements of a collection.

SYNTAX

```
string foreach_in_collection
itr_var
collections
body
```

Data Types

<i>itr_var</i>	collection
<i>collections</i>	list
<i>body</i>	string

ARGUMENTS

<i>itr_var</i>	Specifies the name of the iterator variable.
<i>collections</i>	Specifies a list of collections over which to iterate.
<i>body</i>	Specifies a script to execute per iteration.

DESCRIPTION

This command is used to iterate over each element in a collection. You cannot use the Tcl-supplied **foreach** command to iterate over collections, because **foreach** requires a list, and a collection is not a list. Using **foreach** on a collection would cause the collection to be deleted.

The arguments to **foreach_in_collection** parallel those of **foreach**: an iterator variable, the collections over which to iterate, and the script to apply at each iteration. Note that **foreach_in_collection** does not allow a list of iterator variables.

During each iteration, the *itr_var* option is set to a collection of exactly one object. Any command that accepts *collections* as an argument accepts *itr_var*, because they are of the same data type (collection).

You can nest the **foreach_in_collection** command within other control structures, including **foreach_in_collection**.

Note that if the body of the iteration is modifying the netlist, it is possible that all or part of the collection involved in the iteration could be deleted. The **foreach_in_collection** command is safe for such operations. If a command in the body causes a collection to be removed, at the next iteration, the iteration ends with a message indicating that the iteration ended prematurely.

An alternative to collection iteration is to use complex filtering to create a collection that includes only the desired elements, and then apply one or more commands to that collection. If the order of operations does not matter, the following examples are equivalent. The first is an example without iterators.

```
prompt> set s [get_cells {U1/*}]\ncommand1 $s\\ncommand2 $s\\nunset s
```

The following example is equivalent to the example above, only it uses the **foreach_in_collection** command.

```
prompt> foreach_in_collection itr [get_cells {U1/*}] {\ncommand1 $itr\\ncommand2 $itr\\n}
```

For collections with large numbers of objects, the non-iterator version is more efficient, although both produce the same results if the commands are order-independent.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the wire load model from all hierarchical cells in the current instance.

```
prompt> foreach_in_collection itr [get_cells *] {\nif {[get_attribute $itr is_hierarchical] == "true"} {\nremove_wire_load_model $itr\\n}\n}\n\nRemoving wire load model from cell 'i1'.\nRemoving wire load model from cell 'i2'.
```

[filter_collection\(2\)](#)
[query_objects\(2\)](#)

format_lib

Converts one or more input libraries to equivalent output libraries.

SYNTAX

```
status format_lib -f file_name
```

Data Types

file_name string

ARGUMENTS

```
-f file_name
    Specifies a command file file_name.
```

DESCRIPTION

This command converts one or more input libraries to equivalent output libraries, according to commands and options in the command file specified by *file_name*.

Command-File Syntax

The various settings and options that are required by the **format_lib** command are specified in the command-file using the simple syntax shown below:

```
set option_name value
```

where the *option_name* can be one of the following described in the sections below.

Compact CCS Options

```
set compact_ccs (true|false)
    convert expand CCS library to compact CCS library. [false]

set input_library string
    input library file name

set output_library string
    output library file name
```

Expand CCS Options

```
set expand_ccs (true|false)
    convert compact CCS library to expand CCS library. [false]
```

```

set input_library string
    input library file name

set output_library string
    output library file name

```

VA merge Options

```

set va_merge (true|false)
    merge nominal library with several va_libraries into one Unified VA library.
    [false]

set nominal_library <nomlib_name> <par1> <nval1> <par2> <nval2>... <parN> <nvalN>
    set input nominal library file name, followed by va_parameter name and their
    nominal values. va_parameter and nominal values must appear in pair. No
    default value for any va_parameters.

set output_library string
    output library file name

set va_library_list <lib1> <var11> <val21> ... <valN1> <lib2> <var12> <var22> ...
<varN2>...
    set va_libraries, with va_values for each va_parameters followed each library
    name. The order of va_values must be exactly same with the order of
    va_parameters and va_nominal_values in "set nominal_library" command.

set slew_indexes <n1> <n2> ... <nx>
    slew indexes picking. If specified, data corresponding to selected indexes
    in va_libraries will be output into Unified VA library. [all]

set load_indexes <n1> <n2> ... <nx>
    load indexes picking. If specified, data corresponding to selected indexes
    in va_libraries will be output into Unified VA library. [all]

```

CCS noise merge Options

```

set ccsn_merge (true|false)
    merge one CCS timing library and one CCS noise library into one. [false]

set timing_library string
    timing library file name

set noise_library string
    noise library file name

set output_library string
    output library file name

```

CCS to ECSV Options

```

set ccs2ecsm (true|false)
    convert CCS library to ECSV library. If more than one input library provided,

```

it will scale these libraries to target PVT first then convert to an ECSM library. If indexes (slew/load) of one specific arc among different libraries in library list are different, ccs2ecsm will always use those in first library in list as desired indexes. [**false**]

```
set library_list <lib1> <lib2> ... <libN>
    input library list

set process value
    target process for scaling

set voltage value
    target voltage for scaling

set temperature value
    target temperature for scaling

set output_library string
    output library file name

set capacitance_mode (first/second/ave/min/max)
    set which method to use for conversion of CCS receiver capacitance to ECSM capacitance. First means select receiver_cap1; second means receiver_cap2; ave means average, i.e., (receiver_cap1+receiver_cap2)/2.0; min means minimum of receiver_cap1 and receiver_cap2; max means maximum of receiver_cap1 and receiver_cap2. [first].
```

```
set sample <vs1> <vs2>...<vsN>
    desired voltage sample points. [0.05 0.10 0.20 0.30 0.40 0.50 0.60 0.70 0.80
    0.90 0.95].
```

CCS to NLDM Options

```
set ccsldm (true|false)
    convert CCS library to NLDM library. If more than one input library provided,
    it will scale these libraries to target PVT first then convert to an NLDM
    library. If indexes (slew/load) of one specific arc among different libraries
    in library list are different, ccs2nldm will always use those in first library
    in list as desired indexes. [false]

set library_list <lib1> <lib2> ... <libN>
    input library list

set process value
    target process for scaling

set voltage value
    target voltage for scaling

set temperature value
    target temperature for scaling

set output_library string
    output library file name
```

EXAMPLES

The following example shows a command file called f.cmd and its usage:

```
set compact_ccs true  
set input_library in.lib  
set output_library out.lib  
prompt> format_lib -f f.cmd
```

generate_qtm_model

Generate Quick Timing Model (QTM) from design CEL view.

SYNTAX

```
string generate_qtm_model
[-block name_list]
-clock_definitions filename_or_cellname_filename_pairs
[-directory directory_name]
```

Data Types

<i>directory_name</i>	string
-----------------------	--------

ARGUMENTS

-block *name_list*

Specify the list of names for the soft macros in current design that you want to create Quick Timing Model for. This is an optional option. By default, The Quick Timing Model for the current design is created.

-clock_definitions *filename_or_cellname_filename_pairs*

Specify the SDC file(s) which contain clock information for the design or the soft macros. When creating QTM for the current design, use this option without the option **-block**, and provide a SDC file name with this option. When creating QTMs for the soft macros inside current design, use this option together with the option **-block**, and specify a list of cellname-filename pairs with this option to provide one SDC file for each soft macro cell. This is a required option.

-directory *directory_name*

Specify the directory where QTM files will be written to. This is an optional option. By default, the files are written to the current working directory.

DESCRIPTION

This command creates Quick Timing Model (QTM) for the current design or the soft macro cells inside the current design. The QTMs are created based on the clock information provided in the given SDC files, and the delay information in the QTMs are based on the real delays in the design.

EXAMPLES

The following example creates QTM for current design, and the QTM file is written to directory *my_qtm_dir*.

```
prompt> generate_qtm_model -clock_definition clk.sdc -directory my_qtm_dir
```

The following command creates QTMs for soft macros A1 and A2 in current design.

```
prompt> generate_qtm_model -block {A1 A2} -  
clock_definition {A1 clk1.sdc A2 clk2.sdc}ffP
```

SEE ALSO

```
create_qtm_model(2)  
report_qtm_model(2)  
save_qtm_model(2)  
write_qtm_model(2)
```

get_adjusted_endpoints

Creates a collection of endpoints that have been adjusted in feasibility mode.

SYNTAX

```
status get_adjusted_endpoints
[-zero_path]
[-zero_wire_load]
[-io]
[-slack_threshold]
[-all]
[-scenarios scenarios]
```

Data Types

scenarios list

ARGUMENTS

-zero_path

This option returns only endpoints that have been adjusted for zero_path violations, where zero_path margins have been added to the endpoint required times.

-zero_wire_load

This option returns only endpoints that have been adjusted for zero_wire_load violations, where zero_wire_load margins have been added to the endpoint required times.

-io

This option returns only endpoints that have been adjusted due to I/O margins that were added to endpoint required times.

-slack_threshold

This option returns only endpoints that have been adjusted for slack_threshold, where slack threshold margins have been added to the endpoint required times.

-all

This option returns all adjusted endpoints irrespective of the reasons for adjustment.

-scenarios *scenarios*

This option returns only adjusted endpoints of the given scenarios. The default is to return only adjusted endpoints of the current scenarios.

DESCRIPTION

Feasibility mode enables constraint relaxation for unachievable endpoints for reporting commands and the **place_opt** command. During feasibility mode unachievable endpoints are identified and required time on the unachievable endpoints are relaxed

based on the unachievable timing portion. Endpoints with zero path violations and zero wire load violations are considered unachievable endpoints.

This command allows you to obtain in a collection the list of endpoints that have been adjusted for the given specific reasons and scenarios. The default is to return only the adjusted endpoints of the current scenario.

Multicorner-Multimode Support

By default, this command uses information from the current scenario. You can select different scenarios by using the **-scenarios** option.

EXAMPLES

The following examples show how to use the **get_adjusted_endpoints** command.

```
prompt> get_adjusted_endpoints -zero_path -scenarios s1
{Top/B_A/B/C1/a Top/B_A/C2/b Top/C_A/C2/b}

prompt> sizeof_collection \
[get_adjusted_endpoints -zero_path -scenario s1]
3
```

SEE ALSO

set_feasibility_options(2)
report_feasibility_options(2)
```

get_alternative_lib_cells

Creates a collection of equivalent library cells from loaded libraries, for a given cell or library cell. This collection can be used to replace or resize a specified cell in the current design. You can assign these library cells to a variable or pass them into another command.

SYNTAX

```
string get_alternative_lib_cells
[-quiet]
[-regexp [-nocase]]
[-exact]
[-filter expression]
[-library libraries]
pattern_or_objects
```

Data Types

<i>expression</i>	string
<i>libraries</i>	string
<i>pattern_or_objects</i>	string

ARGUMENTS

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the value of the *patterns_or_objects* argument as a real regular expression rather than as a simple wildcard pattern.

-nocase
Makes matches case-insensitive. You can use the **-nocase** option only when you also use the **-regexp** option.

-exact
Disables simple pattern matching. Use this option when searching for objects that contain the "*" (asterisk) wildcard as an actual character.

-filter *expression*
Filters the collection with the value of the *expression* argument. For library cells that match the specified patterns (or objects), the expression is evaluated based on the attributes of the library cells. If the expression evaluates to true, the library cell is included in the result. The **-regexp** and **-nocase** options are applied in the same way as in the **filter_collection** command. See the **filter_collection** man page for more information on how to use a **-filter** option in general.

-library *libraries*
Specifies a list of libraries from which to select equivalent library cells. The default is to select from all libraries in the link path. In this case,

lib_spec can be a list of library names or a collection of loaded libraries.

pattern_or_objects

Specifies cells or library cells for which a collection of equivalent library cells is required. Pattern matching is case sensitive unless you use the **-nocase** option. The default is * (asterisk).

DESCRIPTION

This command creates a collection of equivalent library cells from loaded libraries loaded for a given cell or library cell. The command returns a collection handle (identifier) if any library cells that are logically similar to the specified library cell match the *patterns_or_objects* option (if specified) and pass the filter (if specified). If no objects match the criteria, the command returns an empty string.

When the **-libraries** option is omitted, the command traverses the link path to find libraries. In this case, if a library is found with a min library relationship (which is determined from the setting in the **set_min_library** command), the min library is automatically included. When the **-libraries** option is used, the command considers only the libraries that are passed in.

If the command is unable to find any logically similar library cells for the library cell and the current design is not linked, the design automatically links.

Regular expression matching in the **get_alternative_lib_cells** command is the same as in the Tcl **regexp** command. When using **-regexp**, take care how you quote the *patterns_or_objects* option and filter expression. It is recommended that you use rigid quotation marks with curly braces around regular expressions.

Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding .* to the beginning or end of the expressions, as needed.

You can use the **get_alternative_lib_cells** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_alternative_lib_cells** result to a variable.

When issued from the command prompt, **get_alternative_lib_cells** behaves as if you had called **query_objects** to display the objects in the collection. By default, the command displays a maximum of 100 objects. You can change this maximum by using the **collection_result_display_limit** variable.

The "implicit query" property of **get_alternative_lib_cells** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the options of the **query_objects** command (for example, if you want to display the object class), use **get_alternative_lib_cells** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES for XG Mode

The following example shows that, given a standard library cell, you can query the equivalent library cells.

```
prompt> set libcelsel\
[get_lib_cells slow/AND2X2]
{"slow/AND2X2"}
prompt> query_objects \
[get_alternative_lib_cells $libcelsel]
{"slow/AND2X1", "slow/AND2X6", "slow/AND2X12"}
```

The following example shows that, given a cell, you can query the equivalent library cells that can be used in place of those cells.

```
prompt> set celsel [get_cell top/U21]
{"top/U21"}
prompt> query_objects \
[get_alternative_lib_cells $celsel]
{"slow/AND2X1", "slow/AND2X2", "slow/AND2X6", "slow/AND2X12"}
```

get_always_on_logic

Returns a collection of cells and nets on always-on paths in the design.

SYNTAX

```
collection get_always_on_logic
[-cells]
[-nets]
[-all]
```

ARGUMENTS

-cells	Returns the cells on always-on paths.
-nets	Returns the nets on always-on paths.
-all	Returns the nets and cells on always-on paths. This is the default when no argument is specified.

DESCRIPTION

This command creates a collection of nets and cells on always-on paths. Always-on paths are paths that must be powered up the entire time that the system is operating. These paths consist of logic cones that terminate on always-on pins in the design. Examples of always-on pins are the enable pin of the isolation cell and special control pins of retention registers.

You can mark any instance pin with an always-on attribute by using the **set_attribute** command. You can create power down regions by using the **create_power_domain** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

create_power_domain(2)
set_attribute(2)

get_attribute

Returns the value of an attribute on an object.

SYNTAX

```
string get_attribute
[-class class_name]
[-quiet]
object_spec
attribute_name
```

Data Types

<i>class_name</i>	string
<i>object_spec</i>	string
<i>attribute_name</i>	string

ARGUMENTS

-class *class_name*
Specifies the class name of the *object_spec* option, if *object_spec* is a name. Valid classes are **design**, **port**, **cell**, **net**, and so on. This option is required if *object_spec* is a name.

-quiet
Indicates that error and warning messages are not to be reported.

object_spec
Specifies a single object from which to get the attribute value. The *object_spec* must be either a collection consisting of one object or a name that is combined with the *class_name* to find the object. If *object_spec* is a name, you must also use the **-class** option.

attribute_name
Specifies the name of the attribute whose value is to be returned.

DESCRIPTION

This command returns the value of an attribute on an object. The object is either a collection of exactly one object or the name of an object. If it is a name, you must use the **-class** option. The return value is a string.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example shows that the first command defines an *X* attribute for cells:

```
prompt> define_user_attribute -type int -class cell X
Info:User-defined attribute 'X' on class 'cell'.
1
```

The following example sets the attribute to a value on all cells in this level of the hierarchy:

```
prompt> set_attribute [get_cells *] X 30
{"i1", "i2"}
```

The following example retrieves the value from one cell, combines it with the application attribute *full_name*, and creates a simple report:

```
prompt> foreach_in_collection sel [get_cells *] {\`
echo -n "On '[get_attribute $sel full_name]', "
echo "X = [get_attribute $sel X]"
}
On 'i1', X = 30
On 'i2', X = 30
```

SEE ALSO

```
collections(2)
define_user_attribute(2)
foreach_in_collection(2)
list_attributes(2)
remove_attribute(2)
set_attribute(2)
```

get_bounds

Creates a collection of bounds from the current design.

SYNTAX

```
collection get_bounds
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
objects
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-quiet
Suppresses warning and error messages, if no objects match. Does not suppress syntax error messages.

-regexp
Views the *patterns* argument as a real regular expression rather than a simple wildcard pattern. This option also modifies the behavior of the `=~` and `!~` filter operators to behave as regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive. If you use this option, you must also use the **-regexp** option.

-exact
Considers wildcards to be plain characters, and does not interpret their meaning as wildcards.

-filter *expression*
Filters the collection with *expression*. The expression is evaluated based on the bound's attributes for any bounds that match the *patterns* option. If the expression evaluates to **true**, the bound is included in the result.

patterns
Matches bound names against *patterns*. If you do not use this option, the command uses the asterisk (*) as the default pattern. The *patterns* and **-of_objects** options are mutually exclusive; you can use only one.

-of_objects *objects*
Creates a collection of bounds containing the specified objects. The *objects* list should be a list of leaf cells or ports. The *patterns* and **-of_objects**

options are mutually exclusive; you can use only one.

DESCRIPTION

This command creates a collection of bounds from the current design that match certain criteria. The command returns a collection handle (identifier) if any bounds match the *patterns* value and passes the filter, if specified. If no objects match the criteria, the command returns an empty string.

You can use this command at the command prompt, or you can nest it as an argument to another command (for example, to the **report_bound** command). In addition, you can assign the **get_bounds** result to a variable.

When issued from the command prompt, the **get_bounds** command behaves as though you have called the **report_bound** command to report the objects in the collection. By default, it displays a maximum of 100 objects. You can change this maximum by using the **collection_result_display_limit** variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples get all bounds that have a name starting with **my_bound**.

```
prompt> get_bounds my_bound*
```

SEE ALSO

```
collections(2)
foreach_in_collection(2)
query_objects(2)
collection_result_display_limit(3)
```

get_buffers

Creates a collection of buffer cells from the libraries loaded in memory.

SYNTAX

```
collection get_buffers
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-inverter]
[-inverting_buffers]
[-library lib_spec]

```

Data Types

<i>expression</i>	string
<i>lib_spec</i>	list
<i>patterns</i>	list

ARGUMENTS

-filter *expression*

Filters the collection with *expression*. For any buffer cells that match *patterns*, the expression is evaluated based on the buffer lib cell's attributes. If the expression evaluates to true, the buffer cell is included in the result. This option works the same as the **filter** command in dc_shell.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase

Makes matches case-insensitive.

-exact

Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters.

-inverter

This option specifies to get the inverter cells. By default only buffer cells will be returned. To include the library cells having both inverter and non-inverting outputs use -inverting_buffers option.

-inverting_buffers

This option specifies to include inverting buffer cells along with the

inverter cells or buffer cells. By default this is false and only buffer cells will be returned (only inverter cells when `-inverter` is specified). Inverting buffers are library cells which have both inverting and non-inverting outputs.

`-library lib_spec`

Specifies a list of libraries from which the buffer cells are to be collected. The default is to select from all libraries in the link path. In this case, `lib_spec` can be a list of library names, or collection of libraries loaded.

`patterns`

Matches buffer cell names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards refer to the **wildcards** man page.

DESCRIPTION

The **get_buffers** command creates a collection of buffer cells from libraries currently loaded into `dc_shell-xg-t` that match certain criteria. The command returns a collection handle (identifier) if any buffer cells match the *patterns* or *objects* and pass the filter (if specified). If no objects match the criteria, the empty string is returned.

Regular expression matching is the same as in the Tcl **regexp** command. When using `-regexp`, take care in the way you quote the *patterns* and *filter expression*. Using rigid quoting with curly braces around regular expressions is recommended. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding `".*"` to the beginning or end of the expressions as needed.

You can use the **get_buffers** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_buffers** result to a variable.

When issued from the command prompt, **get_buffers** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_buffers** provides a fast, simple way to display buffer cells in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_buffers** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries all buffer cells that are in the current library.

```
prompt> get_buffers
{"slow/BUF2X2", "slow/BUF2X4", "slow/BUF2X12"}
```

The following example queries all inverter cells that are in the misc_cmos library

```
prompt> get_buffers -inverter -library misc_cmos
{"misc_cmos/INV2X2", "misc_cmos/INV2X4", "misc_cmos/INVX12"}
```

SEE ALSO

```
collections(2)
filter_collection(2)
get_lib_cells(2)
query_objects(2)
collection_result_display_limit(3)
wildcards(3)
```

get_cell_sites

Creates a collection of cell sites from the current design.

SYNTAX

```
collection get_cell_sites
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]

```

Data Types

<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-quiet
Suppresses warning and error messages, if no objects match. Does not suppress syntax error messages.

-regexp
Views the patterns argument as a real regular expression rather than a simple wildcard pattern. This option also modifies the behavior of the `=~` and `!~` filter operators to behave as regular expressions rather than simple wildcard patterns.

-nocase
When combined with -regexp, this option makes matches case-insensitive. You can use -nocase only when you also use -regexp.

-exact
Disables all pattern matching.

-filter *expression*
Filters the collection with *expression*. For any cell site that matches the *patterns* argument, the expression is evaluated based on the cell site's attributes. If the expression evaluates to true, the cell site is included in the result.

patterns
Matches cell site names against the specified patterns. The patterns list can include the wildcard character `"*"`.

DESCRIPTION

The **get_cell_sites** command creates a collection of cell sites from the current design that matches certain criteria. The command returns a collection handle

(identifier) if any cell site matches the patterns and passes the filter (if specified). If no objects match the criteria, an empty string is returned.

You can use the **get_cell_sites** command at the command prompt, or you can nest it as an argument to another command (for example, **remove_cell_sites**). In addition, you can assign the **get_cell_sites** result to a variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets all the cell sites in the current design.

```
prompt> get_cell_sites
{CELL_SITE#3690}
```

SEE ALSO

`remove_cell_sites(2)`

get_cells

Creates a collection of cells that match certain criteria.

SYNTAX

```
collection get_cells
[-hierarchical]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
[patterns
 | -of_objects objects
 | -object_id object_id
 | -within region
 | -intersect region
 | -touching region
 | -at point]
[-all]
[-design_id design_id]
[-hsc separator]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>object_id</i>	integer
<i>region</i>	list
<i>point</i>	string
<i>design_id</i>	integer

ARGUMENTS

-hierarchical Searches for cells level-by-level, relative to the current instance. The full name of the object at a particular level must match the patterns. For example, if there is a cell block1/adder, a hierarchical search finds it by using "adder". By default, this option is off.

-quiet Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed. By default, this option is off.

-regexp Uses the *patterns* argument as real regular expressions rather than as simple wildcard patterns. By default, this option is off.

-nocase Makes the matches case-insensitive. By default, this option is off.

-exact

Disables simple pattern matching. Use this when searching for objects that contain the * (asterisk) wildcard character. By default, this option is off.

-filter expression

Filters the collection with the value of *expression*. For any cells that match the specified criteria, the expression is evaluated based on the cell's attributes. If the expression evaluates to true, the cell is included in the result. By default, this option is off.

patterns

Matches cell names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, see the **wildcards** man page. The *patterns*, **-of_objects**, **-object_id**, **-within**, **-intersect**, **-touching**, and **-at** arguments are mutually exclusive; you can specify only one. If you do not specify any of these arguments, the command uses * (asterisk) as the *pattern*.

-of_objects objects

Creates a collection of cells connected to the specified objects. Each object can be a pin, net, bound, voltage area, plan group, or pin shape. The *patterns*, **-of_objects**, **-object_id**, **-within**, **-intersect**, **-touching**, and **-at** arguments are mutually exclusive; you can specify only one. If you do not specify any of these arguments, the command uses * (asterisk) as the *pattern*. In addition, you cannot use the **-hierarchical** option with the **-of_objects** option.

-object_id object_id

Specifies the Milkyway object ID of the cell to include in the collection. To determine the *id* value, use the **get_attribute** command to return the value of the **object_id** attribute. The *patterns*, **-of_objects**, **-object_id**, **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one. If you do not specify any of these arguments, the command uses * (asterisk) as the *pattern*.

-within region

Creates a collection containing all cells within the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is {{llx lly} {urx ury}} or {llx, lly, urx, ury}, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: {{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}, and each {x y} pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: {{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron). The *patterns*, **-of_objects**, **-object_id**, **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one. If you do not specify any of these arguments, the command uses * (asterisk) as the *pattern*. In addition, you cannot use the **-hierarchical** option with the **-within** option.

-intersect region

Creates a collection containing all cells that intersect the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is {{llx lly} {urx ury}} or {llx, lly, urx, ury}, which specifies

the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: $\{\{x_1\ y_1\} \{x_2\ y_2\} \dots \{x_N\ y_N\} \{x_1\ y_1\}\}$, and each $\{x\ y\}$ pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: $\{\{\{x_1\ y_1\} \{x_2\ y_2\} \dots \{x_N\ y_N\} \{x_1\ y_1\}\}\}$. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron). The **patterns**, **-of_objects**, **-object_id**, **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one. If you do not specify any of these arguments, the command uses * (asterisk) as the pattern. In addition, you cannot use the **-hierarchical** option with the **-intersect** option.

-touching region

Creates a collection containing all cells that touch the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is $\{\{llx\ lly\} \{urx\ ury\}\}$ or $\{llx,\ lly,\ urx,\ ury\}$, which specifies the lower-left and upper-right corners of the rectangle.

The valid format of a polygon is: $\{\{x_1\ y_1\} \{x_2\ y_2\} \dots \{x_N\ y_N\} \{x_1\ y_1\}\}$, and each $\{x\ y\}$ pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: $\{\{\{x_1\ y_1\} \{x_2\ y_2\} \dots \{x_N\ y_N\} \{x_1\ y_1\}\}\}$. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.

The coordinate unit is specified in technology file (usually it is micron). The **patterns**, **-of_objects**, **-object_id**, **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one. If you do not specify any of these arguments, the command uses * (asterisk) as the pattern. In addition, you cannot use the **-hierarchical** option with the **-touching** option.

-at point

Creates a collection containing all cells at the specified point. The format of a point is $\{x\ y\}$. The coordinate unit is specified in technology file (usually it is micron).

The **patterns**, **-of_objects**, **-object_id**, **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one. If you do not specify any of these arguments, the command uses * (asterisk) as the pattern. In addition, you cannot use the **-hierarchical** option with the **-at** option.

-all

Includes physical-only cells in the collection. When a cell has one of the following types, it is physical-only:

Standard Filler
Pad Filler
Corner
Flip Chip Pad (Bump)
Chip
Cover
Tap
Cells containing only PG ports

By default, physical-only cells are not included in the collection.

-design_id design_id

Specifies the design from which to create the collection of cells. The design

is one of the currently open Milkyway designs (CELS). To determine the *id* value, use the **get_attribute** command to return the value of the **design_id** attribute. Use this option only when multiple Milkyway designs are open. By default, the command creates a collection of cells from the current design.

-hsc separator

Specifies the hierarchy separator character that is used for this command to create unambiguous names when an object name contains a slash (/). The valid values are / (slash), @ (at sign), ^ (caret), # (pound sign), . (period), and | (vertical bar). The default is /.

DESCRIPTION

This command creates a collection of cells that match certain criteria. By default, the command creates the collection of cells from the current design, relative to the current instance.

The command returns a collection of cells if any cells match *patterns*, *objects*, or *object_id* and pass the filter (if specified). If no objects match the criteria, an empty string is returned.

If *patterns*, *objects*, and *object_id* fail to match any objects and the current design is not linked, the design automatically links.

Regular expression matching is the same as in the Tcl **regexp** command.

When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*; use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_cells** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_cells** result to a variable.

When issued from the command prompt, **get_cells** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum by using the **collection_result_display_limit** variable.

The implicit query property of **get_cells** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_cells** as an argument to the **query_objects** command.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the cells that begin with *o* and references an FD2 library cell. Although the output looks like a list, it is only a display.

```
prompt> get_cells "o*" -filter "@ref_name == FD2"
{o_reg1 o_reg2 o_reg3 o_reg4}
```

The following example shows that, given a collection of pins, you can query the cells connected to those pins:

```
prompt> set pinsel [get_pins o*/CP]
{o_reg1/CP o_reg2/CP}

prompt> query_objects [get_cells -of_objects $pinsel]
{o_reg1 o_reg2}
```

The following example shows that, given a collection of nets, you can query the cells connected to those nets:

```
prompt> set netsel [get_nets tmp]
{tmp}

prompt> query_objects [get_cells -of_objects $netsel]
{b c}
```

The following example gets all cells within the specified rectangle:

```
prompt> get_cells -within {{62.101 91.301} {74.124 100.127}}
{STACK_BLK/C370/U30 STACK_BLK/U53}
```

The following example gets all cells that intersect the specified polygon:

```
prompt> get_cells \
-intersect {{30 20} {50 20} {50 30} {40 30} {40 40} {30 40} {30 20}}
{STACK_BLK/MEM_reg_9__0_ STACK_BLK/MEM_reg_1__0_}
```

SEE ALSO

```
collections(2)
filter_collection(2)
get_pins(2)
query_objects(2)
win_select_objects(2)
get_net_shapes(2)
collection_result_display_limit(3)
wildcards(3)
```

get_clocks

Creates a collection of clocks from the current design.

SYNTAX

```
collection get_clocks
[-quiet]
[-regexp]
[-nocase]
[-filter expression]

```

Data Types

<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Views the *patterns* argument as real regular expressions rather than simple wildcard patterns. Also, modifies the behavior of the `=~` and `!~` filter operators to compare with real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive when combined with **-regexp**. Use **-nocase** only when you use **-regexp**.

-filter *expression*
Filters the collection with *expression*. For any clocks that match *patterns*, the expression is evaluated based on the clock's attributes. If the expression evaluates to true, the clock is included in the result. This option works the same as the **filter** command in dc_shell.

patterns
Matches clock names against patterns. Patterns can include the * (asterisk) and ? (question mark) wildcard characters. For more details about using and escaping wildcards refer to the **wildcards** man page.

DESCRIPTION

The **get_clocks** command creates a collection of clocks in the current design that match certain criteria. The command returns a collection handle (identifier) if any clocks match the *patterns* and pass the filter (if specified). If no objects match the criteria, the empty string is returned.

You can use the **get_clocks** command at the command prompt, or you can nest it as an argument to another command (for example, **query_objects**). In addition, you can assign the **get_clocks** result to a variable.

When issued from the command prompt, **get_clocks** behaves as though the **query_objects** command has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The "implicit query" property of **get_clocks** provides a fast, simple way to display clocks in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_clocks** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example applies the **set_max_time_borrow** command to all clocks in the design matching *PHI**:

```
prompt> set_max_time_borrow 0 [get_clocks "PHI*"]
```

The following example sets the **clock_list** variable to a collection of clocks that have a period of 15:

```
prompt> set clock_list [get_clocks * -filter "@period==15"]
```

SEE ALSO

all_clocks(2)
collections(2)
create_clock(2)
query_objects(2)
report_clock(2)
wildcards(3)
collection_result_display_limit(3)

get_command_option_values

Queries current/default option values.

SYNTAX

```
get_command_option_values
[-default | -current]
-command command_name
```

ARGUMENTS

```
-default
    get default option values if available

-current
    get current option values if available

-command command_name
    get option values for this command
```

DESCRIPTION

This command attempts to query a default or current value for each option (of the command) which has default and/or current-value-tracking enabled. Details of how the option value is queried depend on whether one of the optional options *-current* or *-default* is specified (see below).

A "Tcl array set compatible" (possibly empty) list of option names and values will be returned as the Tcl result - the even numbered entries in the list are the names of options which were enabled for default-value-tracking or current-value-tracking enabled (and had at least one of these values set to a not-undefined value); each odd numbered entry in the list is the default or current value of the option-name preceding it in the list. Any options which were enabled for neither default-value-tracking nor current-value-tracking will be omitted from the output list; similarly options which were enabled for default-value-tracking or current-value-tracking, but for which no (not-undefined) default or current value is set, will be omitted from the result list.

If neither *-current* nor *-default* is specified, then the default behavior is: for each command option which has either default-value-tracking or current-value-tracking (or both) enabled, the value returned is: the current value is returned if current-value-tracking is enabled and a (not-undefined) current value has been set; otherwise the default value is returned if default-value-tracking is enabled and a (not-undefined) default value has been set; otherwise the name/value pair for the option is not included in the result list.

If *-current* is specified, the value returned for an option is the current value if current-value-tracking is enabled, and a (not-undefined) current value has been set; otherwise the name/value pair for the option is omitted from the result list.

If *-default* is specified, the value returned for an option is the default value if

default-value-tracking is enabled, and a (not-undefined) default value has been set; otherwise the name/value pair for the option is omitted from the result list.

The result list from `get_command_option_values` includes option values of both dash options and positional options (assuming that both kinds of options of a command have been enabled for value-tracking).

The command will "throw" a Tcl error in a variety of situations, such as if an invalid command name was passed in via `-command`.

EXAMPLES

```
prompt> foo -bar1 10 -bar2 20
1
prompt> get_command_option_values -command foo
-bar1 10 -bar2 20
```

SEE ALSO

get_core_area

Creates a collection containing the core area of the current design.

SYNTAX

```
collection get_core_area
```

ARGUMENTS

This command has no arguments.

DESCRIPTION

This command returns a collection containing the core area of the current design. If the core area is not defined, the command returns an empty string.

The core area is a box that contains all rows. It represents the placeable area for standard cells. The core area is typically smaller than the cell boundary. Pads, I/O pins, and top-level power and ground rings are typically found outside the core area. Standard cells, macros, and wire tracks are typically found inside the core area. There should be only one core area in a design.

The core_area object is a first class object, and it has multiple attributes, such as bbox, cell_id, name and so on. You can use **list_attributes** and **report_attribute** to browse attributes. You can use **get_attribute** and **lindex** to get coordinates of the current design die area.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets the core area of the current design.

```
prompt> get_core_area
{unit_core}
```

The following example shows how to list the attributes of the core_area class by using **list_attributes** command.

```
prompt> list_attributes -application -class core_area
```

The following example shows how to get the attribute values of the core_area object by using **report_attribute** command.

```
prompt> report_attribute -application -class core_area [get_core_area]
```

The following example shows how to get coordinates of the current design die area, by using **get_attribute** command.

```
prompt> get_attribute [get_core_area] bbox
{0.000 0.000} {300.480 396.620}
```

SEE ALSO

[get_die_area\(2\)](#)
[get_attribute\(2\)](#)
[list_attributes\(2\)](#)

get_coupling_capacitors

Reports coupling capacitors for the given net.

SYNTAX

```
int get_coupling_capacitors
[-min]
net
```

ARGUMENTS

```
-min
      Reports coupling capacitors for the given net for min.

net
      Reports coupling capacitors for the given net.
```

DESCRIPTION

Reports coupling capacitances for each individual aggressor. For each coupling the information is given in the format {victim:subnode_number (victim_net_name) aggressor:subnode_number (aggressor_net_name) CC_value type_of_filter}

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example produces detailed coupling capacitances for the net n9589.

```
prompt> get_coupling_capacitors n9589

{n9589:7 (n9589) n8661:7 (n8661) 6.59743e-
05 not_filtered} {n9589:7 (n9589) n8661:8 (n8661) 6.59743e-05 not_filtered}
```

SEE ALSO

`report_noise(2)`

get_cts_scenario

Returns the name of the clock tree synthesis scenario or the empty string if a clock tree synthesis scenario is not defined.

SYNTAX

```
string get_cts_scenario
```

ARGUMENTS

The **get_cts_scenario** command has no arguments.

DESCRIPTION

This command returns the name of the clock tree synthesis scenario or the empty string if a clock tree synthesis scenario is not defined.

Multicorner-Multimode Support

This command uses information from the clock tree synthesis scenario.

EXAMPLES

The following example uses **get_cts_scenario** to get the clock tree synthesis scenario.

```
prompt> create_scenario MODE1
prompt> set_cts_scenario MODE1
MODE1
prompt> get_cts_scenario
MODE1
```

SEE ALSO

```
remove_cts_scenario(2)
set_cts_scenario(2)
```

get_design_lib_path

Returns the directory to which the specified library is mapped.

SYNTAX

```
status get_design_lib_path
library_name
```

Data Types

library_name string

ARGUMENTS

library_name
Specifies the library whose directory mapping is returned.

DESCRIPTION

This command returns the directory to which the specified library is mapped.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example maps the library named MY_LIB to the same directory as the WORK library.

```
prompt> define_design_lib MY_LIB\
-path get_design_lib_path("WORK")
```

SEE ALSO

`read_file(2)`
`report_design_lib(2)`

get_designs

Creates a collection of one or more designs loaded into the tool.

SYNTAX

```
collection get_designs
[-hierarchical]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]

```

Data Types

<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-hierarchical
Searches for designs inferred by the design hierarchy relative to the current instance. The full name of the object at a particular level must match the patterns. The use of this option does not force an auto link.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters.

-filter *expression*
Filters the collection with *expression*. For any designs that match *patterns*, the expression is evaluated based on the design's attributes. If the expression evaluates to true, the design is included in the result.

patterns
Matches design names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards refer to the **wildcards** man page.

DESCRIPTION

The **get_designs** command creates a collection of designs from those currently loaded into the tool that match certain criteria. The command returns a collection if any designs match the *patterns* and pass the filter (if specified). If no objects match your criteria, the empty string is returned.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*. Using rigid quoting with curly braces around regular expressions is recommended. Regular expressions are always anchored. The expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_designs** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_designs** result to a variable.

When issued from the command prompt, **get_designs** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_designs** provides a fast, simple way to display designs in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_designs** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the designs that begin with "mpu". Although the output looks like a list, it is just a display. A complete listing of designs is available using the **list_designs** command.

```
prompt> get_designs mpu*
{mpu_0_0 mpu_0_1 mpu_1_0 mpu_1_1}
```

The following example shows that, given a collection of designs, you can remove those designs:

```
prompt> remove_design [get_designs mpu*]
Removing design mpu_0_0...
Removing design mpu_0_1...
```

```
Removing design mpu_1_0...
Removing design mpu_1_1...
```

SEE ALSO

```
collections(2)
filter_collection(2)
list_designs(2)
query_objects(2)
remove_design(2)
collection_result_display_limit(3)
wildcards(3)
```

get_die_area

Creates a collection containing the die area of the current design.

SYNTAX

```
collection get_die_area
```

ARGUMENTS

This command has no arguments.

DESCRIPTION

This command returns a collection containing the die area of the current design. If the die area is not defined, the command returns an empty string.

The die area is also known as the cell boundary. It represents the silicon boundary of a chip and typically encloses all objects of a design, such as pads, I/O pins, cells, and so on. There should be only one die area in a design.

The die area object is a first class object that has multiple attributes, such as bbox, cell_id, name, and so on. You can use the **list_attributes** and **report_attribute** commands to browse attributes. You can use the **get_attribute** command and **lindex** to get coordinates of the current design die area.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets the die area of the current design.

```
prompt> get_die_area
{top_die}
```

The following example shows how to use the **list_attributes** command to list the attributes of the die_area class.

```
prompt> list_attributes -application -class die_area
```

The following example shows how to use the **report_attribute** command to get the attribute values of the die_area object.

```
prompt> report_attribute -application\
-class die_area [get_die_area]
```

The following example shows how to use the **get_attribute** command to get coordinates of the current design die area.

```
prompt> get_attribute [get_die_area] bbox
{0.000 0.000} {300.480 396.620}
```

SEE ALSO

[get_attribute\(2\)](#)
[get_core_area\(2\)](#)
[list_attributes\(2\)](#)

get_dominant_scenarios

Returns a list of dominant scenarios.

SYNTAX

```
list get_dominant_scenarios
[-scenarios scenario_list]
[-distributed]
[-setup_distributed]
[-run_distributed]
[-process_distributed]
```

Data Types

scenario_list list

ARGUMENTS

-scenarios *scenario_list*

Lists scenarios, which might be active or inactive, to analyze. By default, the command analyzes all active scenarios.

-distributed

Specifies for analysis to be done in distributed mode. You must use the **set_mcmm_job_options** and/or **set_host_options** commands to set various parameters necessary for distributed operation, such as the host list or compute farm.

-setup_distributed

Generates the necessary directories, data files, and scripts for a distributed-mode run; however, it does not actually start any slave jobs, and does not do actual dominant-scenario analysis. You must use the **set_mcmm_job_options** command to set various parameters necessary to do this, such as the working directory.

-run_distributed

Executes a set of distributed analysis jobs previously set up by specifying the **-setup_distributed** option; however, it does not do actual dominant-scenario analysis. You must use the **set_mcmm_job_options** command to set various parameters necessary to do this, such as the working directory.

-process_distributed

Performs dominant-scenario analysis based on the results of a previous distributed-mode run. You must use the **set_mcmm_job_options** command to set various parameters, such as the working directory. You can use the **-process_distributed** option with the **-run_distributed** option to re-run and re-analyze a previously-created distributed-mode run.

DESCRIPTION

This command identifies a set of essential or dominant scenarios. These are a subset

of the user-defined scenarios that are considered essential for concurrent multicorner, multimode optimization of a design. These scenarios have the worst slack (timing, DRC, and so on) for at least one of the constrained objects in the design (that is, an end-point for delay constraints or a net for DRC constraints).

If any of these scenarios is not active during optimization, the final optimized design's quality of results (QoR) might degrade when measured across all user-defined scenarios. The analysis is based on the current state of the design in terms of its current placement, routing, and clock-tree state.

You can use the **get_dominant_scenarios** command in conjunction with the **set_active_scenario** command to direct the tool's concurrent multi-scenario optimization to work on a subset of scenarios. This can improve the memory and run-time capacity of concurrent multi-scenario optimization.

Get_dominant_scenarios will run in multi-CPU mode if the maximum number of processing threads has been set by the **-max_cores** option of the **set_host_options** command. On multi-core or multi-CPU machines, activating threaded operation can greatly reduce runtime.

If the **-distributed** option is given, **get_dominant_scenarios** will run in distributed mode. You must use the **set_mcmm_job_options** and/or **set_host_options** commands to set various parameters necessary for distributed operation, such as the host list or compute farm.

Multicorner-Multimode Support

This command uses information from both active and inactive scenarios. This command also uses information from the clock tree synthesis scenario.

EXAMPLES

The following example uses the command to identify the dominant (or essential) subset of scenarios and sets them to be active prior to optimization.

```
prompt> create_scenario scene1
prompt> read_sdc scene1.sdc
prompt> create_scenario scene2
prompt> read_sdc scene2.sdc
prompt> # Create more scenarios and read their SDC...
prompt> create_scenario scene8
prompt> read_sdc scene8.sdc
prompt> set_active_scenarios [get_dominant_scenarios]
prompt> all_active_scenarios
prompt> psynopt -area_recovery -power
```

SEE ALSO

all_active_scenarios(2)
all_scenarios(2)
create_scenario(2)
current_scenario(2)

get_dominant_scenarios

```
remove_scenario(2)
set_active_scenarios(2)
set_mcmm_job_options(2)
set_host_options(2)
```

get_drc_errors

Return a collection of errors matching given criteria.

SYNTAX

```
status get_drc_errors
[-error_view mw_error_view]
[-error_id error_id]
[-type error_type]
[-bbox area]
[-quiet]
[-nocase]
[-exact]
[-regexp]
[-filter expression]
```

Data Types

<i>mw_error_view</i>	list or collection
<i>error_id</i>	list
<i>error_type</i>	list or collection

ARGUMENTS

-error_view <i>mw_error_view</i>	The error view from which to query error objects. If omitted, the top-level design cell is used. Specifying more than one error view causes an error.
-error_id <i>error_id</i>	Return errors with matching error ids.
-type <i>error_type</i>	Return errors of given type.
-bbox <i>area</i>	Return errors in the given area.

DESCRIPTION

This command returns errors matching the given criteria in a collection.

EXAMPLES

The following example queries all errors of type "Short" from the current top-level design:

```
prompt> set errors [get_drc_errors -type "Short"]
{1280 1281 1282 1283 1284 1285 1286}
```

SEE ALSO

`create_drc_error(2)`
`create_drc_error_type(2)`
`list_drc_error_types(2)`
`report_drc_error_type(2)`

get_edit_groups

Gets a collection of edit groups.

SYNTAX

```
collection get_edit_groups
[-filter expression]
[-of_objects collection]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-object_id string]
[-design_id string]
[patterns]
```

ARGUMENTS

-filter *expression*

Filters the collection with the specified expression. For any edit groups that match the specified patterns or objects, the expression is evaluated based on the edit groups' attributes. If the result of the expression evaluation is true, the edit group is included in the result. This option works in the same way as the filter command.

-of_objects *collection*

Gets edit groups of these objects.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the patterns argument as a real regular expression instead of using simple wildcard patterns.

-nocase

Makes the matches case-insensitive.

-exact

Disables simple pattern matching. Use this option when searching for objects that contain the wildcard character.

-object_id *string*

Specifies the object ID of one edit group.

-design_id *string*

Specifies the design ID to look in instead of the current design.

patterns

Match edit group names against patterns. The default pattern is *.

DESCRIPTION

The command gets a collection of edit groups based on the options specified.

EXAMPLES

The following example gets all edit groups in the design

```
prompt> set gr [get_edit_groups]
```

The following example gets edit groups matching regular expression

```
prompt> set gr [get_edit_groups -regexp "[Pp].*"]
```

SEE ALSO

`create_edit_group(2)`

get_error_view_property

Return error view property value.

SYNTAX

```
string get_error_view_property
-writer
| -version
| -ignore_type_name_property
| -run_set
| -areas
| -excluded_areas
| -command
[-error_view mw_error_view]
```

Data Types

mw_error_view list or collection

ARGUMENTS

```
-writer
    Get the "Writer" property. This is the product name of the error view writer.

-version
    Get the "Version" property. This is the product version of the error view
    writer.

-ignore_type_name_property
    Get the "IgnoreTypeNameProperty" property. If this property is true, then the
    TypeName property of error type is ignored. This TypeName property is used
    to store type names that are longer than can be stored in the regular schema.
    If value is false, "IgnoreTypeNameProperty" property may be deleted.

-run_set
    Get the "Runset" property. This is the name of the runset file input to the
    DRC check.

-areas
    Get the "Areas" property. These are the areas of the design that were included
    in the DRC check.

-excluded_areas
    Get the "ExcludedAreas" property. These are the areas of the design that were
    excluded from the DRC check.

-command
    Get the "Command" property. This is the command string which invoked the DRC
    or LVS check which produced the error view.

-error_view mw_error_view
    The error view from which to query the property values. If omitted, the
```

properties are queried from the current top-level design cell. Specifying more than one error view causes an error.

DESCRIPTION

This command returns an error view property value.

SEE ALSO

`set_error_view_property(2)`

get_flat_cells

Creates a collection of leaf cells that match certain criteria in the current design.

SYNTAX

```
collection get_flat_cells
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
objects
  | -object_id object_id
[-all]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>object_id</i>	integer

ARGUMENTS

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as real regular expressions rather than as simple wildcard patterns.

-nocase
Makes the matches case-insensitive.

-exact
Disables simple pattern matching. Use this when searching for objects that contain the * (asterisk) wildcard character.

-filter *expression*
Filters the collection with the value of *expression*. For any cells that match the specified criteria, the expression is evaluated based on the cell's attributes. If the expression evaluates to true, the cell is included in the result.

patterns
Matches cell full names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, see the **wildcards** man page. The *patterns*, **-of_objects**, and **-object_id** options are mutually exclusive; you can choose

only one.

-of_objects *objects*

Creates a collection of cells connected to the specified objects. In this case, each object is a named cell, pin, net, bound, voltage area, plan group, power domain or a collection of these objects. The *patterns*, **-of_objects**, and **-object_id** options are mutually exclusive; you can choose only one.

-object_id *object_id*

Specifies the Milkyway object ID of the leaf cell to include in the collection. To determine the *id* value, use the **get_attribute** command to return the value of the **object_id** attribute. The *patterns*, **-of_objects**, and **-object_id** options are mutually exclusive; you can specify only one.

-all

Includes physical-only cells in the collection.

When a cell has one of the following types, it is physical-only:

Standard Filler

Pad Filler

Corner

Flip Chip Pad (Bump)

Chip

Cover

Tap

Cells containing only PG ports

DESCRIPTION

This command creates a collection of leaf cells that match certain criteria in the current design. Leaf cells are those processed during placement and route. They are shown and can be selected in GUI Layout window.

The command returns a collection of cells if any cell matches *patterns*, *objects*, or *object_id* and pass the filter (if specified). If no objects match the criteria, an empty string is returned.

When using *patterns*, the command searches all leaf cells to match *patterns* on full name regardless of their hierarchical level.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns* and filter expression; use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_flat_cells** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects** and **change_selection**. In addition, you can assign the **get_flat_cells** result to a variable.

When issued from the command prompt, **get_flat_cells** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum by using the

`collection_result_display_limit` variable.

The implicit query property of **get_flat_cells** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_flat_cells** as an argument to the **query_objects** command.

For information about collections and the querying of objects, see the **collections** man page.

get_flat_cells and **get_cells** returns the same type database objects. The collections returned by both commands are interchangeable and can be passed along to any command that accept cell objects.

get_flat_cells differs from **get_cells** in several ways. **get_cells** performs the pattern search based on the logical hierarchy of the design and are consistent with the commands used for synthesis and timing analysis that have been in Design Compiler, Primetime, and SDC. **get_flat_cells** searches all leaf cells to match patterns on full name relative to the current design, it does not depend on the current instance. It provides pattern search in the way that is consistent with the place-and-route view of the design, and thus is simpler for many tasks through ICC flow. The user is free to use whichever command is easier for them depending on the type of search they are doing. **get_flat_cells** is not part of the SDC format standard and should not be used in timing constraint scripts if the user wants to apply them across other tools, or using read_sdc.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries all soft macro cells in the current design. Although the output looks like a list, it is only a display.

```
prompt> get_flat_cells * -filter {is_soft_macro==true}
{I_ORCA_TOP/I_BLENDER_1 I_ORCA_TOP/I_BLENDER_2 I_ORCA_TOP/I_BLENDER_3 I_ORCA_TOP/
I_BLENDER_4 I_ORCA_TOP/I_BLENDER_5}
```

The following example queries the leaf cells whose full name begins with *BLOCK/*, equivalently all leaf cells any number of logical levels below the hierarchical cell *BLOCK*.

```
prompt> get_flat_cells BLOCK/*
{BLOCK/SB/U1 BLOCK/SB/U2 BLOCK/SB/U3 BLOCK/SB/U4 BLOCK/U5 BLOCK/U6 BLOCK/U7 BLOCK/
U8 BLOCK/U9}
```

As a comparison to the above example, the following example finds only cells that are direct children of the hierarchical cell *BLOCK*.

```
prompt> get_cells BLOCK/*
{BLOCK/SB BLOCK/U9 BLOCK/U5 BLOCK/U8 BLOCK/U7 BLOCK/U6}
```

The following example shows that, given a collection of nets, you can select the leaf cells connected to those nets. You can see that these cells are selected in GUI Layout View if there is one opens for the current design.

```
prompt> set netsel [get_flat_nets r1_2_]
{r1_2_}
prompt> change_selection [get_flat_cells -of_object $netsel]
```

SEE ALSO

get_flat_pins(2)
get_flat_nets(2)
query_objects(2)
change_selection(2)
collection_result_display_limit(3)
wildcards(3)
```

get_flat_nets

Creates a collection of top nets of hierarchical net groups and meet the specified criteria in the current design.

SYNTAX

```
collection get_flat_nets
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
objects
  | -object_id object_id
[-all]
```

Data Types

<i>patterns</i>	list
<i>objects</i>	list
<i>object_id</i>	integer

ARGUMENTS

-filter *expression*
Filters the collection with *expression*. For any nets that match the specified criteria, the expression is evaluated based on the net's attributes. If the expression evaluates to true, the net is included in the result.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters.

patterns
Matches full names of top nets of hierarchical net groups against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards refer to the **wildcards** man page. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one.

-of_objects *objects*
Creates a collection of top nets of hierarchical net groups that are connected to the specified objects. Each object is either a named pin, port, terminal, net, cell, shape, via, or a collection of these objects. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one.

-object_id *object_id*
Specifies the Milkyway object ID of the net to include in the collection. To determine the *id* value, use the **get_attribute** command to return the value of the **object_id** attribute. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one.

-all
Includes power and ground nets.

DESCRIPTION

The **get_flat_nets** command creates a collection of top nets of hierarchical net groups in the current design.

The command returns a collection if any nets match *patterns*, *objects*, or *object_id* and pass the filter (if specified). If no objects matched the criteria, the empty string is returned.

When using *patterns*, the command searches all top nets of hierarchical net groups to match *patterns* on full name.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*. Use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_flat_nets** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects** and **change_selection**. In addition, you can assign the **get_flat_nets** result to a variable.

When issued from the command prompt, **get_flat_nets** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_flat_nets** provides a fast, simple way to display nets in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_flat_nets** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

get_flat_nets and **get_nets** returns the same type database objects. The collections returned by both commands are interchangeable and can be passed along to any command

that accept net objects.

get_flat_nets differs from **get_nets** in several ways. **get_nets** performs the pattern search based on the logical hierarchy of the design and are consistent with the commands used for synthesis and timing analysis that have been in Design Compiler, Primetime, and SDC. **get_flat_nets** searches top nets of hierarchical net groups to match *patterns* on full name relative to the current design, it does not depend on the current instance. It provides pattern search in the way that is consistent with the place-and-route view of the design, and thus is simpler for many tasks through ICC flow. The user is free to use whichever command is easier for them depending on the type of search they are doing. **get_flat_nets** is not part of the SDC format standard and should not be used in timing constraint scripts if the user wants to apply them across other tools, or using `read_sdc`.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the top nets whose full name begins with *BLOCK/*. Although the output looks like a list, it is just a display.

```
prompt> get_flat_nets BLOCK/*
{BLOCK/SB/n76}
```

The following example shows that there is no top net whose full name begins with *BLOCK/* and ends with *n1*.

```
prompt> get_flat_nets BLOCK/*n1
Warning: No nets matched 'BLOCK/*n1' (SEL-004)
```

As a comparison to the above example, the following example shows that there is a net whose full name begins with *BLOCK/* and ends with *n1*.

```
prompt> get_nets BLOCK/*n1
{BLOCK/n1}
```

The following selects top nets of hierarchy net groups that connect to cells, you can see that these nets are selected in GUI Layout View if there is one open for the current design:

```
prompt> set cellsel [get_flat_cells I_ORCA_TOP/I_SDRAM_IF/U23276]
{I_ORCA_TOP/I_SDRAM_IF/U23276}

prompt> change_selection [get_flat_nets -of_object $cellsel]
```

`query_objects(2)`
`collection_result_display_limit(3)`
`wildcards(3)`

get_flat_pins

Creates a collection of pins of leaf cells that match the specified criteria in the current design.

SYNTAX

```
collection get_flat_pins
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
objects
  | -object_id object_id
[-all]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>object_id</i>	integer

ARGUMENTS

-filter *expression*
Filters the collection with *expression*. For any pins that match the specified criteria, the expression is evaluated based on the pin's attributes. If the expression evaluates to true, the pin is included in the result.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters.

patterns
Matches leaf cell pin full names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, refer to the **wildcards** man page. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one.

```

-of_objects objects
    Creates a collection of leaf cell pins connected to the specified objects.
    Each object is a named leaf cell or net or a collection of these objects. The
    patterns, -of_objects, and -object_id arguments are mutually exclusive; you
    can specify only one. In addition, you cannot use -hierarchical with -
of_objects.

-object_id object_id
    Specifies the Milkyway object ID of the leaf cell pin to include in the
    collection. To determine the id value, use the get_attribute command to
    return the value of the object_id attribute. The patterns, -of_objects, and
    -object_id arguments are mutually exclusive; you can specify only one.

-all
    Includes power and ground pins.

```

DESCRIPTION

The **get_flat_pins** command creates a collection of pins of leaf cells that match certain criteria in the current design. Leaf cells are those processed during placement and route. They are shown and can be selected in GUI Layout window.

The command returns a collection if any pins match the *patterns*, *objects*, or *object_id* and pass the filter (if specified). If no objects match the criteria, the empty string is returned.

When using *patterns*, the command searches all pins of leaf cells to match *patterns* on full name regardless of their hierarchical level.

When used with **-of_objects**, **get_flat_pins** searches for pins connected to any leaf cells or nets specified in *objects*.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*. Use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can expand the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_flat_pins** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects** and **change_selection**. In addition, you can assign the **get_flat_pins** result to a variable.

When issued from the command prompt, **get_flat_pins** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_flat_pins** provides a fast, simple way to display pins in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_flat_pins** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections**

man page.

get_flat_pins and **get_pins** returns the same type database objects. The collections returned by both commands are interchangeable and can be passed along to any command that accept pin objects.

get_flat_pins differs from **get_pins** in several ways. **get_pins** performs the pattern search based on the logical hierarchy of the design and are consistent with the commands used for synthesis and timing analysis that have been in Design Compiler, Primetime, and SDC. **get_flat_pins** searches all pins of leaf cells to match *patterns* on full name relative to the current design, it does not depend on the current instance. It provides pattern search in the way that is consistent with the place-and-route view of the design, and thus is simpler for many tasks through ICC flow. The user is free to use whichever command is easier for them depending on the type of search they are doing. **get_flat_pins** is not part of the SDC format standard and should not be used in timing constraint scripts if the user wants to apply them across other tools, or using `read_sdc`.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the *I* pins of leaf cells that begin with *I_CLK*. Although the output looks like a list, it is just a display.

```
prompt> get_flat_pins I_CLK*/I
{I_CLK_SOURCE_SDRAM_CLK/I I_CLK_SOURCE_SYS_2x_CLK/I I_CLK_SOURCE_SYS_CLK/
I I_CLK_SOURCE_PCLK/I}
```

The following example queries *ZN* pins of all leaf cells any number of logical levels below the hierarchical cell *BLOCK*.

```
prompt> get_flat_pins BLOCK/*/ZN
{BLOCK/SB/U1/ZN BLOCK/SB/U2/ZN BLOCK/SB/U3/ZN BLOCK/SB/U4/ZN BLOCK/U5/ZN BLOCK/U6/
ZN BLOCK/U7/ZN BLOCK/U8/ZN BLOCK/U9/ZN}
```

As a comparison to the above example, the following example finds *ZN* pins of cells that are direct children of the hierarchical cell *BLOCK*.

```
prompt> get_pins BLOCK/*/ZN
{BLOCK/U9/ZN BLOCK/U5/ZN BLOCK/U8/ZN BLOCK/U7/ZN BLOCK/U6/ZN}
```

The following example selects pins of leaf cells whose name begin with *O_1* you can see that these pins are selected in GUI Layout View if there is one opens for the current design:

```
prompt> set csel [get_flat_pins O_1*]
```

```
{0_10__reg 0_11__reg 0_12__reg 0_13__reg 0_1__reg}  
prompt> change_selection [get_flat_pins -of_objects $csel]
```

SEE ALSO

```
collections(2)  
filter_collection(2)  
get_pins(2)  
get_flat_cells(2)

wildcards(3)
```

get_floorplan_data

Returns the value of the specified floorplan data attribute on the specified module.

SYNTAX

```
string get_floorplan_data
-module module_object
[-view one_level | logical | physical]
[-quiet]
attribute_name
```

Data Types

<i>module_object</i>	collection
<i>attribute_name</i>	string

ARGUMENTS

```
-module module_object
    Specifies a single module object from which to get the floorplan attribute
    value. This is a required option.
    The module_object must be a collection consisting of one object.
    Valid objects are the current Milkyway design, hierarchical cells, soft
    macros, hard macros, and plan groups.

-view one_level | logical | physical
    Specifies the view in which the attribute value is calculated.
    When you specify one_level (the default), the attribute value is calculated
    by traversing only one level of hierarchy in the specified module.
    When you specify logical or physical, the attribute value is calculated by
    traversing through all levels of hierarchy in the specified module. The
    difference between logical and physical is that soft macros are traversed in
    the physical view, but not in the logical view.
    This option is ignored if you specify a plan group (plan groups have only a
    logical view).

-quiet
    Suppresses all output messages from the execution of this command.
```

DESCRIPTION

This command returns the value of a floorplan data attribute on the specified module and view.

The return value is a string.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns the value of the **number_of_standard_cell** floorplan data attribute on all hierarchical cells in the current design, and combines it with the **full_name** application attribute to create a simple report.

```
prompt> foreach_in_collection sel \
    [get_cells * -filter {is_hierarchical == true}] {echo -
n "On '[get_attribute $sel full_name]', "
echo "number_of_standard_cell = [get_floorplan_data -
module $sel number_of_standard_cell -view one_level]"
}
On 'I_CLOCK_GEN', number_of_standard_cell = 10
On 'I_RESET_BLOCK', number_of_standard_cell = 15
On 'I_ORCA_TOP', number_of_standard_cell = 127
```

SEE ALSO

```
collections(2)
foreach_in_collection(2)
list_floorplan_data(2)
floorplan_data_attributes(3)
```

get_fp_trace_mode

Determines whether a design is in trace mode.

SYNTAX

```
int get_fp_trace_mode
```

EXAMPLE

```
prompt> get_fp_trace_mode
Design is not in trace mode
0
```

```
prompt> set_fp_trace_mode
```

```
:  
:
```

```
prompt> get_fp_trace_mode
Design is in trace mode
1
```

```
prompt> set_fp_trace_mode -end
```

```
:  
:
```

```
prompt> get_fp_trace_mode
Design is not in trace mode
0
```

SEE ALSO

```
set_fp_trace_mode(2)  
get_fp_trace_mode(2)
```

get_fp_wirelength

Calculates the virtual route wirelength as a minimum length needed to connect all pins.

SYNTAX

```
status get_fp_wirelength
[-specified_nets object_list
 | -internal_nets
 | -interface_nets]
```

Data Types

object_list list

ARGUMENTS

-specified_nets *object_list*

Reports specified nets. Use this option if you want to estimate the wirelength on only the specified nets. The **-specified_nets**, **-internal_nets**, and **-interface_nets** are mutually exclusive; use only one.

-internal_nets

Reports only internal nets. This option shows the wirelength of internal nets for all plan groups. All of the pins of international nets are inside plan groups. If you use this option and the command does not find a plan group in the design, no processing is done. The **-specified_nets**, **-internal_nets**, and **-interface_nets** are mutually exclusive; use only one.

-interface_nets

Reports only interface nets. This option shows the wirelength of interface nets for all plan groups. Interface nets have at least 1 pin inside the plan group and 1 pin outside the plan group. If you use this option and the command does not find a plan group in the design, no processing is done. The **-specified_nets**, **-internal_nets**, and **-interface_nets** are mutually exclusive; use only one.

DESCRIPTION

This command calculates the virtual route wirelength as a minimum length needed to connect all pins. You can use it to evaluate overall placement quality. The command produces vertical, horizontal, and total wirelength statistics for top-level signal nets in the design.

It uses pin locations to calculate the minimum length of nets, with no layer-based information and no consideration of congestion. If a top-level port does not have a pin, the command issues a warning and skips the corresponding net. If a port inside the child cell does not have a pin, the command issues a warning and uses the coordinates of the center of the corresponding cell instance instead of the coordinates of the missing pin.

If you use the command without any options, it processes all nets in the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example processes all nets in a sample design.

```
prompt> get_fp_wirelength

INFO: Checking variables ...
INFO: Checking variables completed.
INFO: Initialization ...
INFO: Initialization completed.

Total Virtual Wire Length: 1425316.9060

Elapsed = 0:00:01, CPU = 0:00:00
```

SEE ALSO

[place_fp_pins\(2\)](#)

get_generated_clocks

Creates a collection of generated clocks.

SYNTAX

```
collection get_generated_clocks
[-quiet]
[-regexp]
[-nocase]
[-filter expression]
[-exact]

```

Data Types

<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed. This option is available only in XG mode.

-regexp
Views the *patterns* argument as real regular expressions rather than simple wildcard patterns. Also modifies the behavior of the =~ and !~ filter operators to compare with real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive when combined with **-regexp**.
Use **-nocase** only when you also use **-regexp**.

-filter *expression*
Filters the collection with *expression*. For any generated clocks that match *patterns* the expression is evaluated based on the generated clock's attributes. If the expression evaluates to true, the generated clock is included in the result.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters.
The **-exact** and **-regexp** options are mutually exclusive.

patterns
Matches generated clock names against *patterns*. Patterns can include the * (asterisk) and ? (question mark) wildcard characters.

DESCRIPTION

The **get_generated_clocks** command creates from the current design a collection of generated clocks that match certain criteria. The command returns a collection handle (identifier) if any generated clocks match the *patterns* and pass the filter (if specified). If no objects match the criteria, the empty string is returned.

To create a generated clock in the design, use the **create_generated_clock** command. To remove a generated clock from the design, use the **remove_generated_clock** command. To show information about clocks and generated clocks in the design, use the **report_clock** command.

Use the **get_generated_clocks** command at the command prompt or nest it as an argument to another command, such as **query_objects**. You can also assign the **get_generated_clocks** result to a variable.

When issued from the command prompt, **get_generated_clocks** behaves as though **query_objects** had been called to display the objects in the collection. By default a maximum of 100 objects is displayed. Change this maximum using the **collection_result_display_limit** variable.

The "implicit query" property of **get_generated_clocks** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the **query_objects** options, such as if you want to display the object class, use **get_generated_clocks** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following command applies the **set_clock_latency** command on all generated clocks in the design matching *GEN**:

```
prompt> set_clock_latency 2.0 [get_generated_clocks "GEN*"]
```

The following command removes all the generated clocks in the design matching *GEN1**:

```
prompt> remove_generated_clock [get_generated_clocks "GEN1*"]
```

SEE ALSO

collections(2)
create_generated_clock(2)
query_objects(2)
remove_generated_clock(2)
report_clock(2)
collection_result_display_limit(3)

get_ilm_objects

Returns a collection of nets, cells, or pins that are part of the interface logic models for the current design.

SYNTAX

```
collection get_ilm_objects
[-type net | pin | cell]
```

ARGUMENTS

-type net | pin | cell

Specifies the type of object to be returned as a collection of objects. Valid values are **net**, **pin**, or **cell**. The command returns a collection of objects of the specified type that belong to the interface logic models on the current design.

DESCRIPTION

This command returns a collection of nets, cells, or pins that have been identified as belonging to interface logic models by using the **create_ilm** command. The **get_ilm_objects** command takes into consideration that the Interface Logic Model (ILM) preserves the hierarchy of the original design. Hence the collection contains nets, pins, and cells of all levels of hierarchy. You can use the command to review the objects that have been identified as belonging to the interface logic models on the current design.

For a discussion of ILM creation and the associated commands, see the **create_ilm** command man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection of all interface logic cells.

```
prompt> get_ilm_objects -type cell
```

The following example returns a collection of all interface logic nets.

```
prompt> get_ilm_objects -type net
```

The following example returns a collection of all interface logic pins.

```
prompt> get_ilm_objects -type pin
```

SEE ALSO

`create_ilm(2)`

get_ilms

Creates a collection of interface logic models (ILMs) defined in the current design.

SYNTAX

```
collection get_ilms
[-quiet]
[-reference]
[-filter expression]

```

Data Types

<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-quiet

Suppresses warning and error messages if no objects match. It does not suppress syntax error messages. The default is to show warning and error messages.

-reference

Returns reference cells for the ILM blocks. The default is to return the instances.

-filter *expression*

Filters the collection with the *expression* value. For any ILMs that match the *patterns* value, the expression is evaluated based on the attributes of the ILM. If the expression evaluates to **true**, the ILM is included in the result. By default, the collection is not filtered.

patterns

Matches the placement keepout names against the *patterns* list. The *patterns* list can include the * (asterisk) wildcard character.

DESCRIPTION

This command creates a collection of ILM cells/blocks from the current design that match certain criteria. It returns a collection handle (identifier) if any ILMs match a *patterns* list value and pass the filter (if specified). If no objects match the criteria, the command returns an empty string.

You can use this command at the command prompt, or you can nest it as an argument to another command. You can also assign the **get_ilms** result to a variable.

When you issue the **get_ilms** command from the command prompt, by default, the display shows a maximum number of **100** objects. You can use the **collection_result_display_limit** variable to change the maximum number.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples get all ILMs that have a name starting with my_ilm.

```
prompt> get_ilms my_ilm*
```

The following examples get all reference of ILM blocks that have a name starting with JE.

```
prompt> get_ilms -reference JE*
{JE1 JE2}
```

The following example queries the ilms that begin with je and references a JE1 library cell.

```
prompt> get_ilms "je*" -filter "@ref_name == JE1"
{je1_sm}
```

The following example shows that given a collection of ILM cell instance, you can query the pins connected to those cells:

```
prompt> get_pins -of_objects [get_ilms je1_sm]
{je1_sm/je1_mod_in2ff1_in je1_sm/clk je1_sm/je1_ff4_out2mod_out}
```

SEE ALSO

```
collections(2)
foreach_in_collection(2)
query_objects(2)
report_design(2)
collection_result_display_limit(3)
```

get_layer_attribute

Queries layer attribute.

SYNTAX

```
string get_layer_attribute
[-quiet]
[-layer layer]
[attribute]
```

ARGUMENTS

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-layer *layer*

Specify the layer to query attributes. The layer could be specified by a collection or by layer name.

attribute

Specify which attribute to query. The name of the attributes can be queried by: prompt>list_attributes -application -class layer

DESCRIPTION

This command retrieves the attribute value of certain layer. The return value is a Tcl string.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the layer number.

```
> get_layer_attribute -layer M1 layer_number
3
```

SEE ALSO

`get_layers(2)`
`get_attribute(2)`

get_layers

Creates a collection of one or more layers.

SYNTAX

```
collection get_layers
[-filter expression]
[-quiet]
[-regexp [-nocase]] | [-exact]
[-include_system]
[patterns]
[-exact]
```

Data Types

patterns string

ARGUMENTS

-filter *expression*

Filters the collection with the value of *expression*. For any layers that match, the expression is evaluated based on the layer's attributes. If the expression evaluates to true, the layer is included in the result.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Views the *patterns* option as real regular expressions rather than simple wildcard patterns. This option modifies the behavior of the =~ and !~ filter operators to compare with real regular expressions rather than with simple wildcard patterns. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-nocase

Makes matches case-insensitive. You can use this option only when you also use the **-regexp** option.

-include_system

Includes the system layers in the collection. Without this option, only user layers that are defined in the technology file can be included in the collection. Layer numbers from 1 to 187 are for user layers, and the layer numbers greater than 187 are for system layers.

patterns

Matches layer names against *patterns*. Patterns can include the wildcard characters * (asterisk) and ? (question mark) or regular expressions, depending on whether or not you also use the **-regexp** option.

-exact

Disables simple pattern matching. You can use this option when searching for

objects that contain the * (asterisk) and ? (question mark) wildcard characters. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

DESCRIPTION

This command creates a collection of layers defined in the technology file for the current library, or a collection that also contains system layers if you use the **-include_system** option.

You can use the **get_layers** command at the command prompt or as an argument nested in another command (for example, in the **query_objects** command). You can also assign its result to a variable.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a layer for the name M1R.

```
prompt> get_layers M1R
{M1R}
```

The following example returns layers for routing.

```
prompt> get_layers -filter is_routing_layer==TRUE
{METAL5 METAL METAL2 METAL3 METAL4 M6 M7 M8 PA}
```

SEE ALSO

```
collections(2)
filter_collection(2)
get_layer_attribute(2)
query_objects(2)
```

get_lib_attribute

Returns the value of an attribute on a list of library objects.

SYNTAX

```
list get_lib_attribute
object_list
attribute_name
```

Data Types

<i>object_list</i>	list
<i>attribute_name</i>	string

ARGUMENTS

<i>object_list</i>	Lists the library objects for which the attribute value is to be returned.
<i>attribute_name</i>	Specifies the name of the attribute whose value is to be returned.

DESCRIPTION

This command searches *object_list* for the specified attribute and returns a list of attribute values. If the attribute is not found on any of the specified objects, the command returns an empty list.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows how to find the cell named INV and obtain its area value.

```
prompt> get_lib_attribute sample/INV area
Performing get_lib_attribute on library object
'sample/INV'.
{1.0}
```

The following example shows an error issued because the the command does not find a cell named INV1.

```
prompt> get_attribute sample/INV1 area
Error: The 'INV1' object does not exist in the 'sample' technology library. (UIL-54)
```

```
{}
```

The following example shows the lib_udg_attr value returned for the user-defined group named lib_udg1 in the library named sample.

```
prompt> get_lib_attribute\
sample/lib_udg1 lib_udg_attr
Performing get_lib_attribute on library object 'sample/lib_udg1'.
{Test}
```

The following example shows the area values returned for gates named G1 and G2 in the library named tech_lib.

```
prompt> get_lib_attribute
{sample/G1, sample/G2} area
Performing get_lib_attribute on library object 'sample/G1'.
Performing get_lib_attribute on library object 'sample/G2'.
{1.0, 2.0}
```

SEE ALSO

`set_lib_attribute(2)`

get_lib_cells

Creates a collection of library cells from the libraries loaded into memory.

SYNTAX

```
collection get_lib_cells
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-scenario scenario_name]
[patterns]
[-of_objects objects]
```

Data Types

<i>expression</i>	string
<i>scenario_name</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-filter *expression*

Filters the collection with *expression*. For any library cells that match *patterns*, the expression is evaluated based on the library cell's attributes. If the expression evaluates to true, the library cell is included in the result.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase

Makes matches case-insensitive.

-exact

Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters.

-scenario *scenario_name*

Creates a collection of library cells that belong to the libraries which are used in the specified scenario. The result will be based on the following options: pattern, -exact, -nocase, and -regexp.

patterns

Matches library cell names against patterns. Patterns can include the

wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards refer to the **wildcards** man page.

-of_objects objects

Creates a collection of library cells that are referenced by the specified cells or own the specified library pins. In this case, each object is either a named library pin, netlist cell, library pin collection, or a netlist cell collection. The **-of_objects** and *patterns* arguments are mutually exclusive. You must specify one, but not both.

DESCRIPTION

The **get_lib_cells** command creates a collection of library cells from libraries currently loaded into memory that match certain criteria. If no objects match the criteria, the empty string is returned.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*. Using rigid quoting with curly braces around regular expressions is recommended. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_lib_cells** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_lib_cells** result to a variable.

When issued from the command prompt, **get_lib_cells** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_lib_cells** provides a fast, simple way to display library cells in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_lib_cells** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

By default, this command uses information from all active scenarios. You can select different scenarios by using the **-scenario** option.

EXAMPLES

The following example queries all library cells that are in the misc_cmos library and begin with "AN2". Although the output looks like a list, it is just a display.

```
prompt> get_lib_cells misc_cmos/AN2*
{misc_cmos/AN2 misc_cmos/AN2P}
```

The following example shows one way to determine the library cell used by a particular cell instance:

```
prompt> get_lib_cells -of_objects [get_cells o_reg1]
{misc_cmos/FD2}
```

SEE ALSO

`collections(2)`
`filter_collection(2)`
`get_cells(2)`
`query_objects(2)`
`collection_result_display_limit(3)`
`wildcards(3)`

get_lib_pins

Creates a collection of library cell pins from libraries loaded into memory.

SYNTAX

```
collection get_lib_pins
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
objects
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-filter *expression*
Filters the collection with *expression*. For any library cell pins that match *patterns*, the expression is evaluated based on the library cell pin's attributes. If the expression evaluates to true, the lib_pin is included in the result.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters.

patterns
Matches library cell pin names against *patterns*. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards refer to the **wildcards** man page.

-of_objects *objects*
Creates a collection of library cell pins referenced by the specified netlist pins or owned by the specified library cells. In this case, each object is either a named library cell, netlist pin, library cell collection, or a netlist pin collection. The **-of_objects** and *patterns* arguments are mutually

exclusive; you must specify one, but not both.

DESCRIPTION

The **get_lib_pins** command creates a collection of library cell pins from the libraries currently loaded into memory that match certain criteria. If no objects matched the criteria, the empty string is returned.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*. Using rigid quoting with curly braces around regular expressions is recommended. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_lib_pins** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_lib_pins** result to a variable.

When issued from the command prompt, **get_lib_pins** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_lib_pins** provides a fast, simple way to display library cell pins in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_lib_pins** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command uses information from all active scenarios.

EXAMPLES

The following example queries all pins of the AN2 library cell in the misc_cmos library. Although the output looks like a list, it is just a display.

```
prompt> get_lib_pins misc_cmos/AN2/*
{misc_cmos/AN2/A misc_cmos/AN2/B misc_cmos/AN2/Z}
```

The following example shows one way to find out how the library pin is used by a particular pin in the netlist:

```
prompt> get_lib_pins -of_objects o_reg1/Q
{misc_cmos/FD2/Q}
```

SEE ALSO

`collections(2)`
`filter_collection(2)`
`get_libs(2)`
`get_lib_cells(2)`
`query_objects(2)`
`collection_result_display_limit(3)`
`wildcards(3)`

get_libs

Creates a collection of libraries loaded into memory.

SYNTAX

```
collection get_libs
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-scenario scenario_name]
[-of_objects objects]
[patterns]
```

Data Types

<i>expression</i>	string
<i>objects</i>	list
<i>patterns</i>	list

ARGUMENTS

-filter *expression*

Filters the collection with *expression*. For any libraries that match *patterns*, or *objects*, the expression is evaluated based on the library's attributes. If the expression evaluates to true, the library is included in the result.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Views the *patterns* argument as real regular expressions rather than simple wildcard patterns. Also, this option modifies the behavior of the =~ and !~ filter operators to compare with real regular expressions rather than simple wildcard patterns.

The **-regexp** and **-exact** options are mutually exclusive.

-nocase

Makes matches case-insensitive when used with **-regexp**. You must use this option with the **-regexp** option.

-exact

Disables simple pattern matching. This option is used when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters.

The **-exact** and **-regexp** options are mutually exclusive.

-scenario *scenario_name*

Creates a collection of libraries that are used in the specified scenario.

The result is based on the following options: *pattern*|*fP*, **-exact**, **-nocase**, and **-regexp**.

-of_objects *objects*

Creates a collection of libraries that contain the specified objects. Each object is either a named library cell or a library cell collection. The **-of_objects** and *patterns* arguments are mutually exclusive; you must specify one, but not both.

patterns

Matches library names against patterns. Patterns can include the * (asterisk) and ? (question mark) wildcard characters, based on the **-regexp** option. For more details about using and escaping wildcard characters refer to the **wildcards** man page.

The *patterns* and **-of_objects** arguments are mutually exclusive; you must specify one, but not both.

DESCRIPTION

The **get_libs** command creates a collection of libraries from those currently loaded into memory that match certain criteria. The command returns a collection handle or identifier if any libraries match the *patterns* and pass the filter, if specified. If no objects match the criteria, the empty string is returned.

When using the **-regexp** option, use care in the way you quote the *patterns* and filter expression. It is best to use rigid quoting with curly braces around regular expressions.

Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can expand the search by adding .* (dot asterisk) to the beginning or end of the expressions.

You can use the **get_libs** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. You can also assign the **get_libs** result to a variable.

When issued from the command prompt, **get_libs** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The "implicit query" property of **get_libs** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_libs** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

By default, this command uses information from all active scenarios. You can select

different scenarios by using the **-scenario** option.

EXAMPLES

The following example queries all loaded libraries. Use the **list_libraries** command to get a complete listing of the libraries.

```
prompt> get_libs *
{"misc_cmos", "misc_cmos_io"}
```

The following example removes a library collection. You cannot remove libraries if they are referenced by a design.

```
prompt> remove_lib [get_libs misc*]
Removing library misc_cmos...
Removing library misc_cmos_io...
```

SEE ALSO

[filter_collection\(2\)](#)
[query_objects\(2\)](#)
[collection_result_display_limit\(3\)](#)
[wildcards\(3\)](#)

get_license

Obtains a license for a feature.

SYNTAX

```
status get_license
feature_list
```

Data Types

```
feature_list      list
```

ARGUMENTS

```
feature_list
    Specifies a list of features to be obtained. If more than one feature is
    specified, they must be enclosed in braces ({}).
    By looking at your key file, you can determine all of the features licensed
    at your site.
```

DESCRIPTION

Obtains a license for the named features. These features are checked out by the current user until the **remove_license** command is used or until the program is exited.

The **list_licenses** command provides a list of the features that you are currently using.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example obtains the multivoltage feature:

```
prompt> get_license {Galaxy-MV}
```

SEE ALSO

```
check_license(2)
license_users(2)
list_licenses(2)
remove_license(2)
```

get_location

Gets the location of the specified objects.

SYNTAX

```
list get_location
object_list
[-rp_group rp_group]
```

Data Types

<i>object_list</i>	list
<i>rp_group</i>	string

ARGUMENTS

object_list
Lists objects whose location is to be returned.

-rp_group rp_group
Specifies the relative placement group within which to get the lattice position location.

DESCRIPTION

This command returns a list containing the x and y location of the objects specified. The input objects can be cells, ports, pins, or, when the **-rp_group** option is used, RP groups. The x and y values are absolute values. It means they are specified with respect to (0,0).

When getting the location of an RP group within another RP group the command can obtain multiple locations when the RP group is hierarchically instantiated multiple times. In such a case, the returned list of positions contains a sublist giving each of the locations for that RP group.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows how **get_location** can be used to get the location of an object

```
prompt> set cell_location\
[get_location [get_cell U11]]
prompt> set x_loc [lindex $cell_location 0]
prompt> set y_loc [lindex $cell_location 1]
```

```
prompt> set cell_rp_location\  
[get_location\  
[get_cell U11]\\  
-rp_group my_group]  
prompt> set x_rp_loc [lindex $cell_rp_location 0]  
prompt> set y_rp_loc [lindex $cell_rp_location 1]
```

SEE ALSO

[all_rp_groups\(2\)](#)
[get_cells\(2\)](#)
[get_ports\(2\)](#)

get_magnet_cells

Returns a collection of cells that can be pulled closer to magnet cells. Magnet cells can be specified as an argument to this command.

SYNTAX

```
collection get_magnet_cells
[-stop_by_sequential_cells]
[-exclude_buffers]
[-logical_level level]
[-stop_points object_list]
magnet_objects
```

Data Types

<i>level</i>	integer
<i>object_list</i>	collection
<i>magnet_objects</i>	collection

ARGUMENTS

-stop_by_sequential_cells

Specifies for the magnetizing of cells to stop when a sequential cell is encountered during the traversal of levels. By default, all the cells in the logical levels specified by the *magnet_objects* argument are magnetized by this command.

-exclude_buffers

Prevents consideration of buffers and inverters when calculating the level. They will be pulled like normal cells but will be skipped over for level determination. By default, buffers and inverters are considered to be one level of logic.

-logical_level level

Specifies the number of logical levels to magnetize. By default, the level value is 1, which means that only the first level cells are magnetized. The **-logical_level** and **-stop_points** options are mutually exclusive; you can use only one.

-stop_points object_list

Identifies the cells that lie on a timing path between the objects specified in *magnet_objects* and those that are specified in the *object_list*. These objects can be named in a list of any pin, port, or cell objects. The **-logical_level** and **-stop_points** options are mutually exclusive; you can use only one.

magnet_objects

Specifies the objects to become magnets. Any objects can be a fixed macro cell, a pin of a fixed macro cell, or an I/O pin. Vias, blockages, and IO pads are not allowed to be magnets.

DESCRIPTION

This command allows you obtain a collection of cells that are affected by magnet placement. You can use the returned collection to create bounds before running the **create_placement** command. You can also use it to highlight cells affected by magnet placement in the GUI.

If there are a large number of high fanout nets, magnet placement might pull a large number of cells resulting in long run-time. In order to avoid such cases, you can set the **magnet_placement_fanout_limit** environment variable to some reasonable value. Its default value is 1000.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets a collection of cells that are affected by magnet placement on a cell named INST_1.

```
prompt> get_magnet_cells [get_cells "INST_1"]
```

The following example obtains a collection of cells that would get pulled when performing magnet placement on a cell named INST_2. Two levels of cells are pulled and buffers, if any exist, are skipped over.

```
prompt> get_magnet_cells\  
-exclude_buffers [get_cells "INST_2"]
```

SEE ALSO

```
create_placement(2)  
legalize_placement(2)  
magnet_placement(2)  
set_cell_location(2)  
set_dont_touch_placement(2)
```

get_message_info

Returns information about diagnostic messages.

SYNTAX

```
Integer get_message_info
[-error_count | -warning_count | -info_count |
-limit l_id
| -occurrences o_id
| -suppressed s_id]
```

Data Types

<i>l_id</i>	string
<i>o_id</i>	string
<i>s_id</i>	string

ARGUMENTS

-error_count	Information returned is the number of error messages issued so far.
-warning_count	Information returned is the number of warning messages issued so far.
-info_count	Information returned is the number of informational messages issued so far.
-limit <i>l_id</i>	Information returned is the current user-specified limit for a given message id. The limit was set with set_message_info .
-occurrences <i>o_id</i>	Information returned is the number of occurrences of a given message id.
-suppressed <i>s_id</i>	Information returned is the number of times a message was suppressed by usage of suppress_message or due to exceeding a user-specified limit.

DESCRIPTION

The **get_message_info** command retrieves information about error, warning, and informational messages. For example, if the following message is generated, information about it is recorded.

Error: unknown command 'wrong_command' (CMD-005)

It is useful to be able to retrieve recorded information about generated diagnostic messages. For example, you can stop a script after a certain number of errors have occurred, or monitor the number of messages issued by a single command. For an example that shows using **get_message_info** in a procedure, see the EXAMPLES section. You can also find out how many times a specific message has occurred, or how many times it has been suppressed. Also, you can find out if a limit has been set for a

particular message id.

EXAMPLES

The following example uses **get_message_info** to count the number of errors that occurred during execution of a specific command, and to return from the procedure if the error count exceeds a given amount.

```
prompt> proc
do_command {limit} {      set current_errors [get_message_info -error_count]
    command
    set new_errors [get_message_info -error_count]
    if {[expr $new_errors - $current_errors] > $limit} {      return -
code error "Too many errors"
}
...
}
```

SEE ALSO

`set_message_info(2)`
`print_message_info(2)`
`suppress_message(2)`

get_mw_cels

Creates a collection of one or more Milkyway designs.

SYNTAX

```
collection get_mw_cels
[-hierarchical]
[-quiet]
[-regexp [-nocase]] | [-exact]
[-filter expression]

```

Data Types

<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-hierarchical
Searches for Milkyway designs inferred by the design hierarchy relative to the current instance. The full name of the object at a particular level must match the patterns. This option does not force an auto link.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Views the *patterns* argument as real regular expressions rather than simple wildcard patterns. This option modifies the behavior of the `=~` and `!~` filter operators to compare with real regular expressions rather than simple wildcard patterns. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-nocase
Makes matches case-insensitive. You can use this option only when you also use the **-regexp** option.

-filter *expression*
Filters the collection with the value of *expression*. For any Milkyway designs that match, the expression is evaluated based on the Milkyway design's attributes. If the expression evaluates to **true**, the Milkyway design is included in the result.

patterns
Matches Milkyway design names against patterns. Patterns can include the wildcard characters `*` (asterisk) and `?` (question mark) or regular expressions, based on the **-regexp** option. Patterns can also include collections of Milkyway celtype.

-exact
Disables simple pattern matching. You can use this when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

DESCRIPTION

This command creates a collection of Milkyway designs from those currently loaded into the tool that match certain criteria. It returns a collection if any Milkyway designs match the *patterns* value and pass the filter (if specified). If no objects match the criteria, the command returns an empty string.

Regular expression matching is the same as for the Tcl **regexp** command. When using the **-regexp** option, take care in the way you quote the *patterns* and filter expression options. Using rigid quoting with curly braces around regular expressions is recommended. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding *.** to the beginning or end of the expressions as needed.

You can use the **get_mw_cels** command at the command prompt, or you can use it as an argument nested in another command (for example, in the **query_objects** command), or you can assign its result to a variable.

When issued from the command prompt, the **get_mw_cels** command behaves as though the **query_objects** command has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed; you can change this maximum by using the **collection_result_display_limit** variable.

The "implicit query" property of the **get_mw_cels** command provides a fast, simple way to display Milkyway designs in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use the **get_mw_cels** command as an argument to the **query_objects** command.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries mw_cels that begin with *mpu*. Although the output looks like a list, it is just a display. You can use the **list_mw_cels** command to see a complete list of Milkyway designs.

```
prompt> get_mw_cels mpu*
{"mpu_0_0", "mpu_0_1", "mpu_1_0", "mpu_1_1"}
```

The following example shows that, given a collection of Milkyway designs, you can remove those Milkyway designs.

```
prompt> remove_mw_cel [get_mw_cels mpu*]  
Removing mw_cel mpu_0_0...  
Removing mw_cel mpu_0_1...  
Removing mw_cel mpu_1_0...  
Removing mw_cel mpu_1_1...
```

SEE ALSO

```

```

get_net_shapes

Creates a collection by selecting net shapes from the current design.

SYNTAX

```
collection get_net_shapes
[-within region
 | -intersect region
 | -touching region
 | -at point]
[-filter expression]
[-quiet]
[-type {vw | hw | path}]
[patterns | -of_objects net_list]
```

Data Types

<i>region</i>	list
<i>point</i>	string
<i>expression</i>	string
<i>patterns</i>	list
<i>net_list</i>	list

ARGUMENTS

-within *region*

Creates a collection containing all net shapes within the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{ {x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-intersect *region*

Creates a collection containing all net shapes intersect the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{ {x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-touching region
Creates a collection containing all net shapes touching the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{ {x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-at point
Creates a collection containing all net shapes that overlap the point specified by the coordinates `{x y}`. The coordinate unit is specified in technology file (usually it is micron). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-filter expression
Filters the collection with the value of `expression`, which must be a Boolean expression based on bound attributes. You can determine the net shape attributes by using the **list_attributes** command. If the expression evaluates to **true**, the net shape is included in the collection. By default, this option is off.

-quiet
Suppresses the reporting of non-terminal (warning and informational) messages.

-type {vw | hw | path}
Specifies the type of net shape, where **vw** is for vertical wire, **hw** is for horizontal wire, and **path** is the actual path. By default, this option is off.

patterns
Matches the net shape names against the patterns in the current design. You can specify the patterns by using the following formats:

- * (asterisk) allows all net shapes.
- HWIRE#* allows all horizontal wire net shapes.
- HWIRE# *object_id* allows all horizontal wires with a specified object ID.
- VWIRE#* allows all vertical wire net shapes.
- VWIRE# *object_id* allows all vertical wires with a specified object ID.
The **patterns** and **-of_objects** options are mutually exclusive. If you do not specify either the **patterns** and **-of_objects** options, the command defaults to using "*" as the pattern. By default, this option is off.

-of_objects net_list
Creates a collection containing the net shapes connected to the specified nets. The **patterns** and **-of_objects** options are mutually exclusive. If you do

not specify either the *patterns* and *-of_objects* options, the command defaults to using "*" as the pattern. By default, this option is off.

DESCRIPTION

This command creates a collection of net shapes by selecting net shapes from the current design that meet the selection criteria. It returns a collection handle if one or more net shapes meet the selection criteria. If no net shapes match the selection criteria, it returns an empty string.

You can use the **get_net_shapes** command at the command prompt, use it as an argument nested in another command, or assign its result to a variable.

See the **collections** command man page for information about working with collections.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example get all net shapes within specified rectangle.

```
prompt> get_net_shapes * -within {{4 20} {15 30}}
{"HWIRE#7264", "VWIRE#6766"}
```

The following example gets net shapes intersect specified polygon:

```
prompt>get_net_shapes -intersect \
{{30 20} {50 20} {50 30} {40 30} {40 40} {30 40} {30 20}}
{HWIRE#39936}
```

The following example creates a net shape collection.

```
prompt> get_net_shapes -of_objects n300 \
-intersect {{4 20} {15 30}}
{"VWIRE#6766"}
```

The following example creates a net shape collection.

```
prompt> get_net_shapes -filter {route_type=="P/G Std. Cell Pin Conn"}
{PATH#1134336 PATH#1134337 PATH#1134338 PATH#1134339 PATH#1134340}
```

get_net_shapes
842

get_nets

Creates a collection of nets that meet the specified criteria.

SYNTAX

```
collection get_nets
[-hierarchical]
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-top_net_of_hierarchical_group]
[-segments]
[-boundary_type boundary_type]
objects
  | -object_id object_id
[-all]
[-design_id design_id]
```

Data Types

<i>expression</i>	string
<i>boundary_type</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>object_id</i>	integer
<i>design_id</i>	integer

ARGUMENTS

-hierarchical
Searches for nets level-by-level relative to the current instance. The full name of the object at a particular level must match the patterns. For example, if there is a net named block1/muxsel, a hierarchical search finds it using muxsel. You cannot use the **-hierarchical** option with the **-of_objects** option.

-filter *expression*
Filters the collection with the value of the *expression* argument. For any nets that match the specified criteria, the expression is evaluated based on the net's attributes. If the expression evaluates to true, the net is included in the result.

-quiet
Suppresses messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the value of the *patterns* option as real regular expressions rather than as simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. You can use this when searching for objects that contain the * and ? wildcard characters.

-top_net_of_hierarchical_group
Keeps only the top net of a hierarchical group. When more than one hierarchical net of the same group is specified (local nets at various hierarchical levels of the same physical net), only the net closest to the top of the hierarchy is saved with the collection. In the case of multiple nets at the same level, the first net specified is kept. This option is best used in combination with the **-segments** option and with a single net.

-segments
Returns all global segments for given nets. This modifies the initial search that matches *patterns* or *objects*. It is applied after filtering, but before the **-top_net_of_hierarchical_group** is determined. For each net, all global segments that are part of that net are added to the resulting collection. Global net segments are all those physically connected across all hierarchical boundaries. This option is best used with a single net. When you use the **-segments** option with the **-top_net_of_hierarchical_group** option, you can isolate the highest net segment of a physical net.

-boundary_type boundary_type
Specifies what to do when getting nets of boundary pins. This option requires that you also use the **-of_objects** option. The valid values for the *boundary_type* argument are **lower**, **upper**, and **both**. The **lower** value specifies the net inside the hierarchical block. The **upper** value specifies the net outside the hierarchical block. The **both** value specifies both nets. The option has no meaning for non-hierarchical pins.
Note that **upper** is less useful than the other values because getting pins of a hierarchical net returns the pin outside the hierarchical block, and a subsequent execution of the **get_nets** command would get the upper hierarchical net. Using **upper** on a hierarchical pin is the same as entirely omitting the option.

patterns
Matches net names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, see the **wildcards** man page. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can use only one.

-of_objects objects
Creates a collection of nets connected to the specified objects. Each object is either a named pin, port, cell, shape, via, pin_guide, physical_bus, pin collection, port collection, cell collection, shape collection, via collection, pin_guide collection or physical_bus collection. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one. You cannot use the **-hierarchical** option with the **-of_objects** option.

-object_id object_id
Specifies the Milkyway object ID of the net to include in the collection. To

determine the *id* value, use the **get_attribute** command to return the value of the **object_id** attribute. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can use only one.

-all

Includes power and ground nets.

-design_id *design_id*

Specifies the Milkyway design ID of the design from which to create the collection of nets. The design is one of the currently open Milkyway designs (CELS). To determine the *id* value, use the **get_attribute** command to return the value of the **design_id** attribute. Use this option only when multiple Milkyway designs are open. If you do not use the **-design_id** option, the command creates a collection of cells from the current design.

DESCRIPTION

This command creates a collection of nets in the current design or in the design specified by the **-design_id** option (if you use it) relative to the current instance that match certain criteria. The command returns a collection if any nets match *patterns*, *objects*, or *object_id* and pass the filter (if specified). If no objects matched the criteria, the command returns an empty string.

If *patterns*, *objects*, and *object_id* fail to match any objects and the current design is not linked, the design automatically links.

Regular expression matching is the same as in the Tcl **regexp** command. When using **get_nets -regexp**, take care in how you quote the *patterns* and **-filter** options. Use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding the characters *.** to the beginning or end of the expressions, as needed.

You can use the **get_nets** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. You can also assign the **get_nets** result to a variable.

When issued from the command prompt, **get_nets** behaves as though **query_objects** has been called to display the objects in the collection. By default, the command displays a maximum of 100 objects. You can change this maximum by using the **collection_result_display_limit** variable.

The implicit query property of **get_nets** provides a fast, simple way to display nets in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use the **get_nets** command as an argument of the **query_objects** command.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the nets that begin with NET in a block named block1. Although the output looks like a list, it is a display.

```
prompt> get_nets block1/NET*
{"block1/NET1QNX", "block1/NET2QNX"}
```

The following example shows that with a collection of pins, you can query the nets connected to those pins.

```
prompt> current_instance block1
block1
prompt> set pinsel [get_pins {o_reg1/QN o_reg2/QN}]
{"o_reg1/QN", "o_reg2/QN"}
prompt> query_objects [get_nets -of_objects $pinsel]
{"NET1QNX", "NET2QNX"}
```

The following example shows that with a collection of cells, you can query the nets connected to those cells.

```
prompt> current_instance block1
block1
prompt> set cellsel [get_cells {o_reg1 o_reg2}]
{"o_reg1", "o_reg2"}
prompt> query_objects [get_nets -of_objects $cellsdl]
{"NET1QX", "NET1QNX", "NET1DX", "NET2QX", "NET2QNX", "NET2DX"}
```

SEE ALSO

```
collections(2)

query_objects(2)
collection_result_display_limit(3)
wildcards(3)
```

get_new_bounds

Creates a collection of bounds from the current design.

SYNTAX

```
collection get_new_bounds
[-quiet]
[-within rectangle]
[-filter expression]
[patterns]
```

Data Types

<i>rectangle</i>	string
<i>expression</i>	Boolean
<i>patterns</i>	list

ARGUMENTS

-quiet
Suppresses the reporting of non-terminal (warning and informational) error messages.

-within *rectangle*
Creates a collection containing all bounds within the specified rectangle.

-filter *expression*
Filters the collection with the *expression* value, which must be a Boolean expression based on bound attributes.

patterns
Creates a collection containing the bounds whose names match the specified patterns. You can specify the patterns by using the following formats:

- * (asterisk) allows all bounds names.
- *hw** allows all horizontal bounds.
- *hw object_id* allows all horizontal bounds with a specified object ID.
- *vw** allows all vertical bounds.
- *vw object_id* allows all vertical bounds with a specified object ID.
By default, the command uses "*" as the pattern.

DESCRIPTION

This command creates a collection of bounds that meet the selection criteria. It returns a collection handle if one or more bounds meet the selection criteria. If no bounds match the selection criteria, it returns an empty string. You can also use the **get_new_bounds** command as an argument to another command or assign its result to

a variable.

See the **collections** man page for information about working with collections.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a new bound named *MB0* and creates a collection containing all bounds within the rectangle specified by coordinates {10 10 20 20}. It filters the collection with the expression value **type==soft**.

```
prompt> create_bound -name MB0 -bounding_box {10 10 20 20
{ "MB0" }

prompt> get_new_bounds -within {0 0 30 30} -filter "type==soft"
{ "MB0" }
```

SEE ALSO

`remove_bounds(2)`

get_object_fixed_edit

Gets the fixed state for the specified objects.

SYNTAX

```
fixed get_object_fixed_edit  
objects
```

Data Types

objects collection

ARGUMENTS

objects
List of objects for which to get the fixed state.

DESCRIPTION

This command gets the fixed state for the specified objects. The state is returned as a list of Boolean numbers.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example inverts the fixed state of all selected objects. (The **invert_list** function inverts the elements of a Boolean list.)

```
prompt> set_object_fixed_edit [get_selection]\  
[invert_list [get_object_fixed_edit [get_selection]]]
```

SEE ALSO

`set_object_fixed_edit(2)`

get_object_name

Returns the name of the object in a single-object collection.

SYNTAX

```
string get_object_name  
collection
```

Data Types

collection string

ARGUMENTS

collection

Specifies the name of the collection that contains the single object whose name is requested.

DESCRIPTION

This command returns the name of the object in a single-object collection. The command works only for collections that contain a single object. If the collection contains more than one object, the command issues an error message.

EXAMPLES

The following example returns the name top as the object contained in the collection returned by the **current_design** command.

```
prompt> get_object_name [current_design]  
Current design is 'top'.  
top
```

The following example issues an error message because the collection returned by the **all_outputs** command contains more than one object.

```
prompt> get_object_name [all_outputs]  
Error: Can't get object name of multiple objects;  
      Only a single object collection accepted.  (UITCL-100)
```

The following example gets names of objects in a multi-object collection, by using the **query_objects** command.

```
prompt> query_objects [all_outputs]  
{a, b, c, OP, Z}
```

SEE ALSO

[dc_shell\(1\)](#)
[collections\(2\)](#)
[query_objects\(2\)](#)

get_object_snap_type

Returns the snap type for the specified object class.

SYNTAX

```
string get_object_snap_type
      -class object_class | -enabled
```

Data Types

object_class string

ARGUMENTS

```
-class object_class
      Specifies the object class to get the snap type for. The valid object classes
      are listed below.
      soft_macro      Soft macros
      plan_group      Plan groups and move bounds
      movebound      Move bounds
      hard_macro      Hard macros
      standard_cell   Standard cells
      routing      Net shapes, vias, and via arrays
      shape      Polygons
      pin      Top-level pins, soft macro pins, and pin guides
      rp_group      Relative placement groups
      This option and the -enabled option are mutually exclusive; you must specify
      one of these options.

-enabled
      Returns a Boolean value indicating whether snapping is enabled, instead of
      returning the snap type. This option and the -class option are mutually
      exclusive. You must specify one of these options.
```

DESCRIPTION

This command returns the snap type for the specified object class when you specify the **-class** option. It returns a Boolean value indicating whether snapping is enabled when you specify the **-enabled** option.

The snap type is the one currently being used for all editing commands to snap objects of that class. Valid values for snap type are listed below.

<i>litho</i>	Design grid (also known as minimum grid)
<i>row</i>	Row edge
<i>row_tile</i>	Row edge and unit tile
<i>row_site</i>	Row edge and placement site
<i>mid_row</i>	Mid row (mostly for soft macro placement)
<i>mid_row_tile</i>	Mid row and unit tile
<i>mid_row_site</i>	Mid row and placement site
<i>flip_chip</i>	Flip-chip grid (for flip chips)

```
unit_tile      Unit tile
wiretrack      Wire track (for pins, wires, paths, and terminals)
halfwiretrack  Mid wire track (for pins, wires, paths, and terminals)
user          User grid
```

EXAMPLES

The following example stores the current snap type for soft macros in the type variable.

```
prompt> set type [get_object_snap_type -class soft_macro]
```

The following example enables snapping if snapping is disabled.

```
prompt> if {! [get_object_snap_type -enabled]} {\`
    set_object_snap_type -enabled 1}
```

SEE ALSO

```
move_objects(2)
resize_objects(2)
rotate_objects(2)
align_objects(2)
distribute_objects(2)
expand_objects(2)
flip_objects(2)
set_object_snap_type(2)
```

get_path_groups

Creates a collection of path groups from the current design.

SYNTAX

```
collection get_path_groups
[-quiet]
[-regexp]
[-nocase]
[-filter expression]

```

Data Types

<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Views the *patterns* argument as a real regular expression rather than as a simple wildcard pattern. It also modifies the behavior of the =~ and !~ filter operators so that they compare with real regular expressions rather than with simple wildcard patterns.

-nocase
Makes matches case-insensitive when combined with the **-regexp** option. You can use the **-nocase** option only when you also use **-regexp**.

-filter *expression*
Filters the collection with the value of the *expression* argument. For any path groups that match the *patterns* option, the expression is evaluated based on the attributes of the path group. If the expression evaluates to true, the path group is included in the result.

patterns
Matches path group names against *patterns*. The *patterns* option can include the * (asterisk) and ? (question mark) wildcard characters.

DESCRIPTION

This command creates a collection of path groups from the current design that match certain criteria. The command returns a collection handle (identifier) if any path groups match the value of the *patterns* option and pass the filter (if specified). If no objects match the criteria, the command returns an empty string.

Path groups control the optimization cost function and also affect timing reports.

get_path_groups

854

You can use the **get_path_groups** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_path_groups** result to a variable.

When issued from the command prompt, **get_path_groups** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum by using the **collection_result_display_limit** variable.

The implicit query property of **get_path_groups** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the **query_objects** option (for example, if you want to display the object class), use **get_path_groups** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command uses information from the current scenario only.

SEE ALSO

```
collections(2)
foreach_in_collection(2)
group_path(2)
query_objects(2)
report_path_group(2)
collection_result_display_limit(3)
```

get_physical_buses

Returns a collection of physical buses from the current design. You can assign these physical buses to a variable or pass them into another command.

SYNTAX

```
collection get_physical_buses
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
objects
| -object_id id
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>id</i>	integer

ARGUMENTS

-quiet
Suppresses warning and error message if no objects match. Does not suppress syntax error messages.

-regexp
Views the *patterns* option as a real regular expression rather than as a simple wildcard pattern. The **-regexp** option also modifies the behavior of the `=~` and `!~` filter operators to behave as regular expressions rather than as simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. Use this when searching for objects that contain the `*` (asterisk) wildcard character.

-filter *expression*
Filters the collection with the value of the *expression* argument. For any physical bus that match the *patterns* option, the *expression* is evaluated based on the attributes of the physical bus. If the expression evaluates to true, the command includes the physical bus in the result.

patterns
Matches physical bus names against the value of the *patterns* option. The *patterns* list can include the wildcard character `*` (asterisk). The **patterns**, **-of_objects**, and **-object_id** arguments are mutually exclusive; you must

specify only one.

-of_objects objects
Creates a collection of physical bus connected to the specified objects. In this case, each object is a net collection. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you must specify only one.

-object_id id
Creates a collection of a physical bus with its Milkyway object ID specified. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you must specify only one.

DESCRIPTION

This command creates a collection of physical buses from the current design that match specific criteria. The command returns a collection handle (identifier) if any physical bus matches the *patterns* option value and passes the filter, if specified. If no objects match the criteria, the command returns an empty string.

You can use the **get_physical_buses** command at the command prompt, nest it as an argument to another command (for example, **report_attributes**), or assign the **get_physical_buses** result to a variable.

When issued from the command prompt, **get_physical_buses** behaves as if you called the **query_objects** command to report the objects in the collection. By default, the command displays a maximum of 100 objects. You can change this maximum by using the **collection_result_display_limit** variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns a collection with one physical bus object whose name is prefixed with UPC.

```
prompt> get_physical_buses UPC*
{UPC_DATA}
```

The following example returns a collection with one physical bus object in which net UPC_DATA[0] is an element.

```
prompt> get_physical_buses -of_objects [get_nets UPC_DATA[0]]
{UPC_DATA}
```

SEE ALSO

```
collections(2)
create_physical_bus(2)
query_objects(2)
remove_physical_bus(2)
report_physical_bus(2)
update_physical_bus(2)
collection_result_display_limit(3)
```

get_physical_lib_cells

Creates a collection of library cells from libraries loaded into the tool.

SYNTAX

```
collection get_physical_lib_cells
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
objects
[-hsc separator]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>separator</i>	string

ARGUMENTS

-filter *expression*

Filters the collection with the value of the *expression* argument. For any library cells that match the *patterns* option or the *objects* argument, the expression is evaluated based on the attributes of the library cell. If the expression evaluates to true, the command includes the library cell in the result.

-quiet

Suppresses information, warning, and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Views the *patterns* option value as real regular expressions rather than as simple wildcard patterns. This option also modifies the behavior of the `=~` and `!~` filter operators to compare them with real regular expressions rather than with simple wildcard patterns. The `fB-regexp` and `-exact` options are mutually exclusive; you can use only one.

-nocase

Makes matches case-insensitive.

-exact

Disables simple pattern matching. Use this when searching for objects that contain the `*` (asterisk) and `?` (question mark) wildcard characters. The `fB-regexp` and `-exact` options are mutually exclusive; you can use only one.

patterns

Matches library cell names against patterns. Patterns can include the `*` (asterisk) and `?` (question mark) wildcard characters or regular expressions,

based on the **-regexp** option. Patterns can also include collections of type lib_cell. The *patterns* and **-of_objects** options are mutually exclusive; you must specify one, but not both.

-of_objects *objects*

Creates a collection of library cells that are referenced by the specified cells or own the specified library pins. In this case, each object is either a named library pin or netlist cell, or a library pin collection or a netlist cell collection. **-of_objects** and *patterns* are mutually exclusive; you must specify only one.

-hsc *separator*

Specifies the hierarchy separator character that is used to create unambiguous names whenever a design uses a / (slash) within an object name. You can use the following characters as hierarchy separator characters: / (slash), @ (at sign), ^ (caret), # (pound sign), . (period), and | (vertical bar). The default is / (slash).

DESCRIPTION

This command creates a collection of library cells from libraries currently loaded into the tool that match certain criteria. The command returns a collection if any library cells match the value of the *patterns* option or the *objects* argument and pass the filter, if specified. If no objects match the criteria, the tool returns an empty string.

Regular expression matching in the **get_physical_lib_cells** command is the same as in the Tcl **regexp** command. When using **-regexp**, take be careful how you quote the *patterns* and filter *expression*. It is recommended that you use rigid quotation marks with curly braces around regular expressions.

Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding .* to the beginning or end of the expressions, as needed.

You can use the **get_physical_lib_cells** command at the command prompt, nest it as an argument to another command (for example, **query_objects**), or assign the **get_physical_lib_cells** result to a variable.

When issued from the command prompt, **get_physical_lib_cells** behaves as if you had called **query_objects** to display the objects in the collection. By default, the command displays a maximum of 100 objects. You can change this maximum by using the **collection_result_display_limit** variable.

The "implicit query" property of **get_physical_lib_cells** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the options of the **query_objects** command (for example, if you want to display the object class), use **get_physical_lib_cells** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries all library cells that are in the misc_cmos library and begin with AN2. Although the output looks like a list, it is just a display.

```
prompt> get_physical_lib_cells misc_cmos/AN2*
{"misc_cmos/AN2", "misc_cmos/AN2P"}
```

The following example shows one way to find out the name of the library cell used by a specific cell.

```
prompt> get_physical_lib_cells\
-of_objects [get_cells o_reg1
{"misc_cmos/FD2"}
```

SEE ALSO

```
collections(2)
filter_collection(2)
get_cells(2)
query_objects(2)
collection_result_display_limit(3)
```

get_physical_lib_pins

Creates a collection of library cell pins from libraries.

SYNTAX

```
collection get_physical_lib_pins
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
objects
[-hsc separator]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-filter *expression*
Filters the collection with *expression*. For any library cell pins that match *patterns* (or *objects*), the expression is evaluated based on the library cell pin's attributes. If the expression evaluates to true, the lib_pin is included in the result.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Views the *patterns* argument as real regular expressions rather than simple wildcard patterns. Also, modifies the behavior of the =~ and !~ filter operators to compare with real regular expressions rather than simple wildcard patterns. The **-regexp** and **-exact** arguments are mutually exclusive.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters. The **-exact** and **-regexp** arguments are mutually exclusive.

patterns
Matches library cell pin names against patterns. Patterns can include the wildcard characters "*" and "?" or regular expressions, based on the **-regexp** option. Patterns can also include collections of type lib_pin. The *patterns* and **-of_objects** arguments are mutually exclusive. You must specify one, but not both.

```

-of_objects objects
    Creates a collection of library cell pins referenced by the specified netlist
    pins or owned by the specified library cells. In this case, each object is
    either a named library cell or netlist pin, or a library cell collection or
    netlist pin collection. The -of_objects and patterns arguments are mutually
    exclusive. You must specify one, but not both.

-hsc separator
    Specifies the hierarchy separator character that is used to create
    unambiguous names whenever a design uses a slash (/) within object names.
    You can use the following characters as hierarchy separator characters: slash
    (/), at sign (@), caret (^), pound sign (#), period (.), and vertical bar (
    | ), with the slash (/) being the default.

```

DESCRIPTION

The **get_physical_lib_pins** command creates a collection of library cell pins from currently loaded libraries that match certain criteria. The command returns a collection if any library cell pins match *patterns* or *objects* and pass the filter (if specified). If no objects matched the criteria, the empty string is returned.

Regular expression matching is the same as in the **regexp** Tcl command. When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*. Using rigid quoting with curly braces around regular expressions is recommended. Regular expressions are always anchored. The expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_physical_lib_pins** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_physical_lib_pins** result to a variable.

When issued from the command prompt, **get_physical_lib_pins** behaves as though **query_objects** had been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_physical_lib_pins** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_physical_lib_pins** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** command man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries all pins of the AN2 library cell in the misc_cmos library. Although the output looks like a list, it is just a display.

```
prompt> [get_physical_lib_pins misc_cmos/AN2/*  
{"misc_cmos/AN2/A", "misc_cmos/AN2/B", "misc_cmos/AN2/Z"}
```

The following example shows one way to determine how the library pin is used by a particular pin in the netlist.

```
prompt> get_physical_lib_pins -of_objects o_reg1/Q  
{"misc_cmos/FD2/Q"}
```

SEE ALSO

```
collections(2)  
filter_collection(2)  
get_physical_libs(2)  
get_physical_lib_cells(2)  
query_objects(2)  
collection_result_display_limit(3)
```

get_physical_libs

Creates a collection of libraries.

SYNTAX

```
collection get_physical_libs
[-filter expression]
[-quiet]
[-regexp [-nocase]]
[-exact]
objects
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-filter *expression*
Filters the collection with the value of the *expression* argument. For any libraries that match the *patterns* option or *objects* argument, the expression is evaluated based on the library's attributes. If the expression evaluates to true, the library is included in the result.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the value of the *patterns* argument as a real regular expression rather than as a simple wildcard pattern. This option also modifies the behavior of the =~ and !~ filter operators to compare with real regular expressions, rather than with simple wildcard patterns. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-nocase
Makes matches case-insensitive when you use it with the **-regexp** option. You can use the **-nocase** option only when you also use the **-regexp** option.

-exact
Disables simple pattern matching. You can use this option when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

patterns
Matches library names against patterns. Patterns can include the wildcard characters the * (asterisk) and ? (question mark) wildcard characters or regular expressions, depending on the use of the **-regexp** option. Patterns can also include collections of lib type. The *patterns* and **-of_objects** options

are mutually exclusive; you must use only one.

-of_objects objects

Creates a collection of libraries that contain the specified objects. In this case, each object is either a named library cell or a library cell collection. The *patterns* and **-of_objects** options are mutually exclusive; you must use only one.

DESCRIPTION

This command creates a collection of libraries from those currently loaded that match certain criteria. The command returns a collection if any libraries match the *patterns* option and pass the filter (if specified). If no objects match the criteria, the command returns an empty string.

Regular expression matching is the same as in the **regexp** Tcl command. When using the **-regexp** option, be careful how you use quotation marks in the *patterns* option and *expression* argument. It is recommended that you use curly braces around regular expressions. Regular expressions are always anchored. The expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding `.*` to the beginning or end of an expression, as needed.

You can use the **get_physical_libs** command at the command prompt or nest it as an argument to another command (such as **query_objects**). You can also assign the **get_physical_libs** result to a variable.

When issued from the command prompt, **get_physical_libs** behaves as if you had called **query_objects** to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change the maximum by using the **collection_result_display_limit** variable.

The implicit query property of **get_physical_libs** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_physical_libs** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries all loaded libraries. Although the output looks like a list, it is just a display. You can use the **list_libraries** command to get a complete listing of libraries.

```
prompt> get_physical_libs *
```

get_physical_libs

866

```
{"misc_cmos", "misc_cmos_io"}
```

The following example shows that you can remove the libraries of a given library collection, but you cannot remove libraries if they are referenced by a design.

```
prompt> remove_reference_library [get_physical_libs misc*]
Removing library misc_cmos...
Removing library misc_cmos_io...
```

SEE ALSO

```
collections(2)
filter_collection(2)
query_objects(2)
collection_result_display_limit(3)
```

get_pin_guides

Retrieves a collection of pin guides existing in the current design.

SYNTAX

```
collection get_pin_guides
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-object_id object_id]
[patterns]
```

Data Types

<i>expression</i>	string
<i>object_id</i>	integer
<i>patterns</i>	string

ARGUMENTS

-filter *expression*

Filters the collection with the value of the *expression* argument. For pin guides that match the specified patterns (or objects), the expression is evaluated based on the attributes of the pin guides. If the expression evaluates to true, the pin guide is included in the result. This option works the same way as the **filter_collection** command works. The **-regexp** and **-nocase** options are applied in the same way as in the **filter_collection** command. See the **filter_collection** man page for more information on how to use a **-filter** option in general.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the value of the *patterns* argument as a real regular expression rather than as a simple wildcard pattern.

-nocase

Makes matches case-insensitive.

-exact

Disables simple pattern matching. Use this option when searching for objects that contain the "*" (asterisk) wildcard as an actual character.

-object_id *object_id*

Specifies the object ID of one pin guide.

patterns

Matches pin guide names against *patterns*. Pattern matching is case sensitive

unless you use the **-nocase** option. The default is * (asterisk).

DESCRIPTION

This command retrieves a collection of pin guides existing in the current design. It returns a collection of all pin guides if no arguments are given to the command. The absence of any arguments is equivalent to using the command **get_pin_guides ***.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example sets all pin guides in the design.

```
prompt> set pin_guides [get_pin_guides]
```

The following example gets pin guides that match the regular expression shown.

```
prompt> set pin_guides [get_pin_guides -regexp "[Pp].*"]
```

SEE ALSO

`create_pin_guide(2)`
`filter_collection(2)`
`report_pin_guides(2)`

get_pin_shapes

Creates a collection of pin shapes that matches the criteria.

SYNTAX

```
collection get_pin_shapes
[-within region
 | -intersect region
 | -touching region
 | -at point]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
[patterns | -of_objects objects]
```

Data Types

<i>region</i>	list
<i>point</i>	string
<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-within *region*

Creates a collection containing all pin shapes within the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-intersect *region*

Creates a collection containing all pin shapes intersect the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron).

The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-touching *region*

Creates a collection containing all pin shapes touching the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{llx lly} {urx ury}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{ {x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate. The coordinate unit is specified in technology file (usually it is micron). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-at *point*

Creates a collection containing all pin shapes that overlap the point specified by the coordinates `{x y}`. The coordinate unit is specified in technology file (usually it is micron). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-quiet

Suppresses the reporting of non-terminal (warning and informational) messages.

-regexp

Uses the *patterns* argument as real regular expressions rather than as simple wildcard patterns. By default, this option is off.

-nocase

Makes the matches case-insensitive. By default, this option is off.

-exact

Disables simple pattern matching. Use this when searching for objects that contain the * (asterisk) wildcard character. By default, this option is off.

-filter *expression*

Filters the collection with the value of *expression*, which must be a Boolean expression based on pin shape attributes. You can determine the pin shape attributes using the **list_attributes** command. If the expression evaluates to **true**, the pin shape is included in the collection. By default, this option is off.

patterns

Matches the pin shape names against the patterns in the current design. The *patterns* and **-of_objects** options are mutually exclusive. If you do not specify either the *patterns* and **-of_objects** options, the command defaults to using * as the pattern.

-of_objects *objects*

Creates a collection containing the pin shapes connected to the specified objects. Each object is a cell or pin.
The *patterns* and **-of_objects** options are mutually exclusive. If you do not

specify either the *patterns* and *-of_objects* options, the command defaults to using "*" as the pattern. By default, this option is off.

DESCRIPTION

This command creates a collection of pin shapes by selecting pin shapes from the current design that meet the selection criteria. It returns a collection handle if one or more pin shapes meet the selection criteria. If no pin shapes match the selection criteria, it returns an empty string.

You can use the **get_pin_shapes** command at the command prompt, use it as an argument nested in another command, or assign its result to a variable.

See the **collections** command man page for information about working with collections.

EXAMPLES

The following example shows that in a collection of pin, you can query the pin shapes connected to the specified pin. You can also fetch the pin shape on metal6 layer using the **-filter** option.

```
prompt> set pin [get_pins tc4/sram_target_2/sram_Q[4]]  
{tc4/sram_target_2/sram_Q[4]}  
prompt> get_pin_shapes -of_objects $pin  
{tc4/sram_target_2/sram_Q[4]}  
prompt> get_pin_shapes -filter {layer =~ "M6"} -of_objects $pin  
{tc4/sram_target_2/sram_Q[4]}
```

The following example shows that in a soft macro, you can select the pin shapes in it.

```
prompt> get_pin_shapes -of_objects \  
tc4st_bus_1/tc4stbus_sram_target_2/sram_interface_16b  
{tc4st_bus_1/tc4stbus_sram_target_2/sram_interface_16b/sram_Q[4] tc4st_bus_1/  
tc4stbus_sram_target_2/sram_interface_16b/test_so_new tc4st_bus_1/  
tc4stbus_sram_target_2/sram_interface_16b/test_so_new 1}
```

The following example fetches an EQ pin shape with its name.

```
prompt> get_pin_shapes {"tc4st_bus_1/tc4stbus_sram_target_2/sram_interface_16b/  
test_so_new 1"}  
{tc4st_bus_1/tc4stbus_sram_target_2/sram_interface_16b/test_so_new 1}
```

The following example gets all pin shapes within a specified rectangle.

```
prompt> get_pin_shapes * \  
-within {{4 20} {10 30}}  
{I_BD_70/gnd I_BD_70/vdd I_BD_70/reset}
```

The following example gets all pin shapes intersect specified polygon:

```
prompt>get_pin_shapes -intersect \
{{30 20} {50 20} {50 30} {40 30} {40 40} {30 40} {30 20}}
{STACK_BLK/MEM_reg_1__0_/VSS STACK_BLK/MEM_reg_9__0_/VDD}
```

SEE ALSO

`collections(2)`
`filter_collection(2)`
`get_pins(2)`
`query_objects(2)`
`collection_result_display_limit(3)`

get_pins

Creates a collection of pins that match the specified criteria.

SYNTAX

```
collection get_pins
[-hierarchical]
[-filter expression]
[-quiet]
[-regexp [-nocase] | -exact]
[patterns
 | -of_objects objects [-leaf]
 | -object_id object_id]
[-all]
[-hsc separator]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	collection
<i>object_id</i>	integer

ARGUMENTS

-hierarchical

Searches for pins level-by-level, relative to the current instance. The full name of the object at a particular level must match the patterns. The search is similar to that of the UNIX **find** command. For example, if there is a pin named block1/adder/D[0], a hierarchical search finds it by using adder/D[0]. You cannot use the **-hierarchical** option if you use the **-of_objects** option.

-filter *expression*

Filters the collection with the value of the *expression* argument. For any pins that match the specified criteria, the expression is evaluated based on the pin's attributes. If the expression evaluates to true, the pin is included in the result.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the value of the *patterns* argument as a real regular expression rather than as a simple wildcard pattern.

This option also modifies the behavior of the `=~` and `!~` filter operators to compare with real regular expressions, rather than with simple wildcard patterns.

The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-nocase

Makes matches case-insensitive when you use it with the **-regexp** option. You

can use the **-nocase** option only when you also use the **-regexp** option.

-exact
Disables simple pattern matching. You can use this option when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters.
The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

patterns
Matches pin names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, see the **wildcards** man page.
The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one.

-of_objects *objects*
Creates a collection of pins connected to the specified objects. Each object can be a cell, net, pin_guide or pin_shape.
The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one. In addition, you cannot use **-hierarchical** if you use the **-of_objects** option.

-leaf
You can use this option only if you also use the **-of_objects** option. For any nets in the *objects* argument, only pins on leaf cells connected to those nets are included in the collection. In addition, hierarchical boundaries are crossed to find pins on leaf cells.

-object_id *object_id*
Specifies the Milkyway object ID of the pin to include in the collection. To determine the *object_id* value, use the **get_attribute** command to return the value of the **object_id** attribute.
The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one.

-all
Includes power and ground pins.

-hsc *separator*
Specifies the hierarchy separator character that is used for this command to create unambiguous names when an object name contains a slash (/). You can use the following characters as hierarchy separator characters: / (slash), @ (at sign), ^ (caret), # (pound sign), . (period), and | (vertical bar). The default is /.

DESCRIPTION

The **get_pins** command creates a collection of pins in the current design, relative to the current instance, that match certain criteria. The command returns a collection if any pins match the *patterns*, *objects*, or *object_id* argument and pass the filter, if specified. If no objects match the criteria, the command returns an empty string.

When you use the **get_pins** command with the **-of_objects** option, it searches for pins connected to any cells or nets specified in the *objects* argument.

There are two variations of pins that are considered for net objects. By default, the command considers only pins connected to the net at the same hierarchical level. When you use the **-leaf** option, the command considers only pins connected to the net that are on leaf cells. In this case, hierarchical boundaries are crossed to find pins on leaf cells. The **-leaf** option has no effect on the pins of cells.

If the *patterns*, *objects*, and *object_id* arguments do not match any objects, and the current design is not linked, the design automatically links.

Regular expression matching is the same as in the **regexp** Tcl command. When using the **-regexp** option, be careful how you use quotation marks in the *patterns* and *expression* arguments. You should use curly braces ({})) around regular expressions. Regular expressions are always anchored. The expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding .* to the beginning or end of an expression, as needed.

You can use the **get_pins** command at the command prompt or nest it as an argument to another command, such as **query_objects**. You can also assign the **get_pins** result to a variable.

When issued from the command prompt, **get_pins** behaves as if you had called the **query_objects** command to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change the maximum by using the **collection_result_display_limit** variable.

The implicit query property of **get_pins** provides a fast, simple way to display pins in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_pins** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the CP pins of cells that begin with o. Although the output looks like a list, it is just a display.

```
prompt> get_pins o*/CP
{o_reg1/CP o_reg2/CP o_reg3/CP o_reg4/CP}
```

The following example shows that given a collection of cells, you can query the pins connected to those cells:

```
prompt> set csel [get_cells o_reg1]
{o_reg1}
```

```
prompt> query_objects [get_pins -of_objects $csel]  
{o_reg1/D o_reg1/CP o_reg1/CD o_reg1/Q o_reg1/QN}
```

The following example shows the difference between getting local pins of a net and leaf pins of net. In this example, NET1 is connected to i2/aP and reg1/QN. Cell i2 is hierarchical. Within cell i2, port a is connected to U1/A and U2/A.

```
prompt> get_pins -of_objects [get_nets NET1]  
{i2/a reg1/QN}
```

```
prompt> get_pins -leaf -of_objects [get_nets NET1]  
{i2/U1/A i2/U2/A reg1/QN}
```

The following example shows how to create a clock using a collection of pins:

```
prompt> create_clock -period 8 -name CLK [get_pins o_reg*/CP]  
1
```

SEE ALSO

```
collections(2)  
create_clock(2)  
filter_collection(2)  
get_cells(2)  
query_objects(2)  
collection_result_display_limit(3)  
wildcards(3)
```

get_placement_area

Returns a list of coordinates for the current core placement area.

SYNTAX

```
string get_placement_area
```

ARGUMENTS

None.

DESCRIPTION

Returns a list of coordinates for the current core placement area. Returns a list of float numbers in the order of lower-left corner coordinates and upper-right corner coordinates. If the core area is not defined in the current design, the command returns an error message.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows how to get the core placement area coordinates in the current design.

```
prompt> get_placement_area
```

SEE ALSO

[create_placement\(2\)](#)

get_placement_blockages

Creates a collection of placement blockages from the current design.

SYNTAX

```
collection get_placement_blockages
[-within rectangle | -touching rectangle]
[-filter expression]
[-quiet]
[-type hard | soft | pin | hard_macro | partial]
[patterns]
```

Data Types

<i>rectangle</i>	list
<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-within *rectangle*
Creates a collection containing all blockages within the specified rectangle. The valid format of the rectangle is {{llx lly} {urx ury}}, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is micron). The **-within** and **-touching** options are mutually exclusive; you can specify only one.

-touching *rectangle*
Creates a collection containing all blockages touching (not partly or totally outside) the specified rectangle. The valid format of the rectangle is {{llx lly} {urx ury}}, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is micron). The **-within** and **-touching** options are mutually exclusive; you can specify only one.

-filter *expression*
Filters the collection with expression. For any placement blockages that match the patterns option, the expression is evaluated based on the attributes of the placement blockages. If the expression evaluates to *true*, the placement blockages is included in the result.

-quiet
Suppresses warning and error messages.

-type hard | soft | pin | hard_macro | partial
Indicates the type of placement blockage. By default, this command matches all kinds of placement blockages.

patterns
Specifies the placement blockages. The patterns can be a collection handle

of blockages or other formats, similar to the following:

- * (asterisk) indicates all placement blockages
- xx* indicates any placement blockage whose name begins with xx
- pb#77 indicates one placement blockage that does not yet have a name and its object_id is 77
- pb#* indicates any placement blockage that does not yet have a name. If this argument is not specified, this command uses * (asterisk) as the pattern.

DESCRIPTION

This command creates a collection of placement blockages that meet the selection criteria. It returns a collection handle if one or more blockages meet the selection criteria. If no blockages match the selection criteria, it returns an empty string. Use the **get_placement_blockages** command as an argument to another command or assign its result to a variable. Refer to the example below for details.

See the **collection** command man page for information about working with collections.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples show some uses of this command to create placement blockages:

```
prompt> get_placement_blockages * -within {{2 2} {25 25}}
{"PB#5389" }

prompt> get_placement_blockages * -filter "area > 1000"
 {"PB#4683" }
```

SEE ALSO

```
create_placement_blockage(2)
get_attribute(2)
get_route_guides(2)
query_objects(2)
remove_placement_blockage(2)
remove_route_guide(2)
```

get_plan_groups

Returns a collection of plan groups from the current design.

SYNTAX

```
collection get_plan_groups
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
objects
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-quiet
Suppresses warning and error messages, if no objects match. Does not suppress syntax error messages.

-regexp
Views the *patterns* argument as a real regular expression rather than a simple wildcard pattern. This option also modifies the behavior of the `=~` and `!~` filter operators to behave as regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. For use when searching for objects that contain the `*` wildcard character.

-filter *expression*
Filters the collection with *expression*. For any plan group that match the *patterns* option, the expression is evaluated based on the plan group's attributes. If the expression evaluates to `true`, the plan group is included in the result.

patterns
Matches plan group names against *patterns*. The *patterns* list can include the wildcard character `"*"`.

-of_objects *objects*
Creates a collection of plan groups connected to the specified objects. In this case, each object is a cell collection. The **-of_objects** and *patterns* arguments are mutually exclusive; you must specify one, but not both.

DESCRIPTION

The **get_plan_groups** command creates a collection of plan group from the current design that match certain criteria. The command returns a collection handle (identifier) if any plan group match the *patterns* and pass the filter (if specified). If no objects match the criteria, the empty string is returned.

You can use the **get_plan_groups** command at the command prompt, or you can nest it as an argument to another command (for example, **report_attributes**). In addition, you can assign the **get_plan_groups** result to a variable.

When issued from the command prompt, **get_plan_groups** behaves as though **report_attributes** has been called to report the objects in the collection. By default, a maximum of 100 objects are displayed. You can change this maximum using the variable **collection_result_display_limit**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples get all the plan groups with the name starting with timer.

```
prompt> get_plan_groups timer*
```

SEE ALSO

```
collections(2)
foreach_in_collection(2)
query_objects(2)
create_plan_groups(2)
remove_plan_groups(2)
collection_result_display_limit(3)
```

get_polygon_area

Calculate the area of the input polygon.

SYNTAX

```
double get_polygon_area  
polygon
```

Data Types

polygon list

ARGUMENTS

polygon

A list of points that represents a polygon and the format is like this: {{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}. The coordinate unit is specified in technology file (usually it is micron).

DESCRIPTION

This command returns the area covered by the input polygon. The input for this command is a list of points which represents a polygon; and the returned value represents the area of the input polygons. Before this command is used, the library should be opened.

EXAMPLES

The following command returns a value represents the area of the input polygons.

```
prompt>get_polygon_area {{5 5} {20 5} {20 20} {15 20} {15 10} \  
{10 10} {10 15} {5 15} {5 5}}  
150.0
```

SEE ALSO

`convert_to_polygon(2)`
`resize_polygon(2)`

get_ports

Creates a collection of ports from the current design.

SYNTAX

```
collection get_ports
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
objects
  | -object_id object_id
[-all]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>object_id</i>	integer

ARGUMENTS

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters.

-filter *expression*
Filters the collection with *expression*. For any ports that match the specified criteria, the expression is evaluated based on the port's attributes. If the expression evaluates to true, the cell is included in the result.

patterns
Matches port names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards refer to the **wildcards** man page. The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can specify only one of these arguments.

```
-of_objects objects
    Creates a collection of ports connected to the specified objects. Each object
    can be a named net, terminal, bound, net collection, terminal collection,
    bound collection. The patterns, -of_objects, and -object_id arguments are
    mutually exclusive; you can specify only one of these arguments.

-object_id object_id
    Specifies the Milkyway object ID of the port to include in the collection.
    To determine the id value, use the get_attribute command to return the value
    of the object_id attribute. The patterns, -of_objects, and -object_id
    arguments are mutually exclusive; you can specify only one of these
    arguments.

-all
    Includes power and ground ports.
```

DESCRIPTION

The **get_ports** command creates a collection of ports in the current design that match certain criteria. The command returns a collection if any ports match *patterns*, *objects*, or *object_id* and pass the filter (if specified). If no objects match the criteria, the empty string is returned.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns* and filter *expression*. Use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can expand the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_ports** command at the command prompt, or you can nest it as an argument to another command, such as **query_objects**. In addition, you can assign the **get_ports** result to a variable.

When issued from the command prompt, **get_ports** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum using the **collection_result_display_limit** variable.

The implicit query property of **get_ports** provides a fast, simple way to display ports in a collection. However, if you want the flexibility provided by the **query_objects** options (for example, if you want to display the object class), use **get_ports** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page. In addition, refer to the man pages for the **all_inputs** and **all_outputs** commands, which also create collections of ports.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries all input ports beginning with *mode*. Although the output looks like a list, it is just a display.

```
prompt> get_ports "mode*" -filter {@port_direction == in}  
{"mode[0]", "mode[1]", "mode[2]"}
```

The following example sets the driving cell for ports beginning with *in* to an FD2.

```
prompt> set_driving_cell -cell FD2 -library my_lib [get_ports in*]
```

The following example reports ports connected to nets matching the pattern *bidir**.

```
prompt> report_port [get_ports -of_objects [get_nets "bidir*"]]
```

The following example get the ports connected to terminals matching the pattern "CC*".

```
prompt> get_ports -of_objects [get_terminals "CC*"]  
{CC CCEN}
```

wildcards(3)

get_power_domains

Creates a collection of power domains that meet the specified criteria.

SYNTAX for UPF Mode

```
collection get_power_domains

[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[[patterns] [-hierarchical] | -of_objects objects]
```

Data Types for UPF Mode

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

SYNTAX for Non-UPF Mode

```
collection get_power_domains

[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[patterns]
[-of_objects objects]
```

Data Types for Non-UPF Mode

<i>expression</i>	string
<i>patterns</i>	list
<i>cells</i>	collection

ARGUMENTS

-filter *expression*

Filters the collection with *expression*. For any power domains that match *patterns*, the expression is evaluated based on the power domain's attributes. If the expression evaluates to true, the power domain is included in the result.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
 Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase
 Makes matches case-insensitive.

-exact
 This option is available only in UPF mode. Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters.

-hierarchical
 This option is available only in UPF mode. Searches for power domains in the current scope and all of its descendant scopes. If you specify this option, you can specify only simple names in the *patterns* argument; the name cannot contain hierarchy delimiter characters.
 If you do not specify this option, the tool searches for power domains only in the current scope and you can use hierarchy delimiter characters in the *patterns* argument to specify hierarchical power domain names relative to the current scope.
 You cannot specify this option when you use the **-of_objects** option.

patterns
 Matches power domain names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, refer to the **wildcards** man page.
 The *patterns* argument and **-of_objects** option are mutually exclusive. If you do not specify either, the tool uses "*".

-of_objects objects
 Returns a collection of power domains associated with the specified objects. In UPF mode, the objects can be cells, supply nets, supply ports, or power switches. In non-UPF mode, the objects must be cells.
 The *patterns* argument and **-of_objects** option are mutually exclusive. If you do not specify either, the tool uses "*".

DESCRIPTION

The **get_power_domains** command creates a collection of power domains in the current design, that match certain criteria. If no power domains match the criteria, an empty string is returned. In UPF mode, if no power domains match the criteria and the design is not linked, the tool automatically links the design.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the patterns and filter expression. Use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_power_domains** command at the command prompt, or you can nest it as an argument to another command, such as **report_power_domain**. In addition, you can assign the **get_power_domains** result to a variable.

When issued from the command prompt, **get_power_domains** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum by using the **collection_result_display_limit** variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following non-UPF mode example creates power domains, then queries them.

```
prompt> create_power_domain TOP_DOMAIN
1
prompt> create_power_domain SUB_DOMAIN -power_down \
           -power_down_ctrl [get_nets pd_ctrl] \
           -power_down_ack [get_nets pd_ack] \
           -object_list [get_cells mid1]
1
prompt> get_power_domains
{TOP_DOMAIN SUB_DOMAIN}
prompt> get_power_domains TOP*
{TOP_DOMAIN}
```

The following UPF mode example gets all power domains under the current scope.

```
prompt> get_power_domains -hierarchical {PD1 SUB_INST/PD2}
```

SEE ALSO

```
create_power_domain(2)
remove_power_domain(2)
report_power_domain(2)
```

get_power_switches

Creates a collection of power switches that meet the specified criteria. This command is supported only in UPF mode.

SYNTAX

```
collection get_power_switches
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[patterns] [-hierarchical]
| -of_objects objects
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-filter *expression*
Filters the collection with *expression*. For any power switches that match *patterns*, the expression is evaluated based on the power switch's attributes. If the expression evaluates to true, the power switch is included in the result.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. This is used when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters.

patterns
Matches power switch names against *patterns*. Patterns can include the * (asterisk) and ? (question mark) wildcard characters. For more details about using and escaping wildcards, refer to the **wildcards** man page. The *patterns* argument and **-of_objects** option are mutually exclusive. If you do not specify either, the tool uses "*".

-hierarchical

Searches for power switches in the current scope and all of its descendant scopes. If you specify this option, you can specify only simple names in the *patterns* argument; the name cannot contain hierarchy delimiter characters. If you do not specify this option, the tool searches for power switches only in the current scope and you can use hierarchy delimiter characters in the *patterns* argument to specify hierarchical power switches relative to the current scope. This option is mutually exclusive with the **-of_objects** option.

-of_objects objects

Returns a collection of power switches associated with the specified objects. The objects can be power domains or supply nets. The *patterns* argument and **-of_objects** option are mutually exclusive.

DESCRIPTION

The **get_power_switches** command creates a collection of power switches in the current design, that match certain criteria. If no power switches match the criteria and the design is not linked, the tools automatically links the design. If there are still no supply nets that match the criteria, an empty string is returned.

Regular expression matching is the same as in the Tcl regexp command. When using **-regexp**, use care in the way you quote the patterns and filter expression. Use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can broaden the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_power_switches** command at the command prompt, or you can nest it as an argument to another command, such as **report_supply_net**. In addition, you can assign the **get_power_switches** result to a variable.

When issued from the command prompt, **get_power_switches** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum by using the **collection_result_display_limit** variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets all power switches under the current scope:

```
prompt> get_power_switches -hierarchical
{SW1 SUB_INST/SW2}
```

SEE ALSO

`create_power_switch(2)`
`remove_power_switch(2)`
`report_power_switch(2)`

get_route_guides

Creates a collection of route guides from the current design.

SYNTAX

```
collection get_route_guides
[-within rectangle | -touching rectangle]
[-filter expression]
[-quiet]
[patterns]
```

Data Types

<i>rectangle</i>	list
<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-within *rectangle*

Creates a collection containing all route guides within the specified rectangle. The valid format of the rectangle is {{llx lly} {urx ury}}, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is micron). The **-within** and **-touching** options are mutually exclusive; you can specify only one.

-touching *rectangle*

Creates a collection containing all route guides touching the specified rectangle. The valid format of the rectangle is {{llx lly} {urx ury}}, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is micron). The **-within** and **-touching** options are mutually exclusive; you can specify only one.

-filter *expression*

Filters the collection with *expression*. For any route guides that match the patterns option, the expression is evaluated based on the route guides' attributes. If the expression evaluates to *true*, the route guide is included in the result.

-quiet

Suppresses warning and error messages.

patterns

Specifies the route guides. The patterns can be a collection handle of route guides or other formats, similar to the following:

- * (asterisk) or rg* indicates all route guides

- `rg7789` indicates one route guide whose `object_id` is 7789. If this argument is not specified, the command uses * (asterisk) as the pattern.

DESCRIPTION

This command creates a collection of route guides that meet the selection criteria. It returns a collection handle if one or more route guides meet the selection criteria. If no route guides match the selection criteria, it returns an empty string. Use the `get_route_guides` command as an argument to another command or assign its result to a variable. Refer to the example below for more information.

See the `collection` command man page for information about working with collections.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples show some uses of this command to create route guide collections:

```
prompt> get_route_guides * -within {{2 2} {25 25}}
{"RG5389"}

prompt> get_route_guides * -touching {{10 5} {20 5} {20 15} {10 15} {10 5}}
{"RG5938"}

prompt>get_route_guides * -filter "area > 1000"
 {"RG4683"}
```

SEE ALSO

```

get_attribute(2)
get_placement_blockages(2)
query_objects(2)
remove_placement_blockage(2)
remove_route_guide(2)
```

get_route_mode_options

Gets the mode value for running zroute.

SYNTAX

```
status get_route_mode_options
[-zroute]
```

ARGUMENTS

-zroute
Returns the mode value for running zroute.

DESCRIPTION

This command gets the value which specifies whether zroute is selected as the default router.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command returns the value of the mode for running zroute.

```
prompt> get_route_mode_options -zroute
```

SEE ALSO

`set_route_mode_options(2)`

get_route_zrt_common_options

Gets the values of the specified common route options.

SYNTAX

```
status get_route_zrt_common_options
[-name pattern]
```

Data Types

pattern string

ARGUMENTS

-name *pattern*
Specifies the option to return the value for.
By default, the command returns the value for all common route options.

DESCRIPTION

This command gets the value of the specified options.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command returns the values of all common route options.

```
prompt> get_route_zrt_common_options
```

SEE ALSO

```
set_route_zrt_common_options(2)
report_route_zrt_common_options(2)
```

get_route_zrt_detail_options

Gets the values of the specified drooute options.

SYNTAX

```
status get_route_zrt_detail_options
[-name pattern]
```

Data Types

pattern string

ARGUMENTS

```
-name pattern
      Specifies the option to return the value for.
      By default, the command returns the value for all drooute options.
```

DESCRIPTION

This command gets the value of the specified options.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command returns the values of all drooute options.

```
prompt> get_route_zrt_detail_options
```

SEE ALSO

```
set_route_zrt_detail_options(2)
report_route_zrt_detail_options(2)
```

get_route_zrt_global_options

Gets the values of the specified groute options.

SYNTAX

```
status get_route_zrt_global_options
[-name pattern]
```

Data Types

pattern string

ARGUMENTS

-name *pattern*
Specifies the option to return the value for.
By default, the command returns the value for all groute options.

DESCRIPTION

This command gets the value of the specified options.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command returns the values of all groute options.

```
prompt> get_route_zrt_global_options
```

SEE ALSO

```
set_route_zrt_global_options(2)
report_route_zrt_global_options(2)
```

get_route_zrt_track_options

Gets the values of the specified track assignment options.

SYNTAX

```
status get_route_zrt_track_options
[-name pattern]
```

Data Types

pattern string

ARGUMENTS

-name *pattern*
Specifies the option to return the value for.
By default, the command returns the value for all track assignment options.

DESCRIPTION

This command gets the value of the specified options.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command returns the values of all track assignment options.

```
prompt> get_route_zrt_track_options
```

SEE ALSO

```
set_route_zrt_track_options(2)
report_route_zrt_track_options(2)
```

get_routing_blockages

Creates a collection of routing blockages from the current design.

SYNTAX

```
collection get_routing_blockages
[-within rectangle
 | -intersect rectangle
 | -touching rectangle
 | -at point]
[-filter expression]
[-quiet]
[-type via | metal]
[patterns]
```

Data Types

<i>rectangle</i>	list of points
<i>point</i>	point
<i>expression</i>	string
<i>patterns</i>	string

ARGUMENTS

-within *rectangle*

Creates a collection containing all routing blockages within the specified rectangle. The format of a rectangle specification is {llx lly} {urx ury}, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is microns). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-intersect *rectangle*

Creates a collection containing all routing blockages that intersect the specified rectangle. The format of a rectangle specification is {llx lly} {urx ury}, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is microns). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-touching *rectangle*

Creates a collection containing all routing blockages touching the specified rectangle. The format of a rectangle specification is {llx lly} {urx ury}, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is microns). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-at *point*

Creates a collection containing all routing blockages that overlap the point specified by the coordinates {x y}. The coordinate unit is specified in

technology file (usually it is microns).
The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-filter expression
Filters the collection with *expression*, which must be a Boolean expression based on the following routing blockage attributes:
Attribute namesDescription
bboxThe bounding box of the routing blockage
pointsCoordinates of the rectangle or polygon
nameName of the routing blockage
layerThe name of the layer that the routing blockage is on
layer_numberThe number of the layer that the routing blockage is on
areaThe area of the rectangle of the routing blockage
The tool evaluate the expression for any routing blockages that matches the *patterns* argument. If the expression evaluates to true, the routing blockage is included in the result.

-quiet
Suppresses warning and error messages.

-type via | metal
This option to identify what type routing blockage do you want to query.
If you specify **-type via**, the command returns the routing blockages located on the via1Blockage-via14Blockage and polyContBlockage layers.
If you specify **-type metal**, the command returns the routing blockages located on the metal1Blockage-metal15Blockage and polyBlockage layers.
If you do not specify this option, the command returns all routing blockages in the current design that meet the selection criteria.

patterns
Matches the routing blockage names in the current design against the specified patterns. You can specify the patterns by using the following formats:
* A collection of routing blockages
* An asterisk (*), which indicates all routing blockages
* Routing blockage names, which are in the format RB_object_id
If you do not specify this argument, the command uses asterisk (*).

DESCRIPTION

This command returns a collection of routing blockages of the current design that meet the selection criteria. You can use this command to query the routing blockages inside the Milkyway database by area, by point, or by rectangle. You can also use this command to query routing blockages by filtering their attributes.

EXAMPLES

The following example returns the routing blockages within the rectangle with the lower-left corner at {2 2} and the upper-right corner at {25 25}.

```
prompt> get_routing_blockages * -within {{2 2} {25 25}}
{"RB_5389"}
```

The following example returns the routing blockages whose area is larger than 1000.

```
prompt> get_routing_blockages * -filter ,Äúarea > 1000"
{"RB_4683"}
```

The following example returns all routing blockages.

```
prompt> get_routing_blockages "RB_*"
{"RB_4683 RB_5389"}
```

The following example shows how to use **get_attribute** to query the value of the routing blockage attributes.

```
prompt> get_attribute [get_routing_blockages RB_4683] layer
via3Blockage
prompt> get_attribute [get_routing_blockages RB_4683] bbox
{0.000 0.000{{100.000 100.000}
prompt> get_attribute [get_routing_blockages RB_4683] area
10000.000000
```

To get a complete report of the attribute values of all routing blockages, use the **report_attribute** command, as shown in the following example.

```
prompt> report_attribute -application [get_routing_blockages RB_4683]
Design Object Type Attribute Name Value
-----
CORE RB_4683 float area 10000.000000
CORE RB_4683 string bbox {0.000 0.000} {100.000 100.000}
CORE RB_4683 int cell_id 3
CORE RB_4683 string full_name CORE/RB_4683
CORE RB_4683 string layer via3Blockage
CORE RB_4683 int layer_number 217
CORE RB_4683 string name RB_4683
CORE RB_4683 string object_class route_guide
CORE RB_4683 int object_id 1234
CORE RB_4683 string object_type RECTANGLE
```

get_rp_group_keepouts

Creates a collection of the specified relative placement group keepouts.

SYNTAX

```
collection get_rp_group_keepouts
[-quiet]
[patterns]
[-exact]
[-regexp]
[-filter expression]
[-of_objects objects]
```

Data Types

patterns list

ARGUMENTS

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

patterns

Matches relative placement group keepout names against the specified patterns. The format of each pattern string is `design_name::rp_group_name::keepout_name`. If you do not specify this argument, the command returns a collection contain all relative placement group keepouts in the current design.

DESCRIPTION

The `get_rp_group_keepouts` command creates a collection of relative placement group keepouts that match the specified patterns. This command is supported only for designs that do not contain multiply-instantiated designs.

If no objects match the criteria, the empty string is returned. If you omit the `patterns` argument, the command returns all the relative placement group keepouts in the current design.

By default, a maximum of 100 objects is displayed when using the command at the command prompt. You can change this maximum by using the `collection_result_display_limit` variable.

EXAMPLES

The following example queries the keepouts in relative placement. Although the output looks like a list, it is not. The output is just a display.

```
prompt> get_rp_group_keepouts ripple::grp_ripple::keepout1
{ripple::grp_ripple::keepout1}
prompt> get_rp_group_keepouts
{ripple::grp_ripple::keepout1 ripple::grp_ripple::keepout2 ripple::grp_ripple::keep
out3}
```

SEE ALSO

`create_rp_group(2)`
`add_to_rp_group(2)`
`remove_from_rp_group(2)`
`write_rp_groups(2)`

get_rp_groups

Creates a collection of relative placement groups.

SYNTAX

```
collection get_rp_groups
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-ignored]
[-top]
[-filter expression]
[patterns | -of_objects objects]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the *patterns* argument as regular expressions rather than simple wildcard patterns.

-nocase
Makes the matches case-insensitive.

-exact
Disables simple pattern matching. For use when searching for objects that contain the * (asterisk) wildcard character.

-ignored
Specifies that only ignored relative placement groups should be collected.

-top
Specifies that only top level relative placement groups should be collected.

-filter *expression*
Filters the collection with the value of *expression*. For any relative placement groups that match the specified criteria, the expression is evaluated based on the relative placement group's attributes. If the expression evaluates to true, the relative placement group is included in the result.

patterns

Matches relative placement group names against patterns (or regular expressions if you use the **-regexp** option). The format of each pattern string can be in either *design_name*:::*rp_group_name* or *rp_group_name*. Both *design_name* and *rp_group_name* can include the wildcard characters * (asterisk) and ? (question mark). For details about using and escaping wildcard characters see the **wildcards** man page.

The *patterns* and **-of_objects** options are mutually exclusive; you can choose only one.

-of_objects objects

Creates a collection of relative placement groups containing the specified objects. In this case, each object is either a cell, an instantiated or included relative placement group or a relative placement group keepout. The *patterns* and **-of_objects** options are mutually exclusive; you can use only one.

If you do not specify *patterns* or **-of_objects**, the command returns a collection containing all relative placement groups in the current design.

DESCRIPTION

The **get_rp_groups** command creates a collection of relative placement groups, that match certain criteria. This command is supported only for designs that do not contain multiply-instantiated designs. If no objects match the criteria, the empty string is returned.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the *patterns*; use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_rp_groups** command at the command prompt, or you can nest it as an argument to another command, such as **set_rp_group_options**. In addition, you can assign the **get_rp_groups** result to a variable.

By default, a maximum of 100 objects is displayed when using the command at the command prompt. You can change this maximum by using the **collection_result_display_limit** variable.

The implicit query property of **get_rp_groups** provides a fast, simple way to display relative placement groups in a collection.

Relative placement usage is available with Design Compiler Ultra.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the relative placement groups starting with **g** and in a design starting with **r**. Although the output looks like a list, the output is just a display.

```
prompt> get_rp_groups r*::g*
{ripple::grp_ripple}
```

The following example sets the utilization attribute of relative placement groups using **get_rp_groups**:

```
prompt> set_rp_group_options [get_rp_groups r*::g*] \
-utilization 0.95
{ripple::grp_ripple}
```

The following example queries the relative placement groups that have 8 rows:

```
prompt> get_rp_groups -filter rows==8
{mul::grp_mul}
```

The following example queries the relative placement groups that include the cell U17 or the rp_group example3::block2:

```
prompt> get_rp_groups\
-of_objects {U17 example3::block2}
{example3::gp_2_in_example3 example3::top_group}
```

SEE ALSO

`add_to_rp_group(2)`
`all_rp_groups(2)`
`create_rp_group(2)`
`remove_from_rp_group(2)`
`set_rp_group_options(2)`
`write_rp_groups(2)`

get_scan_cells_of_chain

Returns a collection containing all scan cells of the specified scan chain.

SYNTAX

```
collection get_scan_cells_of_chain
-chain chain_name
```

Data Types

chain_name string

ARGUMENTS

```
-chain chain_name
      Specifies the name of the scan chain.
```

DESCRIPTION

This command returns a Tcl collection containing all scan cells for the specified scan chain.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example gets all scan cells of the *chain1* scan chain.

```
prompt> get_scan_cells_of_chain -chain "chain1"
```

SEE ALSO

`get_scan_chains(2)`

get_scan_chains

Returns the number of scan chains in the current design.

SYNTAX

```
status get_scan_chains
```

ARGUMENTS

The **get_scan_chains** command has no arguments.

DESCRIPTION

This command returns the number of scan chains in the current design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example shows how to get the number of scan chains in the design.

```
prompt> get_scan_chains
```

SEE ALSO

`get_scan_cells_of_chain(2)`

get_selection

Returns a collection containing the current selection in the GUI.

SYNTAX

```
collection get_selection
[-slct_targets target_selection_bus
[-slct_targets_operation operation] ]
-create_slct_buses
[-name selection_bus]
[-type object_type]
[-design design]
[-more_than more]
[-fewer_than fewer]
[-count]
[-num num]
```

Data Types

<i>target_selection_bus</i>	string
<i>operation</i>	string
<i>selection_bus</i>	string
<i>object_type</i>	string
<i>design</i>	string
<i>more</i>	integer
<i>fewer</i>	integer
<i>num</i>	integer

ARGUMENTS

-slct_targets *target_selection_bus*

Specifies the name of a selection bus in which to store the result. When you use this option, the *target_selection_bus* value is also returned as result of the command. By default, the result is returned in a collection.

-slct_targets_operation *operation*

Specifies which operation should be used when storing the result in the selection bus specified by the *target_selection_bus* argument. The valid values for the *operation* argument are **clear**, **add**, and **remove**. You can use the **-slct_targets_operation** option only if you also use the **-slct_targets** option.

-create_slct_buses

Specifies to create a new selection bus in which to store the result. Using this option is equivalent to using the **create_selection_bus** command to create a selection bus and then providing the created selection bus to the **-slct_targets** option.

-name *selection_bus*

Specifies the selection bus from which the selection is taken.

-type *object_type*

Specifies the type of selected object with which to filter the selection. The

valid values for *object_type* and their descriptions are as follows:

```
design -design object
port -port object
net -net object
cell -cell object
pin -pin object
path -timing path object

-design design
    Returns only objects in the filter specified by the value of design.

-more_than more
    Returns true if the selection bus contains more than the number of objects
    specified by more.

-fewer_than fewer
    Returns true if the selection bus contains more than the number of objects
    specified by fewer.

-count
    Returns the number of elements contained in the selection bus.

-num num
    Returns only the number of objects specified by num or fewer.
```

DESCRIPTION

This command returns the current selection in the tool as a collection. It returns a collection handle (identifier) if any objects are selected. If no objects are selected, the command returns an empty string. If you do not use the **-type** option, the command returns a heterogeneous collection of all objects currently selected. If you use **-type**, the collection is filtered to a homogeneous one containing only objects of the type you specify.

You can use the **get_selection** command at the command prompt, or you can nest it as an argument to another command (for example, **query_objects**), or assign the **get_selection** result to a variable.

When issued from the command prompt, **get_selection** behaves as if you had called **query_objects** to display the objects in the collection. By default, the command displays a maximum of 100 objects. You can change this maximum by using the **collection_result_display_limit** variable.

The "implicit query" property of **get_selection** provides a fast, simple way to display cells in a collection. However, if you want the flexibility provided by the options of the **query_objects** command (for example, if you want to display the object class), use **get_selection** as an argument to **query_objects**.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns the collection of the selected cell objects.

```
prompt> get_selection -type cell
{"I_PRGRM_CNT_TOP", "I_DATA_PATH", "I_REG_FILE", "I_STACK_TOP"}
```

The following example assigns the collection to a variable named **collect_a** that is passed to the **query_objects** command.

```
prompt> set collect_a [get_selection -type cell]
{"I_PRGRM_CNT_TOP", "I_DATA_PATH", "I_REG_FILE", "I_STACK_TOP"}
prompt> query_objects $collect_a
{"I_PRGRM_CNT_TOP", "I_DATA_PATH", "I_REG_FILE", "I_STACK_TOP"}
```

SEE ALSO

```
change_selection(2)
collections(2)
filter_collection(2)
query_objects(2)
```

get_si_xtalk_bumps

Reports individual aggressor bumps for a given net.

SYNTAX

```
status get_si_xtalk_bumps
net
```

ARGUMENTS

net

Reports the xtalk bumps for the given net.

DESCRIPTION

This command reports xtalk bumps (4 values) for each individual aggressor. The information is given in the following format, which is shown on separate lines for display purposes only. When you use it, you can use 1 continuous line.

```
{aggr1 max_rise_bump max_fall_bump min_rise_bump min_fall_bump}
{aggr2 max_rise_bump max_fall_bump min_rise_bump min_fall_bump} ...
...
```

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example shows detailed aggressor bumps for a net that starts with DSPCORE31/exetop0/e_dptop0/abs_sftw_0_.

```
prompt> get_si_xtalk_bumps \
DSPCORE31/exetop0/e_dptop0/abs_sftw_0_
{DSPCORE31/exetop0/e_dptop0/abs_sftw_4_ 0.0683 0.0521 0.0705 0.0672}
{DSPCORE31/exetop0/e_dptop0/e_lu0/N1338 0.0438 0.0300 0.0448 0.0438}
```

SEE ALSO

`report_noise(2)`

get_site_rows

Returns a collection of site rows from the current design. You can assign these site rows to a variable or pass them into another command.

SYNTAX

```
collection get_site_rows
[-quiet]
[-regexp]
[-nocase]
[-exact]
[-filter expression]
objects
| -object_id id
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list
<i>id</i>	int

ARGUMENTS

-quiet
Suppresses warning and error messages, if no objects match. Does not suppress syntax error messages.

-regexp
Views the *patterns* argument as a real regular expression rather than a simple wildcard pattern. This option also modifies the behavior of the `=~` and `!~` filter operators to behave as regular expressions rather than simple wildcard patterns.

-nocase
Makes matches case-insensitive.

-exact
Disables simple pattern matching. For use when searching for objects that contain the `*` wildcard character.

-filter *expression*
Filters the collection with *expression*. For any site row that match the *patterns* option, the expression is evaluated based on the site row's attributes. If the expression evaluates to `true`, the site row is included in the result.

patterns
Matches site row names against *patterns*. The *patterns* list can include the wildcard character `"*"`.
The `-of_objects`, *patterns* and `-object_id` arguments are mutually exclusive;

you must specify one, but not more than one.

-of_objects objects

Creates a collection of site row connected to the specified objects. In this case, each object is a core area collection. The **-of_objects**, *patterns* and **-object_id** arguments are mutually exclusive; you must specify one, but not more than one.

-object_id id

Creates a collection of a site row with its Milkyway object ID specified. The **-of_objects**, *patterns* and **-object_id** arguments are mutually exclusive; you must specify one, but not more than one.

DESCRIPTION

The **get_site_rows** command creates a collection of site rows from the current design that match certain criteria. The command returns a collection handle (identifier) if any site row match the *patterns* and pass the filter (if specified). If no objects match the criteria, the empty string is returned.

You can use the **get_site_rows** command at the command prompt, or you can nest it as an argument to another command (for example, **report_attributes**). In addition, you can assign the **get_site_rows** result to a variable.

When issued from the command prompt, **get_site_rows** behaves as though **query_objects** has been called to report the objects in the collection. By default, a maximum of 100 objects are displayed. You can change this maximum using the variable **collection_result_display_limit**.

For information about collections and the querying of objects, see the **collections** man page.

EXAMPLES

The following example returns a collection with all site row objects in the current design.

```
prompt> get_site_rows
{SITE_ROW#12345 SITE_ROW#12346 SITE_ROW#12347 my_row1 my_row2}
```

The following example returns a collection with two site row objects whose name is prefixed with my_row.

```
prompt> get_site_rows my_row*
{my_row1 my_row2}
```

The following example returns a collection with all site row objects in a given core area collection.

```
prompt> get_site_rows -of_objects [get_core_area]
{SITE_ROW#12345 SITE_ROW#12346 SITE_ROW#12347 my_row1 my_row2}
```

SEE ALSO

`collections(2)`
`query_objects(2)`
`collection_result_display_limit(3)`
`create_site_row(2)`
`remove_site_row(2)`
`ignore_site_row(2)`
`set_row_type(2)`
`remove_row_type(2)`

get_supply_nets

Creates a collection of supply nets that meet the specified criteria. This command is supported only in UPF mode.

SYNTAX

```
collection get_supply_nets
[-filter expression]
[-quiet]
[-regexp]
[-nocase]
[-exact]
[[patterns] [-hierarchical]
 | -of_objects objects]]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-filter *expression*

Filters the collection with *expression*. For any supply nets that match *patterns*, the expression is evaluated based on the supply net's attributes. If the expression evaluates to true, the supply net is included in the result.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the *patterns* argument as real regular expressions rather than simple wildcard patterns.

-nocase

Makes matches case-insensitive.

-exact

Disables simple pattern matching. This is used when searching for objects that contain the * and ? wildcard characters. This option is available only in UPF mode.

patterns

Matches supply net names against *patterns*. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, refer to the **wildcards** man page. The *patterns* argument and **-of_objects** option are mutually exclusive. If you do not specify either, the tool uses "*".

-hierarchical
Searches for supply nets in the current scope and all of its descendant scopes. If you specify this option, you can specify only simple names in the *patterns* argument; the name cannot contain hierarchy delimiter characters. If you do not specify this option, the tool searches for supply nets only in the current scope and you can use hierarchy delimiter characters in the *patterns* argument to specify hierarchical supply nets relative to the current scope.
You cannot specify this option when you use the **-of_objects** option. This option is available in UPF mode only.

-of_objects objects
Returns a collection of supply nets associated with the specified objects. The objects can be power domains, supply ports, or power switches. The *patterns* argument and **-of_objects** option are mutually exclusive.

DESCRIPTION

The **get_supply_nets** command creates a collection of supply nets in the current design, that match certain criteria. If no supply nets match the criteria and the design is not linked, the tools automatically links the design. If there are still no supply nets that match the criteria, an empty string is returned.

Regular expression matching is the same as in the Tcl **regexp** command. When using **-regexp**, take care in the way you quote the patterns and filter expression. Use rigid quoting with curly braces around regular expressions. Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search by adding ".*" to the beginning or end of the expressions as needed.

You can use the **get_supply_nets** command at the command prompt, or you can nest it as an argument to another command, such as **report_supply_net**. In addition, you can assign the **get_supply_nets** result to a variable.

When issued from the command prompt, **get_supply_nets** behaves as though **query_objects** has been called to display the objects in the collection. By default, a maximum of 100 objects is displayed. You can change this maximum by using the **collection_result_display_limit** variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets all supply nets under the current scope.

```
prompt> get_supply_nets -hierarchical
```

{VDD SUB_INST/VDD}

SEE ALSO

`create_supply_net(2)`
`remove_supply_net(2)`
`report_supply_net(2)`

get_supply_ports

Creates a collection of supply ports that meet the specified criteria. This command is supported only in UPF mode.

SYNTAX

```
collection get_supply_ports
[-filter expression]
[-quiet]
[-regexp [-nocase]]
[-exact]
[[patterns]
[-hierarchical] | -of_objects objects]
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>objects</i>	list

ARGUMENTS

-filter *expression*
Filters the collection with the value of the *expression* argument. For supply ports that match the specified patterns (or objects), the expression is evaluated based on the attributes of the supply port. If the expression evaluates to true, the supply port is included in the result. This option works the same way as the **filter_collection** command works. The **-regexp** and **-nocase** options are applied in the same way as in the **filter_collection** command. See the **filter_collection** man page for more information on how to use a **-filter** option in general.

-quiet
Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp
Uses the value of the *patterns* argument as a real regular expression rather than as a simple wildcard pattern.

-nocase
Makes matches case-insensitive. You can use the **-nocase** option only when you also use the **-regexp** option.

-exact
Disables simple pattern matching. Use this option when searching for objects that contain the "*" (asterisk) wildcard as an actual character.

patterns
Matches supply port names against patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark). For more details about using and escaping wildcards, refer to the **wildcards** man page.

The *patterns* argument and **-of_objects** option are mutually exclusive. If you do not specify either, the tool uses "*".

-hierarchical

Searches for supply ports in the current scope and all of its descendant scopes. When you use the **-hierarchical** option, you can specify only simple names in the *patterns* option; the name cannot contain hierarchy delimiter characters. By default, the tool searches for supply ports only in the current scope, and you can use hierarchy delimiter characters in the *patterns* option to specify hierarchical supply ports relative to the current scope. You cannot specify the **-hierarchical** option when you use the **-of_objects** option.

-of_objects objects

Returns a collection of supply ports associated with the specified objects. The objects can be power domains or supply nets.
The *patterns* argument and **-of_objects** option are mutually exclusive.

DESCRIPTION

This command creates a collection of supply ports in the current design that match certain criteria. If no supply ports match the criteria and the design is not linked, the tools automatically links the design. If there are still no supply ports that match the criteria, the command returns an empty string.

Regular expression matching in the **get_physical_lib_cells** command is the same as in the Tcl **regexp** command. When using **-regexp**, take be careful how you quote the *patterns* and filter *expression*. It is recommended that you use rigid quotation marks with curly braces around regular expressions.

Regular expressions are always anchored; that is, the expression is assumed to begin matching at the beginning of an object name and end matching at the end of an object name. You can widen the search simply by adding `.*` to the beginning or end of the expressions, as needed.

You can use the **get_supply_ports** command at the command prompt, nest it as an argument to another command (for example, **report_supply_net**), or assign the **get_supply_ports** result to a variable.

When issued from the command prompt, **get_supply_ports** behaves as if you had called **query_objects** to display the objects in the collection. By default, the command displays a maximum of 100 objects. You can change this maximum by using the **collection_result_display_limit** variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets all supply ports under the current scope.

```
prompt> get_supply_ports -hierarchical
{VN SUB_INST/VN12}
```

SEE ALSO

```
create_supply_port(2)
remove_supply_port(2)
report_supply_port(2)
```

get_terminals

Creates a collection by selecting terminals from the current design.

SYNTAX

```
collection get_terminals
[patterns
 | -of_objects port_list
 | -object_id object_id]
[-within region
 | -intersect region
 | -touching region
 | -at point]
[-filter expression]
[-regexp [-nocase] | -exact]
[-quiet]
```

Data Types

<i>patterns</i>	list
<i>port_list</i>	collection
<i>object_id</i>	integer
<i>region</i>	list of points
<i>point</i>	point
<i>expression</i>	string

ARGUMENTS

patterns

Matches the terminal names against the specified patterns. Patterns can include the wildcard characters * (asterisk) and ? (question mark) or regular expressions, depending on the use of the **-regexp** option. For more details about using and escaping wildcards, see the **wildcards** man page. Patterns can also include collections of terminals.

The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can use only one. If you do not specify any of these arguments, the command uses * (asterisk) as the pattern.

-of_objects *port_list*

Creates a collection of terminals that belong to the specified ports. Each element of the *port_list* can be a port name, port name pattern, or a port collection.

The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can use only one. If you do not specify any of these arguments, the command uses * (asterisk) as the pattern.

-object_id *object_id*

Specifies the object ID of one terminal.

The *patterns*, **-of_objects**, and **-object_id** arguments are mutually exclusive; you can use only one. If you do not specify any of these arguments, the command uses * (asterisk) as the pattern.

-within region
Creates a collection containing all terminals within the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.
The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-intersect region
Creates a collection containing all terminals that intersect the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.
The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-touching region
Creates a collection containing all terminals that touch the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.
The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-at point
Creates a collection containing all terminals that overlap the point specified by the coordinates `{x y}`.
The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-filter expression
Filters the collection with the value specified by `expression`. For any terminals that match the `patterns` argument, the expression is evaluated based on the terminal's attributes. If the expression evaluates to true, the terminal is included in the result.

-regexp
Uses the value of the `patterns` argument as a real regular expression rather than as a simple wildcard pattern. This option also modifies the behavior of the `=~` and `!~` filter operators to compare with real regular expressions,

rather than with simple wildcard patterns.

The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-nocase

Makes matches case-insensitive when you use it with the **-regexp** option. You can use the **-nocase** option only when you also use the **-regexp** option.

-exact

Disables simple pattern matching. You can use this option when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters.

The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

DESCRIPTION

This command creates a collection of terminals by selecting terminals from the current design that meet the selection criteria.

It returns a collection if one or more terminals meet the selection criteria. If no terminals match the selection criteria, it returns an empty string.

You can use the **get_terminals** command at the command prompt or nest it as an argument to another command, such as **query_objects**. You can also assign its result to a variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates a terminal collection.

```
prompt> get_terminals [list reset clock*]
{reset clock}

prompt> get_terminals -object_id 4104
{reset}
```

The following example returns the terminals within the rectangle with the lower-left corner at {2 2} and the upper-right corner at {25 25}.

```
prompt> get_terminals -within {{2 2} {25 25}}
```

```
{reset}
```

The following example gets terminals that intersect the specified polygon.

```
prompt> get_terminals \  
-intersect {{30 20} {50 20} {50 30} {40 30} {40 40} {30 40} {30 20}}  
{CCEN}
```

SEE ALSO

```
create_terminal(2)  
get_attribute(2)  
query_objects(2)  
remove_terminal(2)
```

get_text

Creates a collection of text from the current design.

SYNTAX

```
collection get_text
[-within rectangle
 | -intersect rectangle
 | -touching rectangle
 | -at point]
[-filter expression]
[-quiet]
[patterns]
```

Data Types

<i>rectangle</i>	list of points
<i>point</i>	list
<i>expression</i>	string
<i>patterns</i>	list

ARGUMENTS

-within *rectangle*

Creates a collection containing all text within the specified rectangle. The format of a rectangle specification is $\{\{llx\ lly\} \{urx\ ury\}\}$, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in technology file (usually it is microns). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-intersect *rectangle*

Creates a collection containing all text that intersects the specified rectangle. The format of a rectangle specification is $\{\{llx\ lly\} \{urx\ ury\}\}$, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in the technology file (usually it is microns). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-touching *rectangle*

Creates a collection containing all text touching the specified rectangle. The format of a rectangle specification is $\{\{llx\ lly\} \{urx\ ury\}\}$, which specifies the lower-left and upper-right corners of the rectangle. The coordinate unit is specified in the technology file (usually it is microns). The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-at *point*

Creates a collection containing all text that overlaps the point specified by the coordinates $\{x\ y\}$. The coordinate unit is specified in the technology

```

file (usually it is microns).
The -within, -intersect, -touching, and -at options are mutually exclusive;
you can specify only one.

-filter expression
    Filters the collection with expression. For any text that matches the
    patterns option, the expression is evaluated based on the text's attributes.
    If the expression evaluates to true, the text is included in the result.

-quiet
    Suppresses warning and error messages.

patterns
    Specifies the patterns of the text. The patterns can include collections of
    type text, and patterns with the format as shown in the following examples:

    * or TEXT#* removes all text
    TEXT#6400 removes one text whose object_id is 6400.
    If this argument is not specified, the command uses * (asterisk) as the
    pattern.

```

DESCRIPTION

This command creates a collection of text that meet the selection criteria. It returns a collection handle if one or more text meet the selection criteria. If no text matches the selection criteria, it returns an empty string. Use the **get_text** command as an argument to another command or assign its result to a variable. Refer to the example below for more information.

See the **collection** command man page for information about working with collections.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples show some uses of this command to create text collections.

The following example fetches the text within the specified rectangle {{10 9} {45 15}} and returns a new collection containing the found text:

```

prompt> get_text * -within {{10 9} {45 15}}
{"TEXT#6401"}

```

The following example fetches all the text in current design and returns a new collection containing two text, both of which has text string *helloworld*:

```

prompt> get_text * -filter "text == helloworld"
{"TEXT#6400", "TEXT#6401"}

```

The following example fetches the text on specified layer *m1*:

```
prompt> get_text * -filter "layer == m1"  
{ "TEXT#6400", "TEXT#6402" }
```

The following example reports warning message because there is no text that matches the specified pattern *TEXT#1234*:

```
prompt> get_text TEXT#1234  
Warning: Nothing implicitly matched 'TEXT#1234' (SEL-003)
```

<i>greater_limit</i>	float
<i>lesser_limit</i>	float

ARGUMENTS

- to *to_list*
Specifies the to pins, ports, nets, or clocks. Path endpoints are the output ports or data pins of registers. If you specify a clock, the command considers all endpoints that are constrained by the clock.
- rise_to *rise_to_list*
This option is similar to the **-to** option, but applies only to paths rising at the endpoint. If you specify a clock, this option selects the paths that are captured by the rising edge of the clock at the clock source, taking into account any logical inversions along the clock path.
- fall_to *fall_to_list*
This option is similar to the **-to** option, but applies only to paths falling at the endpoint. If you specify a clock, this option selects the paths that are captured by the falling edge of the clock at the clock source, taking into account any logical inversions along the clock path.
- from *from_list*
Specifies the from pins, ports, nets, or clocks. Path startpoints are the input ports or clock pins of registers. If you specify a clock, the command considers all startpoints clocked by the clock.
- rise_from *rise_from_list*
This option is similar to the **-from** option, but applies only to paths rising from the specified objects. If you specify a clock, this option selects the startpoints whose paths are launched by the rising edge of the clock at the clock source, taking into account any logical inversions along the clock path.
- fall_from *fall_from_list*
This option is similar to the **-from** option, but applies only to paths falling from the specified objects. If you specify a clock, this option selects the startpoints whose paths are launched by the falling edge of the clock at the clock source, taking into account any logical inversions along the clock path.
- through *through_list*
Reports only paths that pass through the named pins, ports, or clocks. If you do not use the **-through** option, the command defaults to reporting the longest path to an output port if the design has no timing constraints. If it has timing constraints, the default is to report the path with the worst slack within each path group if you do not use the **-group** option. If you use **-group**, the default is to report the path with the worst slack within the group specified by the *group_name* value.
If you specify the **-through** option only once, the tool reports only the paths that travel through one or more of the objects in the list. You can use **-through** more than once in one command invocation. For a discussion of the use of multiple **-through** options, see the *DESCRIPTION* section.
- rise_through *rise_through_list*
This option is similar to the **-through** option, but applies only to paths with a rising transition at the specified objects. You can specify **-rise_through** more than once in a single command invocation. For a discussion of multiple

-through, **-rise_through**, and **-fall_through** options, see the DESCRIPTION section.

-fall_through fall_through_list
This option is similar to the **-through** option, but applies only to paths with a falling transition at the specified objects. You can specify **-fall_through** more than once in a single command invocation. For a discussion of multiple **-through**, **-rise_through**, and **-fall_through** options, see the DESCRIPTION section.

-delay_type delay_type
Specifies the type of path delay. The valid values are **max**, **min**, **min_max**, **max_rise**, **max_fall**, **min_rise**, and **min_fall**. The rise or fall in the **delay_type** refers to a rising or falling transition at the path endpoint.

-nworst paths_per_endpoint
Gets *n* worst paths to the endpoint, where *paths_per_endpoint* is greater than or equal to 1. The default is 1, which indicates that only the worst path to an endpoint is considered. Specifying larger a larger value than 1 increases the runtime.

-max_paths max_path_count
Specifies the maximum number of paths to get per path group, where *max_path_count* is greater than or equal to 1. The default is 1.

-enable_preset_clear_arcs
Enables asynchronous preset and clear arcs for the timing path collection. By default, asynchronous timing arcs are disabled during timing verification.

-group group_name
Restricts the collection to paths in this *group_name*. Use the **group_path** or **create_clock** command to group paths.

-true
Reports the longest (least-slack) true paths in the design. This option can require a long runtime for a design that has many false paths. When you use the **-true_threshold** option, then the **-true** option returns the first path it finds greater than or equal to *path_delay*, rather than continuing to search for a longer path.
You can use the **true_delay_prove_true_backtrack_limit** and **true_delay_prove_false_backtrack_limit** variables to limit the amount of backtracking during the operation of **get_timing_paths -true**. You can use the **set_case_analysis** command to specify a partial input vector to be considered for the **-true** analysis.
The **-true** option cannot be combined with the **-max_paths(>1)**, **-nworst(>1)**, **-lesser**, **-greater**, **-slack_lesser_than**, **-slack_greater_than**, or **-delay_type** (path type other than *max*) options.

-true_threshold path_delay
Specifies a threshold path delay value, in library time units, used by the **-true** option to speed up searching. When you use the **-true_threshold** option, then the **-true** option returns the first path it finds greater than or equal to *path_delay*, rather than continuing to search for a longer path.

```

-slack_greater_than greater_slack_limit
    Selects only those paths with a slack greater than greater_slack_limit. The -slack_greater_than option can be combined with the -slack_lesser_than option to select only those paths inside or outside of a given slack range.

-slack_lesser_than lesser_slack_limit
    Selects only those paths with a slack less than lesser_slack_limit. The -slack_greater_than option can be combined with the -slack_lesser_than option to select only those paths inside or outside of a given slack range.

-greater greater_limit
    Selects only those paths that have a delay greater than the greater_limit value. The -greater and -lesser options can be combined to select only those paths inside or outside of a given delay range.

-lesser lesser_limit
    Selects only those paths that have a delay less than the lesser_limit value. The -greater and -lesser options can be combined to select only those paths inside or outside of a given delay range.

-include_hierarchical_pins
    Specifies for the returned timing paths to contain points for each hierarchical pin crossed, as well as for all leaf pins in the path. It also sets to true their hierarchical attributes. Note that clock paths are always hierarchical.

-path_type full_clock_expanded | full
    Specifies whether or not to calculate launch and capture clock paths (if they exist) for the selected paths. The valid values are full_clock_expanded and full. When you specify full_clock_expanded, the tool calculates clock paths. When you specify full, it does not calculate them. You can access the clock path data of a path (if calculated) via its launch_clock_paths and capture_clock_paths attributes.

```

DESCRIPTION

This command creates a collection of paths for custom reporting or other operations. You can use the **foreach_in_collection** command to iterate among the paths in the collection. You can use the **get_attribute** and **collection** commands to obtain information about the paths. The following attributes are supported on timing paths:

```

capture_clock_paths
clock_uncertainty
clock_path
crpr_common_point
crpr_value
endpoint
endpoint_clock
endpoint_clock_close_edge_type
endpoint_clock_close_edge_value
endpoint_clock_is_inverted
endpoint_clock_is_propagated
endpoint_clock_latency

```

```
endpoint_clock_open_edge_type
endpoint_clock_open_edge_value
endpoint_clock_pin
endpoint_hold_time_value
endpoint_is_level_sensitive
endpoint_output_delay_value
endpoint_recovery_time_value
endpoint_removal_time_value
endpoint_setup_time_value
hierarchical
launch_clock_paths
object_class
path_group
path_type
points
slack
startpoint
startpoint_clock
startpoint_clock_is_inverted
startpoint_clock_is_propagated
startpoint_clock_latency
startpoint_clock_open_edge_type
startpoint_clock_open_edge_value
startpoint_input_delay_value
startpoint_is_level_sensitive
time_borrowed_from_endpoint
time_lent_to_startpoint
```

One attribute of a timing path is the **points** collection. A point corresponds to a pin or port along the path. You can iterate through these points by using the **foreach_in_collection** command and get their attributes by using the **get_attribute** command. The following attributes are available for points of a timing path:

```
arrival
object
object_class
rise_fall
slack
```

See the **collections** and **foreach_in_collection** man pages for detailed information.

By default, the **get_timing_paths** command uses a reporting engine that can run extremely fast on large designs, especially for larger values of the **nworst** and **max_paths** arguments. For designs that have multiple timing paths with identical slack, this engine might report different paths (with the same slack value) than a previous engine that was once in use.

You can use multiple iterations of the **-through**, **-rise_though**, and **-fall_through** options in a single command to specify paths that traverse multiple points in the design. The following example specifies paths beginning at A1, passing through B1, then through C1, and ending at D1.

```
prompt> get_timing_paths -from A1\
```

get_timing_paths

934

-through B1 -through C1 -to D1

If more than one object is specified by one **-through** option, the path can pass through any of the objects. The following example specifies paths beginning at A1, passing through either B1 or B2, then passing through either C1 or C2, and ending at D1.

```
prompt> get_timing_paths -from A1 -through {B1 B2} -through {C1 C2} -to D1
```

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example prints out the startpoint name, endpoint name, and slack of the worst path in each path group.

```

proc custom_report_worst_path_per_group {} {      echo [format "%-20s %-
20s %7s" "From" "To" "Slack"]
    echo -----
    foreach_in_collection path [get_timing_paths] {          set slack [get_attribute
$path slack]
        set startpoint [get_attribute $path startpoint]
        set endpoint [get_attribute $path endpoint]
        echo [format "%-20s %-20s %s" [get_attribute $startpoint full_name] \
[get_attribute $endpoint full_name] $slack]
    }
}

```

```
prompt> custom_report_worst_path_per_group
```

From	To	Slack
ffa/CP	QA	0.1977
ffb/CP	ffd/D	3.8834

The following example shows total negative slack, total positive slack, and worst negative slack for the current design.

```

proc report_design_slack_information {} {    set design_tns 0
    set design_wns 100000
    set design_tps 0
    foreach_in_collection group [get_path_groups *] {      set group_tns 0
        set group_wns 100000
        set group_tps 0
        foreach_in_collection path [get_timing_paths -nworst 10000 -
group $group] {          set slack [get_attribute $path slack]
            if {$slack < $group_wns} {          set group_wns $slack
                if {$slack < $design_wns} {          set design_wns $slack

```

```

}
}

    if {$slack < 0.0} {
        set group_tns [expr $group_tns + $slack]
    } else {
        set group_tps [expr $group_tps + $slack]
    }
}

set design_tns [expr $design_tns + $group_tns]
set design_tps [expr $design_tps + $group_tps]
set group_name [get_attribute $group full_name]
echo [format "Group '%s' Worst Negative Slack : %g" $group_name $group_wns]
echo [format "Group '%s' Total Negative Slack : %g" $group_name $group_tns]
echo [format "Group '%s' Total Positive Slack : %g" $group_name $group_tps]
echo ""

}

echo -----
echo [format "Design Worst Negative Slack : %g" $design_wns]

```

get_tracks

Creates a collection of tracks from the current design. You can assign the return value to a variable or pass it to another command (i.e get_attribute or report_attributes).

SYNTAX

```
collection_handle get_tracks
[-within rectangle | -intersect rectangle
 | -at at_point | -touching rectangle]
[-filter expression]
[patterns | -of_objects layers]
[-quiet]
```

Data Types

at_point	point
expression	string
patterns	string
layers	list

ARGUMENTS

-within rectangle

Creates a collection containing all tracks within the specified rectangle. The format of a rectangle specification is `{{llx lly} {urx ury}}`, which specifies the lower-left and upper-right corners of the rectangle. The coordinates's unit is specified in technology file (usually it is micron).

The **-within**, **-intersect**, **-at**, and **-touching** options are mutually exclusive; you can specify only one of these options. If you do not specify any of these options, the command returns all tracks in the current design that meet the selection criteria.

-intersect rectangle

Creates a collection containing all tracks that intersect with the specified rectangle. A track intersects a rectangle if it is neither completely outside nor completely within it. The format of a rectangle specification is `{{llx lly} {urx ury}}`, which specifies the lower-left and upper-right corners of the rectangle.

The coordinates's unit is specified in technology file (usually it is micron).

The **-within**, **-intersect**, **-at**, and **-touching** options are mutually exclusive; you can specify only one of these options. If you do not specify any of these options, the command returns all tracks in the current design that meet the selection criteria.

-at at_point

Creates a collection containing all tracks that overlap the specified point. The format of a point specification is `{x y}`.

The coordinates's unit is specified in technology file (usually it is micron).

The **-within**, **-intersect**, **-at**, and **-touching** options are mutually exclusive; you can specify only one of these options. If you do not specify any of these options, the command returns all tracks in the current design that meet the selection criteria.

-touching rectangle

Creates a collection containing all tracks that touch the specified rectangle. A track touches a rectangle if it is either completely or partially within the specified rectangle. The format of a rectangle specification is {{llx lly} {urx ury}}, which specifies the lower-left and upper-right corners of the rectangle.

The coordinates's unit is specified in technology file (usually it is micron).

The **-within**, **-intersect**, **-at**, and **-touching** options are mutually exclusive; you can specify only one of these options. If you do not specify any of these options, the command returns all tracks in the current design that meet the selection criteria.

-filter expression

Filters the collection with *expression*, which must be a Boolean expression based on the following track attributes:

Attribute namesDescription

bboxThe bounding box of the track

nameName of the track

layerThe name of the layer that the track is on

directionThe wire direction of the object

countThe number of grid in a track object

spaceThe track step of the objects

startThe start position of the object

stopThe stop position of the object

The tool evaluates the expression for any tracks that matches the *patterns* argument. If the expression evaluates to true, the track is included in the result.

patterns

Matches the track names in the current design against the specified patterns. You can specify the patterns by using the following formats:

* A collection of tracks

* An asterisk (*), which indicates all tracks

* Track names, which are in the format TRACK_object_id

If you do not specify this argument, the command uses asterisk (*).

The *patterns* and **-of_objects** options are mutually exclusive. You can specify only one of two options.

-of_objects layers

Creates a collection of tracks which located on the specified layers. Each element of the layer_list can be a layer name, layer name pattern, or a layer collection.

The *patterns* and **-of_objects** options are mutually exclusive. You can specify only one of two options.

DESCRIPTION

This command returns a collection of tracks of the current design that meet the

selection criteria. You can use this command to query the tracks inside the Milkyway database by layer, by point, or by region. You can also use this command to query tracks by filtering their attributes.

EXAMPLES

The following example returns the tracks within the rectangle with the lower-left corner at {2 2} and the upper-right corner at {25 25}.

```
prompt> get_tracks * -within {{2 2} {25 25}}
{"TRACK_5389"}
```

The following example returns the tracks who is located on layer METAL2.

```
prompt> get_tracks * -filter ,Äúlayer~=METAL2"
{"TRACK_4683"}
```

The following example returns all tracks.

```
prompt> get_tracks "TRACK_*"
{"TRACK_4683 TRACK_5389"}
```

The following example shows how to use **get_attribute** to query the value of the track attributes.

```
prompt> get_attribute [get_tracks TRACK_4683] layer
METAL2
prompt> get_attribute [get_tracks TRACK_4683] bbox
{{0.000 0.000} {100.000 100.000}}
prompt> get_attribute [get_tracks TRACK_4683] start
0.000 0.000
```

To get a complete report of the attribute values of all tracks, use the **report_attribute** command, as shown in the following example.

```
prompt> report_attribute -application [get_tracks TRACK_4683]
Design Object Type Attribute Name Value
-----
CORE TRACK_4683 string bbox {0.000 0.000} {100.000 100.000}
CORE TRACK_4683 int cell_id 3
CORE TRACK_4683 string layer METAL2
CORE TRACK_4683 string name TRACK_4683
CORE TRACK_4683 string object_class track
CORE TRACK_4683 int object_id 4683
CORE TRACK_4683 string direction horizontal

get_user_grid

Gets the user grid for this session.

SYNTAX

```
status get_user_grid
[design]
```

Data Types

design string

ARGUMENTS

design

Specifies the design in which to get the user grid information. By default, the tool gets global user grid information, which is used for the default value of each successive run of this command.

DESCRIPTION

This command gets the user grid for this session of the tool. The return value is a list in the following format.

```
 {{x_offset y_offset} {x_step y_step}}
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example gets the global user grid for this session of the tool.

```
prompt> get_user_grid
{{0 0} {0.01 0.01}}
1
```

SEE ALSO

`set_user_grid(2)`

get_user_shapes

Creates a collection of one or more user shapes.

SYNTAX

```
collection get_user_shapes
[-filter expression]
[-quiet]
[-regexp [-nocase] | -exact]
[-within region
  | -intersect region
  | -touching region]
[patterns]
```

Data Types

<i>expression</i>	string
<i>region</i>	list of points
<i>patterns</i>	list

ARGUMENTS

-filter *expression*

Filters the collection with the value specified by *expression*. For any user shapes that match the *patterns* option, the expression is evaluated based on the shape's attributes. If the expression evaluates to true, the user shape is included in the result.

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the value of the *patterns* argument as a real regular expression rather than as a simple wildcard pattern. This option also modifies the behavior of the `=~` and `!~` filter operators to compare with real regular expressions, rather than with simple wildcard patterns. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-nocase

Makes matches case-insensitive when you use it with the **-regexp** option. You can use the **-nocase** option only when you also use the **-regexp** option.

-exact

Disables simple pattern matching. You can use this option when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-within *region*

Creates a collection containing only user shapes within the specified region. The region boundary can be rectangle or polygon. The valid format of a

rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{ {x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.

The **-within**, **-intersect**, and **-touching** options are mutually exclusive; you can specify only one.

`-intersect region`

Creates a collection containing only user shapes intersect the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{ {x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.

The **-within**, **-intersect**, and **-touching** options are mutually exclusive; you can specify only one.

`-touching region`

Creates a collection containing only user shapes touching the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{ {x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.

The **-within**, **-intersect**, and **-touching** options are mutually exclusive; you can specify only one.

`patterns`

Matches the user shape names against patterns in the current design. You can specify the patterns by using the following formats:

- `*` (asterisk) - allows all user shapes.
- `RECTANGLE##*` - allows rectangle user shapes.
- `RECTANGLE# object_id` - allows all rectangle user shapes that have a specified object ID.
- `TRAPEZOID##*` - allows all trapezoid user shapes.
- `TRAPEZOID# object_id` - allows all trapezoid user shapes that have a specified object ID.

Patterns can include the wildcard characters the `*` (asterisk) and `?` (question mark) wildcard characters or regular expressions, depending on the use of the **-regexp** option. For more details about using and escaping wildcards, see the **wildcards** man page.

If you do not specify either the *patterns* and **-of_objects** options, the command uses * as the pattern by default.
The *patterns* and **-of_objects** options are mutually exclusive; you can use only one.

DESCRIPTION

This command creates a collection of user shapes.

You can use the **get_user_shapes** command at the command prompt or nest it as an argument to another command, such as **query_objects**. You can also assign the **get_user_shapes** result to a variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example queries the shapes in a specified area. Although the output looks like a list, it is only a display.

```
prompt> get_user_shapes \
-within {{10.5 22.3} {32.0 40}}
{RECTANGLE#100 "TRAPEZOID#120 POLYGON#145}
```

The following example gets user shapes that intersect the specified polygon:

```
prompt> get_user_shapes \
-intersect {{30 20} {50 20} {50 30} {40 30} {40 40} {30 40} {30 20}}
{POLYGON#9936}
```

The following example queries shapes that have the specified route type. Although the output looks like a list, it is only a display.

```
prompt> get_user_shapes \
-filter {route_type=="P/G Std. Cell Pin Conn"}
{PATH#1134336 PATH#1134337 PATH#1134338 PATH#1134339 PATH#1134340}
```

SEE ALSO

`collections(2)`
`create_user_shape(2)`
`filter_collection(2)`
`get_net_shapes(2)`
`query_objects(2)`

```
remove_user_shape(2)
```

get_via_masters

Returns a name list of contact codes (via masters) defined in the current library.

SYNTAX

```
status get_via_masters
[-of_objects via_list]
-cut_layer cut_layer
-up_layer upper_layer
-low_layer lower_layer
patterns
```

Data Types

<i>via_list</i>	list
<i>cut_layer</i>	list
<i>upper_layer</i>	list
<i>lower_layer</i>	list
<i>patterns</i>	list

ARGUMENTS

- of_objects *via_list*
Gets the via master of the specified vias.
- cut_layer *cut_layer*
Creates a collection containing the via masters with the specified cut layer.
- up_layer *upper_layer*
Creates a collection containing the via masters with the specified upper layer.
- low_layer *lower_layer*
Creates a collection containing the via masters with the specified lower layer.
- patterns
Matches via master names against patterns. Patterns can include the wildcard character * (asterisk) and the ? (question mark).

DESCRIPTION

This command returns a name list of via master names that are defined in the technology file of the current library. You can use the name of a contact code in the **create_via** command to specify the master of a via.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example returns the via masters whose lower layer is METAL1.

```
prompt> get_via_masters -low_layer METAL1
VIA12 VIA12FAT
1
```

The following example returns one via master that can be used by other commands.

```
prompt> create_via -at {356 278} -no_net \
-master [get_via_masters VIA12
{"VIA#9051"}]
```

SEE ALSO

`create_via(2)`

get_vias

Creates a collection by selecting vias from the current design.

SYNTAX

```
collection get_vias
[-within region
 | -intersect region
 | -touching region
 | -at point]
[-filter expression]
[-of_objects net_list]
[-quiet]
[patterns]
```

Data Types

<i>region</i>	list
<i>point</i>	string
<i>expression</i>	string
<i>net_list</i>	list
<i>patterns</i>	list

ARGUMENTS

-within *region*

Creates a collection containing all vias within the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.

The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-intersect *region*

Creates a collection containing all vias intersect the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.

The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-touching region
Creates a collection containing all vias touching the specified region. The region boundary can be rectangle or polygon. The valid format of a rectangle is `{{llx lly} {urx ury}}` or `{llx, lly, urx, ury}`, which specifies the lower-left and upper-right corners of the rectangle. The valid format of a polygon is: `{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}`, and each `{x y}` pair specifies one point of the input polygon. Besides, a list of one polygon is also supported as input for this option, with the format: `{{{x1 y1} {x2 y2} ... {xN yN} {x1 y1}}}`. Pay attention that the valid polygon is rectilinear, so the adjacent points have one same coordinate.

The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-at point

Creates a collection containing all vias that overlap the point specified by the coordinates `{x y}`. The **-within**, **-intersect**, **-touching**, and **-at** options are mutually exclusive; you can specify only one.

-filter expression

Filters the collection with *expression*. For any vias that match the patterns option, the expression is evaluated based on the via's attributes. If the expression evaluates to *true*, the via is included in the result.
Use the **list_attributes** command to determine the via attributes.

-of_objects net_list

Creates a collection containing the vias connected to the specified nets.

-quiet

Suppresses warning and error messages.

patterns

Matches the via names against the patterns in the current design. You can specify the patterns with the following formats:

- * (asterisk) indicates all vias
- *via#** indicates all vias
- *via#7689* indicates one route shape whose object_id is 7689.

If both this argument and **-of_objects** are omitted, the command uses * (asterisk) as the pattern.

DESCRIPTION

This command creates a collection of vias by selecting vias from the current design that meet the selection criteria. It returns a collection handle if one or more vias meet the selection criteria. If no vias match the selection criteria, it returns an empty string.

Use the **get_vias** command as an argument to another command or assign its result to a

variable. Refer to the example below for more information.

See the collection command man page for information about working with collections.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples create via collections:

```
prompt> get_vias -of_objects n300
{ "VIA6766" }
```

The following examples get all vias within specified rectangle:

```
prompt> get_vias -within {{100 100} {105 105}}
{ "VIA#12345" }
```

The following example gets vias intersect specified polygon:

```
prompt>get_vias -intersect \
{{30 20} {50 20} {50 30} {40 30} {40 40} {30 40} {30 20}}
{VIA#9936 VIA#1234}
```

SEE ALSO

```
create_net_shape(2)
create_via(2)
get_attribute(2)
query_objects(2)
remove_net_shape(2)
remove_via(2)
set_via_array_size(2)
```

get_voltage_areas

Creates a collection of voltage areas from the current design.

SYNTAX

```
collection get_voltage_areas
[-quiet]
[-regexp [-nocase] | -exact]]
[-filter expression]
cell_list
```

Data Types

<i>expression</i>	string
<i>patterns</i>	list
<i>cell_list</i>	list

ARGUMENTS

-quiet

Suppresses warning and error messages if no objects match. Syntax error messages are not suppressed.

-regexp

Uses the value of the *patterns* option as a real regular expression rather than as a simple wildcard pattern. This option also modifies the behavior of the `=~` and `!~` filter operators to compare with real regular expressions, rather than with simple wildcard patterns. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-nocase

You can use the **-nocase** option only when you also use the **-regexp** option.

-exact

Disables simple pattern matching. You can use this option when searching for objects that contain the * (asterisk) and ? (question mark) wildcard characters. The **-regexp** and **-exact** options are mutually exclusive; you can use only one.

-filter *expression*

Filters the collection with the value specified by *expression*. For any voltage areas that match the *patterns* argument, the expression is evaluated based on the voltage area's attributes. If the expression evaluates to true, the voltage area is included in the result.

patterns

Matches voltage area names against patterns. Patterns can include the wildcard characters `"*"`. If this option is not specified, this command uses `,*,?*` as the default pattern.

Matches voltage area names against patterns. Patterns can include the wildcard characters the * (asterisk) and ? (question mark) wildcard characters or regular expressions, depending on the use of the **-regexp**

option. For more details about using and escaping wildcards, see the **wildcards** man page. The **-of_objects** and **patterns** options are mutually exclusive; you can use only one. By default, the command uses * (asterisk) as the *pattern*.

-of_objects *cell_list*

Creates a collection of voltage areas that contains the specified objects. The *cell_list* value should be a list of hierarchical cells. The **-of_objects** and **patterns** options are mutually exclusive; you can use only one.

DESCRIPTION

This command creates a collection of voltage areas from the current design that match certain criteria. The command returns a collection handle (identifier) if any voltage areas match the value of the **pattern** option and pass the filter (if specified). If no objects match the criteria, the command returns an empty string.

You can use the **get_voltage_areas** command at the command prompt or nest it as an argument to another command (such as **report_voltage_area**). You can also assign the **get_voltage_areas** result to a variable.

When issued from the command prompt, **get_voltage_areas** behaves as if you had called **report_voltage_area** to report the objects in the collection. By default, a maximum of 100 objects is displayed. You can change the maximum by using the **collection_result_display_limit** variable.

For information about collections and the querying of objects, see the **collections** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

`create_voltage_area(2)`
`remove_voltage_area(2)`
`report_voltage_area(2)`
`update_voltage_area(2)`

get_zero_interconnect_delay_mode

Reports whether or not the timer is currently using zero interconnect delay mode.

SYNTAX

```
status get_zero_interconnect_delay_mode
```

ARGUMENTS

None.

DESCRIPTION

This command checks the timer to determine if it is currently using zero interconnect delay mode. The command returns 1 if the timer is using zero interconnect delay mode; otherwise it returns 0.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

```
set_zero_interconnect_delay_mode(2)
```

get_zrt_net_properties

Gets the value of specified property for a net.

SYNTAX

```
status get_zrt_net_properties
-net net_name
-property property_name
```

Data Types

<i>net_name</i>	string
<i>property_name</i>	string

ARGUMENTS

```
-net net_name
    Specifies the net name from which to get the property value. This argument
    is required.

-property property_name
    Specifies the property name whose value is to be returned. This argument is
    required.
```

DESCRIPTION

The **get_zrt_net_properties** command gets the property of a specified net.

EXAMPLES

The following example gets the value of property ignore_voltage_areas:

```
prompt> get_zrt_net_properties -net "n1" -property ignore_voltage_areas
```

SEE ALSO

```
set_zrt_net_properties(2)
report_zrt_net_properties(2)
```

getenv

Returns the value of a system environment variable.

SYNTAX

```
string getenv
variable_name
```

Data Types

```
variable_name      string
```

ARGUMENTS

```
variable_name
```

Indicates the name of the environment variable to be retrieved.

DESCRIPTION

The **getenv** command searches the system environment for the specified *variable_name* and sets the result of the command to the value of the environment variable. If the variable is not defined in the environment, the command returns a Tcl error. The command is catchable.

Environment variables are stored in the Tcl array variable `env`. The environment commands **getenv**, **setenv**, and **printenv** are convenience functions to interact with this array.

The application you are running inherited the initial values for environment variables from its parent process (that is, the shell from which you invoked the application). If you set the variable to a new value using **setenv**, you see the new value within the application and within any new child processes you initiate from the application using the **exec** command. However, these new values are not exported to the parent process. Further, if you set an environment variable using the appropriate system command in a shell you invoke using the **exec** command, that value is not reflected in the current application.

See the **setB**, **unset**, and **printvarcommands** for information about dealing with non-environment variables.

EXAMPLES

In the following example, **getenv** is used to return you to your home directory.

```
prompt> set home [getenv "HOME"]
/users/disk1/bill
prompt> cd $home
prompt> pwd
/users/disk1/bill
```

In the following example, **setenv** is used to change the value of an environment variable.

```
prompt> getenv PRINTER
laser1
prompt> setenv PRINTER "laser3"
laser3
prompt> getenv PRINTER
laser3
```

In the following example, the environment variable requested is not defined. Note that the error message shows that the Tcl variable *env* was indexed with the value UNDEFINED, which resulted in an error. In the second command, **catch** was used to suppress the message.

```
prompt> getenv "UNDEFINED"
Error: can't read "env(UNDEFINED)": no such element in array
      Use error_info for more info. (CMD-013)
prompt> if {[catch {getenv "UNDEFINED"} msg]} {
            setenv UNDEFINED 1
}
```

SEE ALSO

`printenv(2)`
`printvar(2)`
`setenv(2)`

group

Creates a new level of hierarchy.

SYNTAX

```
status group
[cell_list | -logic | -pla | -fsm]
[-soft
 | -hdl_block block_name
 | -hdl_all_blocks
 | -hdl_bussed]
[-design_name design_name]
[-cell_name cell_name]
[-except exclude_list]
```

Data Types

<i>cell_list</i>	list
<i>block_name</i>	string
<i>design_name</i>	string
<i>cell_name</i>	string
<i>exclude_list</i>	list

ARGUMENTS

cell_list

Groups a list of cells in the current design into a new level of hierarchy. If more than one cell is specified, they must be enclosed in {} (braces). Cell names cannot be specified with the following options:

- logic
- pla
- fsm
- hdl_block
- hdl_all_blocks
- hdl_bussed

Note: Control logic cells (those designated as type "c" in the report displayed by using the **report_cell** command) must be grouped with the cells they are controlling.

-logic

Groups combinational cells into a new level of hierarchy. A cell is combinational if it is a leaf or library cell and its output pins have Boolean functions specified. The **-logic** option cannot be used with the *cell_list*, **-pla**, or **-fsm** option.

-pla

Groups programmable logic array (PLA) specifications in the design into a level of hierarchy. The **-pla** option cannot be used with the **-logic**, **-fsm**, or *cell_list* option. The **-pla** option is used only when the design contains blocks read as a PLA. To group combinational gates in the PLA output, use the **group** command with the **-logic -design_name** *design_name* options. After running the

compile command, the design can be written out as a PLA.

-fsm

Groups cells that are part of a finite-state machine design into a new level of hierarchy suitable for finite-state machine extraction. The sequential elements used to store the state of the finite-state machine are specified before using the **group** command by using the **set_fsm_state_vector** command. Cells in the transitive fanin or fanout of these state vector cells are grouped into the new hierarchy level. Noncombinational cells in the transitive fanin or fanout of the state vector cells are not included in the new hierarchy level. Upon completion of the group, the new design can be extracted into a state table format. This option cannot be used with the **cell_list**, **-logic** or **-pla** option.

-soft

Specifies that cells will be part of the same placement group. When you use this option, the **group** command sets the **group_name** attribute only to the selected cells, and the design hierarchy is not modified. Use the **-soft** option with the **-logic**, **-pla**, and **-fsm** options. You cannot use the **-soft** option with the **-hdl_block**, **-hdl_all_blocks**, or **-hdl_bussed** option. You can set the value of the **group_name** attribute by using the **-cell_name** option.

-hdl_block *block_name*

Groups all cells in a block created in the HDL file. The **-hdl_block** option requires that you specify the block in the HDL by using block labels. Block labels are separated by a / (slash), (for example, my_process/my_function).

-hdl_all_blocks

Groups all HDL blocks into a level of hierarchy. If you use the **-hdl_all_blocks** option alone, it recursively groups the HDL blocks in the current design. If you use it with the **-hdl_block** option, the blocks specified by the *block_name* argument are recursively grouped.

-hdl_bussed

Places each group of bused gates created from the HDL into a level of hierarchy. If you use it with the **-hdl_block** option, the blocks specified by the *block_name* argument are recursively grouped.

-design_name *design_name*

Names the design containing the new level of hierarchy. This name cannot already exist in the current design. Do not use the **-design_name** option, when you use the **-hdl_all_blocks** or **-hdl_bussed** option.

-cell_name *cell_name*

Names the instance of the new design. By default, the command generates a unique cell name. Do not use the **-cell_name** option, when you use the **-hdl_all_blocks** or **-hdl_bussed** option. Unique cell names are generated based on the **unique_cell_prefix** attribute in the current design. You can use the **get_attribute** command to obtain the value of the **unique_cell_prefix** attribute. You can set this value by using the **set_attribute** command. Note that there is no variable controlling the creation of unique cell names.

-except *exclude_list*

Specifies a list of cells in the current design to exclude from grouping. If more than one cell is specified, they must be enclosed in {}(braces). Do not

use the **-except** option with the **-hdl_block**, **-hdl_all_blocks**, or **-hdl_bussed** option.

DESCRIPTION

This command groups any number of cells or instances in the current design into a new design, creating a new level of hierarchy. The new design name must be defined by using the **-design_name** option (unless you are using the **-hdl_all_blocks** or **-hdl_bussed** option). The new design is copied into the current design.

To specify the cells to group into a new design, use one of the following options:

```
cell_list
-logic
-pla
-fsm
-hdl_block
-hdl_all_blocks
-hdl_bussed
```

Specify only one of these options (except for **-hdl_all_blocks** and **-hdl_bussed**, which can be used together or with **-hdl_block**). The **cell_list** can contain cells from anywhere in the hierarchy, but the parent of the cells in the list should be the same.

The instance name of the new design is set by using the **-cell_name** option. Otherwise, the following naming format is used:

```
cell{integer}
```

where *integer* is an integer value that ensures a unique name.

The hierarchy below a grouped block can also be grouped by issuing the **group** command specifying the new cell names.

Names for each level of hierarchy are automatically generated from the label of the grouped block. The names have the following format:

```
label_digits
```

where the *label* portion represents the label assigned to the block, and *digits* portion represents an integer that makes the name unique. **HDL_BLOCK** is the default label.

Ports in the new design are named the same as the nets to which they are connected in the current design. The direction of each port in the new design is determined for pins on the net according to the following table:

Inside pins	Outside pins	Resulting port direction
-----	-----	-----

IN	OUT	IN
OUT	IN	OUT
IN & OUT	OUT	IN
IN & OUT	IN	OUT
IN	IN & OUT	IN
OUT	IN & OUT	OUT
IN & OUT	IN & OUT	INOUT (bidir)

You can use the **-soft** option to define cell grouping constraints, which can be used by the layout placement tools and can be written to a file by using the **write_constraints** command. The **group -soft** command specifies that cells will be part of a same placement group. With this option, the **group** command sets only the **group_name** attribute for the cells in **cell_list** and the design hierarchy is not modified. You can set the value of the **group_name** attribute by using the **-cell_name** option. The **write_constraints** command reports cells with the **group_name** attribute as grouping constraints for placement tools. To remove the **group_name** attribute, use the **ungroup -soft** or **remove_attribute** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example groups two cells into a new design.

```
prompt> group {u1 u2} -design_name NEW\
-cell_name U
```

The following example groups cells with names beginning with ANALOG into a design.

```
prompt> group\
-design_name ANALOG_CELLS [get_cells ANALOG*]
```

The following example groups all cells in the HDL function named bar and process named proc into a design.

```
prompt> group -hdl_block proc/bar\
-design_name my_hdl_block
```

The following example sets the current design to the new design, and then uses the **group** command to group a nested function named **my_other_function** in the new design.

```
prompt> current_design my_hdl_block
prompt> group -hdl_block my_other_function
```

The following example groups all bused gates under the process named proc into separate levels of hierarchy (or designs).

```
prompt> group -hdl_block proc -hdl_bussed
```

The following example sets the group_name attribute to the name proc for all combinational cells. The design hierarchy is not modified.

```
prompt> group -logic -soft -cell_name proc
```

The following example creates a new hierarchy under a design named BOT with cells named A, B, and C. PROC/U1 in an instance of BOT.

```
prompt> group\  
-design_name new_design {PROC/U1/A PROC/U1/B PROC/U1/C}
```

group_path

Groups a set of paths for cost function calculations.

SYNTAX

```
int group_path
[-weight weight_value]
[-critical_range range_value]
-default | -name group_name
[-from from_list
 | -rise_from rise_from_list
 | -fall_from fall_from_list]
[-through through_list]
[-rise_through rise_through_list]
[-fall_through fall_through_list]
[-to to_list
 | -rise_to rise_to_list
 | -fall_to fall_to_list]
```

Data Types

<i>weight_value</i>	float
<i>range_value</i>	float
<i>group_name</i>	string
<i>from_list</i>	list
<i>rise_from_list</i>	list
<i>fall_from_list</i>	list
<i>through_list</i>	list
<i>rise_through_list</i>	list
<i>fall_through_list</i>	list
<i>to_list</i>	list
<i>rise_to_list</i>	list
<i>fall_to_list</i>	list

ARGUMENTS

-weight *weight_value*

Specifies a cost function weight for this group. The *weight_value* must be a number between 0.0 and 100.0. The default is 1.0. A weight of 0.0 eliminates the paths in this group from cost function calculations. Do not use very small values (for example, 0.0001); smaller values can prevent **compile** from implementing small improvements to the design. If you specify **-weight** when you add members to an existing group, the new weight for the group is used.

-critical_range *range_value*

Specifies a margin of delay for *group_name* during optimization. *range_value* must be positive or 0.0. If you don't specify a *range_value* for a group, the default is the value set with the **set_critical_range** command (the default setting is 0.0). A *range_value* of 0.0 means that only the most critical paths (the ones with the worst violation) are optimized. If you specify a nonzero *range_value*, other near-critical violating paths (one per endpoint) within that amount of the worst path are also optimized if possible. If more than

one critical path to an endpoint must be optimized, use a separate **group_path** command for each distinct critical path to that endpoint. To force **compile** to optimize all violating paths, use a very large *range_value* (larger than any expected path violations).

-default

Specifies that endpoints or paths be moved to the default group and removed from the current group. You must specify **-default** unless you use **-name**; **-name** and **-default** are mutually exclusive.

-name *group_name*

Specifies a name for the group. If a group with this name already exists, the paths or endpoints are added to that group. Otherwise, a new group is created and named *group_name*. You must specify **-name** unless you use **-default**; **-name** and **-default** are mutually exclusive.

-from *from_list*

Specifies a list of names of clocks, ports, or pins that specify path startpoints. If a clock is given, all path startpoints related to that clock are implicitly included. This includes flip-flops in the transitive fanout of the clocks source pin or port, and ports that have input delay related to the clock.

-rise_from *rise_from_list*

Same as the **-from** option, except that the path must rise from the objects specified. If a clock object is specified, this option selects startpoints clocked by the named clock, but only the paths launched by rising edge of the clock at the clock source, taking into account any logical inversions along the clock path. You can use only one of **-from**, **-rise_from**, and **-fall_from**.

-fall_from *fall_from_list*

Same as the **-from** option, except that the path must fall from the objects specified. If a clock object is specified, this option selects startpoints clocked by the named clock, but only the paths launched by falling edge of the clock at the clock source, taking into account any logical inversions along the clock path. You can use only one of **-from**, **-rise_from**, and **-fall_from**.

-through *through_list*

A list of path throughpoints (port, pin, or leaf cell names) of the current design. The path grouping applies only to paths that pass through one of the points in the *through_list*. If more than one object is included, the objects must be enclosed either in quotes or in '{}' braces. If the **-through** option is specified multiple times, the group path setting applies to paths that pass through a member of each *through_list* in the order the lists were given. In other words, the path must first pass through a member of the first *through_list*, then through a member of the second list, and so on for every through list specified. If the **-through** option is used in combination with the **-from** or **-to** options, the group path applies only if the **-from** or **-to** conditions are satisfied and the -through conditions are satisfied.

-rise_through *rise_through_list*

Same as the **-through** option, but applies only to paths with a rising transition at the specified objects. You can specify **-rise_through** more than once in a single command invocation as with the **-through** option.

-fall_through *fall_through_list*

Same as the **-through** option, but applies only to paths with a falling transition at the specified objects. You can specify **-fall_through** more than once in a single command invocation as with the **-through** option.

-to *to_list*

Specifies a list of names of clocks, ports, or pins that specify path endpoints. If a clock is given, all path endpoints related to that clock are implicitly included. This includes flip-flops in the transitive fanout of the clocks source pin or port, and ports that have output delay related to the clock.

-rise_to *rise_to_list*

Same as the **-to** option, but applies only to paths rising at the endpoint. If a clock object is specified, this option selects endpoints clocked by the named clock, but only the paths captured by rising edge of the clock at clock source, taking into account any logical inversions along the clock path. You can use only one of **-to**, **-rise_to**, and **-fall_to**.

-fall_to *fall_to_list*

Same as the **-to** option, but applies only to paths falling at the endpoint. If a clock object is specified, this option selects endpoints clocked by the named clock, but only the paths launched by falling edge of the clock at the clock source, taking into account any logical inversions along the clock path. You can use only one of **-to**, **-rise_to**, and **-fall_to**.

DESCRIPTION

Groups a set of paths or endpoints for cost function calculations. The delay cost function is the sum of all groups (weight * violation), where violation is the amount for which setup was violated for all paths within the group. If there is no violation within a group, its cost is zero. Groups enable you to specify a set of paths to optimize even though there might be larger violations in another group. When endpoints are specified, all paths leading to those endpoints are grouped.

If a clock is specified in *from_list* or *to_list*, all endpoints related to that clock are included in the group. **create_clock** automatically creates a group for a new clock with a weight of 1.0 and named the same as the clock name.

The weight of the default group is 1.0. If *weight_value* is not specified for a new group, the default is 1.0.

To undo **group_path**, use **reset_design** or **group_path -default**.

To list the path groups that are defined, use **report_path_group**. To show the maximum delay cost for each path group, use **report_constraint**.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example groups all endpoints clocked by CLK1A or CLK1B into a new group "group1" with weight = 2.0.

```
prompt> group_path -name "group1" -weight 2.0 -to {CLK1A CLK1B}
```

The following example adds OUT1 and ff34/D to the existing path group named "ADDR".

```
prompt> group_path -name "ADDR" -to {OUT1 ff34/D}
```

The following example removes OUT1 and CLK2 from existing groups and places them in the default group.

```
prompt> group_path -default -to {OUT1 CLK2}
```

This command adds all paths that first pass through either u1/Z or u2/Z then pass through u5/Z or u6/Z into the group named "blue".

```
prompt> group_path -name blue -through {u1/Z u2/Z} -through {u5/Z u6/Z}
```

The following example groups all paths from inputs I1 and I2 to outputs O5 and O7 into a group named "serious" with weight 10.0.

```
prompt> group_path -name serious -weight 10.0 -from {I1 I2} -to {O5 O7}
```

The following example groups all endpoints clocked by CLK into a group with critical range of 0.5.

```
prompt> group_path -name CLK -critical_range 0.5 -to CLK
```

The following example uses a large *range_value* to optimize all paths. For example, assume that the worst violation is expected to be 100 units. Setting a *range_value* larger than the worst violation causes **compile** to speed up all paths, as long as the transformations do not increase the worst violation (that is, make the worse path slower) for that group. In this example, the *range_value* is set higher than the worst expected violation to ensure that all violating paths are considered during optimization.

```
prompt> group_path -name CLK -critical_range 1000.0 -to CLK
```

gui_clear_filter_errors

Remove all filtering from the error list.

SYNTAX

```
string gui_clear_filter_errors
```

DESCRIPTION

Remove all filtering and restore the error set to one set by the last **gui_set_current_errors**.

EXAMPLES

The following example removes all filters:

```
gui_clear_filter_errors
```

SEE ALSO

```
gui_error_browser gui_set_current_errors gui_filter_errors
```

gui_clear_selected_errors

Clears selection in the Error Browser.

SYNTAX

```
string gui_clear_selected_errors
```

ARGUMENTS

DESCRIPTION

Clears selected errors in the Error Browser.

EXAMPLES

The following example clears selected errors:

```
gui_clear_selected_errors
```

SEE ALSO

```
gui_error_browser gui_load_error_cel gui_set_current_errors gui_set_selected_errors
```

gui_create_tk_palette_type

Create a user configurable main window palette type.

SYNTAX

```
string gui_create_tk_palette_type

    {-type type_name}
    {-title palette_title}
    {-window_types window_type_list}
    {-create_command tcl_command}
    [-dock_edge left/right/top/bottom]

string      type_name
string      palette_title
string      window_type_list
string      tcl_command
```

ARGUMENTS

-type *type_name*

Defines a name for the new palette type. If the specified name is not unique, an error occurs.

-title *palette_title*

Defines a title string to be used to describe palettes of this type. For example, context menus which control palette visibility will use the title.

-window_types *window_types*

Specifies the types of main windows that will contain the new palette type. After a palette type is defined, any new main window of the types specified are created with a palette.

-create_command *tcl_command*

Specifies a command to be called each time a main window of a type specified with *window_types* is created. The command is responsible for populating the palette with Tk control widgets. The command is called with two arguments: the name of the Tk widget to be populated and the name of the new main window.

-dock_edge *left/right/top/bottom*

Specifies the default dock edge to use when palettes of this type are created. If palettes are repositioned using the user interface, the new positions will override the default dock position the next time the application is run.

DESCRIPTION

This command defines a type of main window palette which contains a Tk widget. An instance of each defined palette type will be automatically created each time a main window of any of the specified types is instantiated. During the palette's initialization, the user's tcl command will be called to provide an opportunity for defining Tk widgets within the new palette. Creating a palette type does not cause a

palette to be created. It only specifies the parameters to be used to construct palettes of that type when main windows are subsequently created.

SEE ALSO

`gui_hide_palette(2)`, `gui_show_palette(2)`.

gui_error_browser

Show or hide the Error Browser Dialog

SYNTAX

```
string gui_error_browser [-hide | -show | -toggle]
```

ARGUMENTS

-hide

Hides the Error Browser Dialog.

-show

Shows the Error Browser Dialog. If no option flag is provided, this is the default.

-toggle

Show the Error Browser Dialog if it is currently hidden, else hide it.

DESCRIPTION

The **gui_error_browser** command controls the visibility of the Error Browser Dialog. The Error Browser Dialog displays violations recorded in an error cel by an DRC engine. This command is valid only when there is a design cel open. If the Error Browser Dialog is shown and it was not previously shown, it will automatically load error cels of default names for the currently open design cel. If the Error Browser Dialog is shown and it was previously shown, it will show the error cels last loaded.

EXAMPLES

The following example creates and shows the Error Browser Dialog:

```
gui_error_browser -show
```

SEE ALSO

gui_filter_errors

Filter the current error set with the given filter.

SYNTAX

```
string gui_filter_errors -show | -hide -selected | group GroupList
GroupList           String List
```

ARGUMENTS

-show | -hide

Mutually exclusive required option to specify whether the filtering should hide the records selected by the filter criteria or prune to the records selected by the filter criteria.

-selected | -group *GroupList*

Mutually exclusive required argument to specify whether filtering should be applied based on the selection state of error records or on the group string of the error record. **GroupList** specifies the group name list, to match against the error record group if group string match option is used.

DESCRIPTION

Applies the given filter to the current errors set by the last **gui_set_current_errors** call. You can either filter out errors matching the filter specification (use **-hide**) or prune the current errors to errors matching the filter specification (use **-show**). Filter is applied once at the time of command execution and does not set a filter mode. For example, if you hide selected errors, errors that are selected after the command executes will not become hidden.

A new filter operates on the currently visible errors in the error list and always removes errors from the list, never adds. In order to show errors that have been hidden by previous filters, first clear the filters with **gui_clear_filter_errors**, then apply new filters.

The group labels used to filter is the grouping that is not set as the current grouping. For example, if you have selected to group errors by types by setting **gui_set_error_browser_option -grouping type**, then the grouping you specify here will be interpreted as layer strings.

EXAMPLES

The following example removes selected errors from display:

```
gui_filter_errors -hide -selected
```

The following example removes unselected errors from display:

```
gui_filter_errors -show -selected
```

The following example removes errors with layer string "Met1" when errors are

grouped by error type:

```
gui_filter_errors -hide -group "Met1"
```

The following example only shows errors of type "Short" when errors are grouped by layer:

```
gui_filter_errors -show -group "Open"
```

SEE ALSO

`gui_error_browser` `gui_set_current_errors` `gui_set_selected_errors`
`gui_clear_filter_errors` `gui_set_error_browser_option`

gui_get_error_browser_option

Get Error Browser Dialog option values

SYNTAX

```
string gui_get_error_browser_option -grouping | -show_mode | -view_mode | -zoom_factor | -hide_fixed | -dim | -show_open_locator_nodes | -list_limit
```

ARGUMENTS

-grouping | -show_mode | -view_mode | -zoom_factor | -hide_fixed | -dim | -show_open_locator_nodes | -list_limit

Mutually exclusive required option to specify the Error Browser option value to query.

DESCRIPTION

This command gets the value of the requested option setting for the Error Browser. One option value can be queried at a time.

The **-grouping** option returns *type* or *layer* which indicates whether errors are grouped by types or layers.

The **-show_mode** option returns *all*, *selected*, or *none* which indicates whether all errors, selected errors, are no errors are shown in layout views.

The **-view_mode** option returns *zoom*, *pan*, or *off* which indicates whether the layout view zooms to, pans to, or does not change to the currently selected errors in the Error Browser.

The **-zoom_factor** option returns a float value between 0.1 and 10.0 and indicates the zoom factor used when the *view_mode* is *zoom*.

The **-hide_fixed** option returns *true* to mean "hidden" or *false* to mean "not hidden" and indicates whether fixed errors are hidden from display in the Error Browser and layout views.

The **-dim** option returns *true* to mean "dimmed" or *false* to mean "not dimmed" and indicates whether layout views are dimmed when errors are displayed.

The **-show_open_locator_nodes** returns *true* to mean "highlighted" or *false* to mean "not highlighted" and indicates whether net nodes are highlighted along with the open locator flylines for selected open locator errors.

The **-list_limit** returns the number of errors that are displayed at one time in the error list.

EXAMPLES

The following example gets the grouping option

```
gui_get_error_browser_option -grouping
```

The following example gets whether layout views are dimmed when errors are displayed

```
gui_get_error_browser_option -dim
```

SEE ALSO

```
gui_error_browser gui_set_error_browser_option gui_page_errors
```

gui_get_errors

Return errors in a collection.

SYNTAX

```
string gui_get_errors [-current | -visible | -selected] [-error_cel ErrorCel] | -  
error_cel_type CelType] [-id ErrObjIdList] [-fixed FixedState]  
ErrorCel           String  
CelType            String  
ErrObjIdList       Integer List
```

ARGUMENTS

[-current | -visible | -selected]

These mutually exclusive flags specify a creation of collection from errors currently displayed in the Error Browser. These options are mutually exclusive with the **-error_cel_type** plus **-id** option that allows creation of collections from error object IDs.

-current specifies that all errors in the current error set set by the last call to **gui_set_current_errors** (or the last click in the Error Browser tree view) are returned in the collection.

-visible specifies that errors currently visible in the Error Browser error list are returned. Any errors that are currently hidden due to filtering or the current fixed error visibility settings are omitted.

-selected specifies that selected errors be returned

-error_cel_type **CelType**

CelType specifies the error cel of errors to select: one of "Detail DRC", "DRC", "LVS", "Signoff DRC", "Unknown". The cel type is ignored if **-current**, **-visible** or **-selected** is given.

-error_cel **ErrorCel** | **-error_cel_type** **CelType**

These mutually exclusive options identifies an error cel. The error cel, along with the list of error IDs given with the **-id** option will uniquely identify error objects to return. The **-error_cel** option specifies with a collection of error cels and The **-error_cel_type** option specifies with the error cel type: One of "Detail DRC", "DRC", "LVS", "Signoff DRC", "Unknown". The cel specification is ignored if **-current**, **-visible** or **-selected** is given.

-id **ErrObjIdList**

ErrObjIdList is a Tcl list of error object IDs of the errors to return. The IDs along with an error cel specification will uniquely identify error objects to return. The id list is ignored if an error cel is not specified.

-fixed **FixedState**

The **-fixed** argument specifies the states, fixed or not fixed, to match. If given, only errors matching the given fixed state will be returned.

DESCRIPTION

Return a collection of error objects.

EXAMPLES

The following example sets the current errors to "Open Locator" type errors from the loaded error cel written by verify_lvs, then creates a collection of errors of these errors, then sets their "fixed" state to true:

```
gui_set_current_errors -error_cel_type LVS -group "Open Locator" set errs  
[gui_get_errors -current] gui_set_error_fixed -errors $errs -fixed true
```

The following example gets the selected errors and outputs a textual report on the errors to stdout:

```
set errs [gui_get_errors -selected] gui_report_errors -errors $errs
```

The following example gets the error with ID 209 from the loaded error cel written by Hercules, then queries the bounding boxes of these errors:

```
gui_get_error_attribute -bbox -errors [gui_get_errors -error_cel_type DRC -id 209]
```

SEE ALSO

```
gui_error_browser gui_load_error_cel gui_set_current_errors gui_set_error_fixed  
gui_filter_errors gui_get_attribute gui_set_error_browser_option
```

gui_inspect_violations

Brings up specified DFT DRC violations in a new Violation Inspector window. This command is only available in XG Mode.

SYNTAX for XG Mode

```
gui_inspect_violations
    [-type AType] AList
```

Data Types

AType	String
AList	List

ARGUMENTS

-type

This argument is used to specify the type of violation (e.g. D1) when inspecting multiple violations of same type. This is optional argument but which affects how AList is interpreted.

AList

When specified with `-type`, this can be a list of one or more violation ids to inspect. Violation ids is the violation number shown in the first column of violation Browser. When `-type` argument is not used, this specifies a single violation instance to be inspected in violation inspector. Violation instances are named in the format (similar to Tetramax) `ViolationType-ViolationId` e.g. `D1-1`.

DESCRIPTION

This command brings up specified DFT DRC violations in a new Violation Inspector window unless a Violation Inspector window has been marked for reuse. If no violation inspector window exists, a new violation inspector window is created a new top-level window. Subsequent windows are created in the active top-level window. New violation inspector window created is not marked reusable. This command is only available in XG Mode.

EXAMPLES

To inspect multiple violations (5, 9 & 13) of type D1, use:

```
gui_inspect_violations -type D1 {5 9 13}
```

To inspect a single violation 4 type D2, use:

```
gui_inspect_violations -type D2 4
or
gui_inspect_violations D2-4
```

SEE ALSO

`gui_wave_add_signal(2)`
`guiViolation_schematic_add_objects(2)`

gui_load_area_net_connection_vm

Loads the data for visual mode of net connection in an area.

SYNTAX

```
status  gui_load_area_net_connection_vm
       -area area
       [-type list_of_types]
```

Data Types

<i>area</i>	list
<i>list_of_types</i>	list

ARGUMENTS

-area *area*
Analyzes area for net connectivity.

-type *list_of_types*
Types of nets to show.
Possible types are power, ground, clock, signal, tie_high, and tie_low.
This option takes types as a list of strings.

DESCRIPTION

The command generates visual mode of net connections in a given area.
Net connection will be categorized to:

- local connection: nets have all their pins within the given area.

- global connection: nets have at least one pin outside of the given area, and one pin inside of given area.
- path-through connection: nets have all their pins outside of given area.

Nets in the visual mode are displayed based on layout view setting of net.

EXAMPLES

The following example will show clock and signal types of net connections in the specified area.

```
prompt> gui_load_area_net_connection_vm -area \
{550.710 1840.430 1247.100 2150.640} -type {clock signal}
```

SEE ALSO

None.

gui_load_cell_density_mm

Loads the data for cell density map mode.

SYNTAX

```
status gui_load_cell_density_mm
[-area area]
```

Data Types

area list

ARGUMENTS

-area area

Analyzes area for cell density. If area is not given, the default area is whole design area.

DESCRIPTION

The command generates the map mode view of cell density in a given area. Each grid is colored based on the percentage of occupied area of cells in the grid.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example will show cell density in the specified area.

```
prompt> gui_load_cell_density_mm -area \
{284.820 390.670 1202.790 954.120}
```

SEE ALSO

gui_load_cell_slack_vm

Loads the data for cell slack visual mode.

SYNTAX

```
status  gui_load_cell_slack_vm
       [-num_bins count]
       [-bin_range range]
       [-lower_bound value]
       [-lower_bound_strict]
       [-upper_bound value]
       [-upper_bound_strict]
       [-cells cell_list]
```

Data Types

<i>count</i>	integer
<i>range</i>	float
<i>value</i>	float
<i>cell_list</i>	list

ARGUMENTS

-num_bins count

Number of bins to be created.

-bin_range range

Range of each bin that is to be created
when number of bins is not specified.

gui_load_cell_slack_vm

982

-lower_bound value

Lower bound value for the bins.

Values below this bound are placed in a separate bin.

-lower_bound_strict

Uses lower bound as an exact minimum limit on the bound.

-upper_bound value

Upper bound value for the bins.

Values above this bound are placed in a separate bin.

-upper_bound_strict

Uses upper bound as an exact maximum limit on the bound.

-cells cell_list

Cells to be used in the visual mode.

If this option is not specified, all the cells in the design are used by default.

DESCRIPTION

The command generates the visual mode view of cell slack.

Each cell is colored based on the color of the bin it falls into.

EXAMPLES

The following example will place all the cells in the design into 8 bins.

```
prompt> gui_load_cell_slack_vm -num_bins 8 \
```

```
-lower_bound 0
```

The following example will place all the currently selected cells into 8 bins.

```
prompt> gui_load_cell_slack_vm -num_bins 8 \
-lower_bound 0 -cells [get_selection]
```

SEE ALSO

None.

gui_load_clock_delay_vm

Loads the data for clock latency/transition visual mode.

SYNTAX

```
status  gui_load_clock_delay_vm
       [-num_bins count]
       [-bin_range range]
       [-lower_bound value]
       [-lower_bound_strict]
       [-upper_bound value]
       [-upper_bound_strict]
       [-delay latency | transition]
       [-arrival max_early_rise | max_early_fall | max_late_rise |
        max_late_fall | min_early_rise | min_early_fall |
        min_late_rise | min_late_fall]
       -clock clock_name
```

Data Types

<i>count</i>	integer
<i>range</i>	float
<i>value</i>	float
<i>clock_name</i>	string

ARGUMENTS

-num_bins count

Number of bins to be created.

-bin_range *range*

Range of each bin that is to be created
when number of bins is not specified.

-lower_bound *value*

Lower bound value for the bins.
Values below this bound are placed in a separate bin.

-lower_bound_strict

Uses lower bound as an exact minimum limit on the bound.

-upper_bound *value*

Upper bound value for the bins.
Values above this bound are placed in a separate bin.

-upper_bound_strict

Uses upper bound as an exact maximum limit on the bound.

-delay *latency* | *transition*

Specifies whether to use latency or transition in creating
the visual mode.

-arrival *max_early_rise* | *max_early_fall* | *max_late_rise* |
max_late_fall | *min_early_rise* | *min_early_fall* | *min_late_rise*
| *min_late_fall*"
Specifies type of arrival.

-clock *clock_name*

Clock for which the visual mode is to be created.

DESCRIPTION

The command generates the visual mode view for a clock based on clock net delay type.

Each clock sink pin is colored based on the color of the bin it falls into.

EXAMPLES

The following example will place all the clock sink pins for the given clock into 8 bins based on clock latency.

```
prompt> gui_load_clock_delay_vm -num_bins 8 \
-lower_bound 0 -delay latency -clock pclk \
-arrival max_early_rise
```

SEE ALSO

None.

gui_load_clock_tree_vm

Loads the data for clock tree visual mode.

SYNTAX

```
status  gui_load_clock_tree_vm
       [-exclude_cells]
       [-exclude_nets]
       -clock_trees level_type_list
```

Data Types

level_type_list list

ARGUMENTS

-exclude_cells

Exclude the cells.

-exclude_nets

Excludes the nets.

-clock_trees *level_type_list*

List of levels and types to be colored for each clock tree. It is a list containing alternate strings of clock trees and a list that specifies the levels and types for each clock tree. The list that specifies the levels and types has two items. The first item is a list of levels. Second item is a list of types. Valid types are sink, preexisting, inverter and buffer.

Ex: {sys_clk { {0 1} {sink buffer} } ...}

DESCRIPTION

Loads the data for clock tree visual mode which colors clock trees based on the levels and types (sink, preexisting, inverter, buffer).

EXAMPLES

The following example will color levels 0 and 1, sink and preexisting gates for clock tree "sys_clk" excluding the cells.

```
prompt> gui_load_clock_tree_vm -exclude_cells \
-clock_trees { sys_clk { { 0 1 } { sink preexisting } } }
```

SEE ALSO

None.

gui_load_delta_delay_vm

Loads the data for delta delay visual mode.

SYNTAX

```
status  gui_load_delta_delay_vm
       [-nets count]
       [-delay_type max | min]
       [-num_bins count]
       [-slack value]
       [-delay value]
```

Data Types

<i>count</i>	integer
<i>value</i>	float

ARGUMENTS

-nets *count*
Number of worst nets to use.

-delay_type max | min
Specifies the type of delay to be used.

-num_bins *count*
Number of bins to be created.

-slack value

Maximum slack to be used.

-delay value

Minimum delta delay to be used.

DESCRIPTION

Loads the data for delta delay visual mode.

Delta delay visual mode colors switching (setup or hold time) noise violations on victim nets, where crosstalk-induced delay is a function of switching noise height and the transition time.

EXAMPLES

The following example will place all the nets with maximum slack 0.00 and minimum delta delay of 0.00 into 4 bins.

```
prompt> gui_load_delta_delay_vm -nets 1000 \
-delaytype max -num_bins 4 -slack 0.00 -delay 0.00
```

SEE ALSO

None.

gui_load_hierarchy_vm

Loads the data for hierarchy visual mode.

SYNTAX

```
status  gui_load_hierarchy_vm
       -clear
       -level ncount
       -cells cell_list
```

Data Types

<i>level</i>	integer
<i>cell_list</i>	list

ARGUMENTS

-clear
Removes the coloring from all hierarchy levels.

-level *level*
Colors all the cells at a particular hierarchy level.

-cells *cell_list*
Colors specific hierarchy cells.
If cells not provided, the default is cells in the entire design.

DESCRIPTION

gui_load_hierarchy_vm
992

Loads the data for hierarchy visual mode.

The hierarchy visual mode provides a high-level view of the placement quality of logic blocks and hierarchical cells in your physical design.

This visual mode can be used to color all the cells on a particular hierarchy level or just the specified hierarchical cells.

EXAMPLES

The following example clears the hierarchy visual mode.

```
prompt> gui_load_hierarchy_vm -clear
```

The following example colors all the cells at hierarchical level 2.

```
prompt> gui_load_hierarchy_vm -level 2
```

The following example colors all the cells in the selection.

```
prompt> gui_load_hierarchy_vm -cells [get_selection]
```

SEE ALSO

None.

gui_load_illegal_cell_placement_vm

Loads the data for illegal cell placement visual mode.

SYNTAX

```
status  gui_load_illegal_cell_placement_vm
```

Data Types

ARGUMENTS

DESCRIPTION

The command generates the visual mode view of illegal cell placements. Each illegal cell is colored based on the type of violation.

EXAMPLES

The following example will place all the illegal cells in the design into different bins based on the type of placement violation.

```
prompt> gui_load_illegal_cell_placement_vm
```

SEE ALSO

None.

gui_load_imported_path_pins_vm

Loads the data for imported path pins visual mode.

SYNTAX

```
status  gui_load_imported_path_pins_vm
       [-timing_report file_name]
       [-timing_text report_text]
       [-clear]
```

Data Types

<i>file_name</i>	string
<i>report_text</i>	string

ARGUMENTS

-timing_report *file_name*

Generates the imported path pins visual mode form the timing report file.

-timing_report *report_text*

Generates imported path pins visual mode from the timing report text.

-clear

Removes coloring from all pins and flylines.

DESCRIPTION

Loads the data for imported path pins visual mode.

After importing timing path data from a timing report, the imported path pins visual mode can be used to examine the pin placement and connectivity in one or more timing paths.

This visual mode colors the pins and flylines with a different color for each imported timing path.

EXAMPLES

The following example will load the timing report file "/remote/misc16/timing_report" to generate the imported path pins visual mode.

```
prompt> gui_load_imported_path_pins_vm \
-timing_report "/remote/misc16/timing_report"
```

SEE ALSO

None.

gui_load_net_capacitance_vm

Loads the data for net capacitance visual mode.

SYNTAX

```
status  gui_load_net_capacitance_vm
       [-num_bins count]
       [-bin_range range]
       [-lower_bound value]
       [-lower_bound_strict]
       [-upper_bound value]
       [-upper_bound_strict]
       [-nets net_list]
```

Data Types

<i>count</i>	integer
<i>range</i>	float
<i>value</i>	float
<i>net_list</i>	list

ARGUMENTS

-num_bins count

Number of bins to be created.

-bin_range range

Range of each bin that is to be created
when number of bins is not specified.

-lower_bound value

Lower bound value for the bins.

Values below this bound are placed in a separate bin.

-lower_bound_strict

Uses lower bound as an exact minimum limit on the bound.

-upper_bound value

Upper bound value for the bins.

Values above this bound are placed in a separate bin.

-upper_bound_strict

Uses upper bound as an exact maximum limit on the bound.

-nets net_list

Nets to be used in the visual mode.

If the nets are not provided, the default is all the nets in the design.

DESCRIPTION

The command generates the visual mode view of net capacitance.

Each net is colored based on the color of the bin it falls into
and is drawn as a flyline.

EXAMPLES

The following example will place all the nets in the design
into 8 bins.

```
prompt> gui_load_net_capacitance_vm -num_bins 8 \
```

```
gui_load_net_capacitance_vm  
998
```

```
-lower_bound 0
```

The following example will place all the nets returned by
get_nets into 8 bins.

```
prompt> gui_load_net_capacitance_vm -num_bins 8 \  
-lower_bound 0 -nets [get_nets]
```

SEE ALSO

None.

gui_load_path_slack_vm

Loads the data for path slack visual mode.

SYNTAX

```
status  gui_load_path_slack_vm
       [-num_bins count]
       [-bin_range range]
       [-lower_bound value]
       [-lower_bound_strict]
       [-upper_bound value]
       [-upper_bound_strict]
       [-paths path_list]
```

Data Types

<i>count</i>	integer
<i>range</i>	float
<i>value</i>	float
<i>path_list</i>	list

ARGUMENTS

-num_bins count

Number of bins to be created.

-bin_range range

Range of each bin that is to be created
when number of bins is not specified.

gui_load_path_slack_vm
1000

-lower_bound *value*

Lower bound value for the bins.

Values below this bound are placed in a separate bin.

-lower_bound_strict

Uses lower bound as an exact minimum limit on the bound.

-upper_bound *value*

Upper bound value for the bins.

Values above this bound are placed in a separate bin.

-upper_bound_strict

Uses upper bound as an exact maximum limit on the bound.

-paths *path_list*

Paths to be used in the visual mode.

If paths are not provided, the default is all the paths in the design.

DESCRIPTION

The command generates the visual mode view of path slack.

Each path is colored based on the color of the bin it falls into.

EXAMPLES

The following example will place all the paths in the design into 10 bins.

```
prompt> gui_load_path_slack_vm -num_bins 10 \
```

```
-lower_bound 0
```

The following example will place all the paths returned by
get_timing_paths into 10 bins.

```
prompt> gui_load_path_slack_vm -num_bins 10 \  
-lower_bound 0 -paths [get_timing_paths]
```

SEE ALSO

None.

gui_load_pin_density_mm

Loads the data for pin density map mode.

SYNTAX

```
status gui_load_pin_density_mm
[-area area]
```

Data Types

area list

ARGUMENTS

-area area
Area to be analyzed for pin density. If area option is not given, the default area is whole design area.

DESCRIPTION

The command generates map mode view of pin density in a given area. The grids are colored based on the number of pins within the grid.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example will show pin density in the specified area.

```
prompt> gui_load_pin_density_mm -area \
{284.820 390.670 1202.790 954.120}
```

SEE ALSO

gui_load_power_density_mm

Loads the data for power density map mode.

SYNTAX

```
status gui_load_power_density_mm
      -mode leakage_power | internal_power | switching_power
      | dynamic_power | total_power
```

Data Types

ARGUMENTS

```
-mode leakage_power | internal_power | switching_power
| dynamic_power | total_power"
Specifies which power density map to be loaded.
```

DESCRIPTION

Loads the data for power density map mode.

Power density maps can be used to examine power density levels in the design. This map divides the core area into a grid and colors each box to represent the power density level on a vertical plane and a horizontal plane. Each map color represents a range of power density values called a bin.

EXAMPLES

The following example will load leakage power density map.

```
prompt> gui_load_power_density_mm -mode
```

SEE ALSO

None.

gui_load_relative_placement_vm

Loads the data for relative placement visual mode.

SYNTAX

```
status  gui_load_relative_placement_vm
       [-color group | hierarchy]
       [-num_colors count]
       [-cell_only]
```

Data Types

count integer

ARGUMENTS

-color group | hierarchy

Specifies whether to color objects by relative placement group or relative placement hierarchy level.

-num_colors count

Number of colors to use in the visual mode.

-cell_only

Colors only cells.

DESCRIPTION

Loads the data for relative placement visual mode.

gui_load_relative_placement_vm

1006

Relative placement visual mode helps to examine the placement of the instances (cells and other relative placement groups) in each group. This visual mode displays a colored map of relative placement groups with a different color either for each group (by default) or for each relative placement hierarchy level.

EXAMPLES

The following example will use 11 colors to color the cells based on relative placement groups.

```
prompt> gui_load_relative_placement_vm -color_group \
-num_colors 11 -cell_only
```

SEE ALSO

None.

gui_load_scan_chain_vm

Loads the data for scan chain visual mode.

SYNTAX

```
status  gui_load_scan_chain_vm
       -chains  scan_chain_names_list
```

Data Types

scan_chain_names_list list

ARGUMENTS

-chains *scan_chain_names_list*

Loads the list of scan chains into the visual mode.

DESCRIPTION

Loads the data for scan chain visual mode.

This visual mode can be used to examine the placement of scan cells in the design once a scan is inserted. This visual mode colors each scan chain with a different color.

EXAMPLES

The following example will display the scan chains 1, 2, and 3.

```
prompt> gui_load_scan_chain_vm -chains {1 2 3}
```

SEE ALSO

None.

gui_load_static_noise_vm

Loads the data for static noise visual mode.

SYNTAX

```
status  gui_load_static_noise_vm
       [-nets count]
       [-noise_type below_high | above_low | any]
       [-num_bins count]
       [-slack value]
       [-noise value]
```

Data Types

count integer

value float

ARGUMENTS

-nets count

Number of worst nets to use.

-noise_type below_high | above_low | any

Specifies the type of noise to be used.

-num_bins count

Number of bins to be created.

gui_load_static_noise_vm

1010

-slack value

Maximum slack to be used.

-noise value

Minimum noise to be used.

DESCRIPTION

Loads the data for static noise visual mode.

This visual mode can be used to examine a high-level view of the static noise levels for routed nets in the physical design. This visual mode displays a colored map of the accumulated noise levels for routed nets in the layout view. Various colors indicate different noise value ranges.

EXAMPLES

The following example will place all the nets with maximum slack 0.00 and minimum noise of 0.00 into 4 bins.

```
prompt> gui_load_static_noise_vm -nets 1000 \
-noisetype below_high -num_bins 4 -slack 0 -noise 0
```

SEE ALSO

None.

gui_load_voltage_area_vm

Loads the data for voltage area visual mode.

SYNTAX

```
status  gui_load_voltage_area_vm
```

Data Types

ARGUMENTS

DESCRIPTION

The command generates the visual mode view of voltage areas.
Each voltage area is colored based on its type.

EXAMPLES

The following example will place all the voltage areas in the design into different bins based on their type.

```
prompt> gui_load_voltage_area_vm
```

SEE ALSO

None.

gui_page_errors

Display a new page of errors in the Error Browser

SYNTAX

```
string gui_page_errors [-page PageNumber | -next | -prev]  
PageNumber Integer
```

ARGUMENTS

-page *PageNumber*

Loads the given page of errors in the Error Browser error list if it is available. The command is a no-op if the page is not available. Page numbering begins at 1.

-next

Loads the next page of errors in the Error Browser error list if it is available. The command is a no-op if there is no next page.

-prev

Loads the previous page of errors in the Error Browser error list if it is available. The command is a no-op if there is no previous page.

DESCRIPTION

The **gui_page_errors** command controls the current set of errors displayed in the Error Browser error list. The number of errors shown in the error list at a time is set as an Error Browser option with the **gui_set_error_browser_option** command. The set of errors shown from the current error group is controlled using paging.

EXAMPLES

The following example sets the number of errors shown at a time to 2000, then shows the second 2000 errors from the current error group.

```
gui_set_error_browser_option -list_limit 2000 gui_page_errors -page 2
```

SEE ALSO

gui_error_browser **gui_set_current_errors** **gui_set_error_browser_option**

gui_report_errors

Output a textual report of errors.

SYNTAX

```
string gui_report_errors [-errors Errors] [-file FileName] [-include_hidden]  
Errors           String  
FileName        String
```

ARGUMENTS

-errors Errors

The **-errors** specifies the handle for a collection of errors to report on. This argument is optional. If omitted, a report is output for the errors currently loaded in the Error Browser error list.

[-file FileName]

FileName specifies the name of the file to write the report to. This argument is optional. If omitted, the report is output to stdout.

[-include_hidden]

-include_hidden specifies that errors that are currently hidden from the errors list due to filters or fixed errors being hidden should be included in the report. This option is ignored if errors are given with the **-errors** option.

DESCRIPTION

Ouptut a tabular textual representation of errors. If the **-errors** argument is omitted and an output file is specified, peforms the same operation as the Error Browser option menu command to save to file.

EXAMPLES

The following example saves a textual report of current errors to a file named `myErrors.txt`:

```
gui_report_errors -file "myErrors.txt"
```

The following example outputs a textual report of the fixed errors in the current error set to stdout: `set errs [gui_get_errors -fixed true] gui_report_errors -errors $errs`

SEE ALSO

```
gui_error_browser gui_load_error_cel gui_get_errors gui_set_current_errors
```

gui_set_current_errors

Sets the current error cel type and the current error group in the Error Browser.

SYNTAX

```
string gui_set_current_errors [-error_cel_type CelType] [-group Group]
CelType      String
Group       String
```

ARGUMENTS

-error_cel_type *CelType*

CelType specifies the error cel to make current, one of "Detail DRC", "DRC", "LVS", "Signoff DRC", "Unknown". The cel type may be omitted.

-group *Group*

Group specifies the group name, either a layer name or error type name, to make current. The group name may be omitted.

DESCRIPTION

Sets the current error cel type and the current error group in the Error Browser. This is analogous to selecting error cel type and group in the Error Browser tree view. By default, there are no current errors. The current errors determine the errors that are displayed in the error list and in the layout view by default.

If the error cel type option is omitted, selects the design cell, the parent of all loaded error cels. The group option is valid only when there is a single error cel specified, and raises an error if there is no error cel specified. The group string is interpreted as error type if error grouping has been set to **type**, else the group string is interpreted as layer. If the group option is omitted, all groups in the specified error cel are made current.

EXAMPLES

The following example sets error grouping by error type, loads an error cel written by verify_lvs and sets the "Open Locator" type errors as the current errors:

```
gui_set_error_browser_option -grouping type gui_load_error_cel -error_cel_type LVS
gui_set_current_errors -error_cel_type LVS -group "Open Locator"
```

The following example loads all error cels associated with the current design cell and sets the design cell as current, displaying all errors in all error cells in the error list and layout view.

```
gui_load_error_cel gui_set_current_errors
```

SEE ALSO

```
gui_error_browser gui_load_error_cel gui_set_selected_errors
```

gui_set_error_browser_option

Set Error Browser Dialog options

SYNTAX

```
string gui_set_error_browser_option [-grouping Group] [-show_mode ShowMode] [-view_mode ViewMode] [-zoom_factor ZoomFactor] [-hide_fixed DoHide] [-dim DoDim] [-show_open_locator_nodes DoShow] [-list_limit Limit]  
Group      String  
ShowMode   String  
ViewMode   String  
ZoomFactor float  
DoHide     Boolean  
DoDim     Boolean  
DoShow     Boolean  
Limit      Integer
```

ARGUMENTS

-grouping *Group*

The **-grouping** option accepts argument values *type* or *layer* and sets whether errors are grouped by types or layers. This is analogous to selecting or deselecting *Show by Layer* option in the Error Browser Options menu. By default, errors are grouped by type by default.

-show_mode *ShowMode*

The **-show_mode** option accepts argument values *all*, *selected*, or *none* and sets whether all errors, selected errors, or no errors are shown in layout views. This is analogous to making a selection from the *Show* field in the Error Browser. The default is that all errors are shown.

-view_mode *ViewMode*

The **-view_mode** option accepts argument values *zoom*, *pan*, or *off* and sets the layout view to zoom to, pan to, or not change to the currently selected errors in the Error Browser. This is analogous to making a selection from the *Follow* field in the Error Browser. The default is to zoom to the selected error.

-zoom_factor *ZoomFactor*

The **-zoom_factor** option accepts float values between 0.1 and 10.0 and sets the zoom factor used when the *view_mode* is *zoom*. The zoom factor rounds to 1/10 precision. The default value is 1.0.

-hide_fixed *DoHide*

The **-hide_fixed** option accepts Boolean values 1 or *true* to mean "hide" and 0 or *false* to mean "do not hide". The option governs whether fixed errors are hidden or shown in the Error Browser and layout views. This is analogous to selecting or deselecting *Hide Fixed Errors* option in the Error Browser Options menu. The default is that fixed errors are shown.

-dim *DoDim*

The **-dim** option accepts Boolean values 1 or *true* to mean "dim" and 0 or *false* to mean "do not dim". The option governs whether layout views are dimmed when

errors are displayed. This is analogous to checking of unchecking the *Dim* option in the Error Browser. The default is that layout views are not dimmed.

-show_open_locator_nodes *DoShow*

The **-show_open_locator_nodes** option accepts Boolean values *1* or *true* to mean "show" and *0* or *false* to mean "do not show" and governs whether net nodes are highlighted along with the open locator flylines for selected open locator errors. This is analogous to selecting or deselecting *Display Net Nodes for Selected Open Locators* option in the Error Browser Options menu. The default is to not show the net node highlights.

-list_limit *Limit*

The **-list_limit** option accepts an integer value between *500* and *10000*. It sets the number of errors that are displayed at a time in the Error Browser error list. The given value is rounded to the nearest allowable value. The default is *1000*.

DESCRIPTION

This command sets option setting for the Error Browser. Multiple option values can be set at a time.

EXAMPLES

The following example sets the grouping of errors by layers, to show all errors, and to pan to selected errors.

```
gui_set_error_browser_option -grouping layer -show_mode all -view_mode pan
```

The following example sets the option to dim layout views when errors are displayed and to hide fixed errors:

```
gui_set_error_browser_option -dim true -hide_fixed true
```

SEE ALSO

`gui_error_browser` `gui_get_error_browser_option` `gui_page_errors`

gui_set_error_fixed

Set fixed state of one or more error records.

SYNTAX

```
string gui_set_error_fixed -errors Errors -fixed FixedState
Errors           String
```

ARGUMENTS

-errors *Errors*

Errors specifies the handle for a collection of errors on which to set the fixed state.

-fixed *FixedState*

The **-fixed** argument specifies the states, fixed or not fixed, to set the state to. If 0 or false, the error state is set to "not fixed". If 1 or true, the error state is set to fixed.

DESCRIPTION

This command sets the fixed state of the given error objects to the given fixed state.

The fixed state of an error displayed in the Error Browser and an error can be hidden based on its fixed state. The state is an in-memory one with a lifetime of the error cel being loaded in the Error Browser. It is not written to the error cel. The state is a part of the textual report written to a file by `gui_report_errors`.

EXAMPLES

The following example sets errors with IDs 1108, 1304, and 1305 in the currently loaded error cel written by `verify_lvs` to "fixed" state:

```
gui_set_error_fixed -errors [gui_get_errors -error_cel_type LVS -id {1108 1304 1305}] -fixed true
```

The following example creates a collection of errors then sets their fixed state to "not fixed":

```
set errs [gui_get_errors -error_cel_type DRC -id {58 59}] gui_set_error_fixed -errors $errs -fixed false
```

SEE ALSO

`gui_error_browser` `gui_load_error_cel` `gui_get_errors` `gui_set_error_browser_option`
`gui_report_errors` `gui_toggle_fixed_selected_errors`

gui_set_selected_errors

Change selection in the Error Browser to add or repalce errors.

SYNTAX

```
string gui_set_selected_errors -add | -replace Errors
                                         String
```

ARGUMENTS

-add | -replace Errors

Mutually exclusive required option to specify errors to select and to specify whether the given errors are added to the current selection or replaces the current selection.

DESCRIPTION

Set new selected errors or add new selected errors in the Error Browser. Errors are identified with a collection of error objects. Use `gui_get_errors` command to create the collection. If **-add** is given, then the command adds the given errors to currently selected errors. If **-replace** is given, then the command replaces current selection with given errors. The command fails if the given errors are not in the current errors set by `gui_set_current_errors` (or with a click in the Error Browser tree view). Returns 1 if successful, 0 otherwise.

EXAMPLES

The following example loads all error cels associated with the current design, sets the current errors to all error types in the current loaded error cel written by `verify_lvs`, then selects error records with IDs 1108, 1304, and 1305 in the error cel:

```
gui_load_error_cel gui_set_current_errors -error_cel_type LVS
gui_set_selected_errors -replace [gui_get_errors -error_cel_type LVS -id {1108 1304 1305}]
```

The following example sets the current errors to all errors in all loaded error cels, then creates a collection of error objects with IDs 58 and 59 in the current loaded Hercules DRC error cel, then adds the errors in the collection to the current selection.

```
gui_set_current_errors set errs [gui_get_errors -error_cel_type DRC -id {58 59}]
gui_set_selected_errors -add $errs
```

SEE ALSO

```
gui_error_browser gui_load_error_cel gui_get_errors gui_set_current_errors
gui_clear_selected_errors
```

gui_show_form

Displays gui support information for one or more commands.

SYNTAX

status **gui_show_form** *pattern*

Data Types

pattern string

ARGUMENTS

pattern
Specifies the command matching pattern

DESCRIPTION

The **gui_show_form** command is used to display GUI support information for one or more commands. When the *pattern* identifies a uniquely supported command, the corresponding command dialog box will be shown. The console will also display the possible menu context (menu item, window and task) that can be used to display the command dialog box. If the *pattern* identifies multiple commands, all matching information will be presented in the manpage viewer, allowing the user to review the man page or bring up the dialog box by clicking on the appropriate area. The *pattern* can also one of the group names returned by help -groups, in which case all commands in the given group will be considered as the match.

If the uniquely identified context can not be shown, an appropriate error message will be displayed. For example, the route_area command dialog box can not be displayed, unless a design is open.

A GUI session should be active for this command to work.

The command returns successes if one or more commands are matched.

EXAMPLES

The following example shows the dialog box for the command set_route_options.

prompt> **gui_show_form set_route_options**

The following example shows information about all commands in command group routing in the manpage viewer.

prompt> **gui_show_form routing**

gui_toggle_fixed_selected_errors

Toggle the fixed state of selected errors.

SYNTAX

```
string gui_toggle_fixed_selected_errors
```

DESCRIPTION

This command toggles the fixed state of the selected error records. If any of the selected errors are not fixed, then all selected errors will be set fixed. If all of the selected errors are fixed, then all selected errors will be set not fixed.

The fixed state of an error is displayed in the Error Browser and an error record can be hidden based on its fixed state. The state is an in-memory one with a lifetime of the error cel being loaded in the Error Browser. It is not written to the error cel. The state is a part of the textual report output by `gui_report_errors`.

EXAMPLES

The following example toggles the fixed state of the currently selected errors:

```
gui_toggle_fixed_selected_errors
```

SEE ALSO

```
gui_error_browser gui_load_error_cel gui_unload_error_cel  
gui_set_error_browser_option gui_report_errors gui_set_error_fixed
```

gui_unload_error_cel

Unload an error cel from the Error Browser.

SYNTAX

```
string gui_unload_error_cel [-error_cel ErrorCel | -error_cel_type CelType]  
ErrorCel      String  
CelType       String
```

ARGUMENTS

-error_cel *ErrorCel* | -error_cel_type *CelType*

These mutually exclusive options specify the error cel to unload. **-error_cel** option specifies with a collection of error cels and **-error_cel_type** option specifies the type of error cel to unload: One of "Detail DRC", "DRC", "LVS", "Signoff DRC", "Unknown". May be omitted.

DESCRIPTION

Unloads the given error cel from the Error Browser Dialog. If cel specification is omitted, unloads all error cels from the Error Browser.

EXAMPLES

The following example unloads the error cel generated by verify_lvs.

```
gui_load_error_cel -error_cel_type LVS
```

The following examples unloads all error cels.

```
gui_load_error_cel
```

SEE ALSO

```
gui_error_browser gui_load_error_cel gui_get_loaded_error_cels
```

guiViolationSchematicAddObjects

Adds the specified signals to the waveform view of a specified violation inspector.

SYNTAX

```
guiViolationSchematicAddObjects
    [-window Awnd]
    [-clct]
    AList
```

Data Types

<i>AWnd</i>	string
<i>AList</i>	list

ARGUMENTS

-window Awnd

Adds the AList objects to the Schematic window if Awnd is valid. If there is no such violation inspector window, the command exits with an error message. If no window is specified, the objects are added to the current active window.

-clct

Implies that the command is to treat AList as a collection of object handles. If not specified, AList is treated as a list of object names.

AList

Specifies a list of object names if no **-clct** option is specified. Otherwise, the list specifies a collection of object handles. In both cases, the list can consist of heterogeneous names.

DESCRIPTION

This command adds the specified objects to the schematic view of a specified violation inspector window and selects them.

EXAMPLES

The following example adds a cell object to the active ViolationInspector Schematic window:

```
prompt> guiViolationSchematicAddObjects gate_clock
```

The following example adds a cell named *gate_clk* and a port named *i_rd* to a specified ViolationInspector.2 window:

```
prompt> guiViolationSchematicAddObjects -window violationInspector.2 \
          {gate_clk i_rd}
```

The following example adds selected objects to a specified ViolationInspector.3 window:

```
prompt> guiViolationSchematicAddObjects -window ViolationInspector.3 \
           -clct [getSelection]
```

SEE ALSO

[guiInspectViolations\(2\)](#)

gui_wave_add_signal

Adds the specified signals to a waveform view of a specified violation inspector.

SYNTAX

gui_wave_add_signal

```
[ -window Awnd]  
[ -clct]  
AList
```

Data Types

<i>Awind</i>	string
<i>AList</i>	list

ARGUMENTS

-window Awnd

Adds the signal to the WaveForm Viewer of the specified violation inspector window, if *Awnd* is valid. If there is no such violation inspector window, the command exits with an error message. If no window is specified, the signal is added to the waveform view of first ViolationInspector window created.

-clct

Implies that the command is to treat *AList* as a collection of object handles. If not, *AList* is treated as a list of object names.

AList

Specifies a list of object names if no **-clct** option is specified. Otherwise, the list specifies a collection of object handles. In both cases, the list can consist of heterogeneous names.

DESCRIPTION

This command adds specified objects to the waveform view of a specified violation inspector window. If you specify a cell, a group is created in the waveform view and all pins of the cell are added to this group as the list of signals. For a bus, all nets are added. Added objects are selected.

EXAMPLES

The following example adds a port object named *i_rd* to the first created ViolationInspector window with a waveform view:

```
prompt> gui_wave_add_signal i_rd
```

The following example adds selected objects to the given window ViolationInspector.3:

```
prompt> gui_wave_add_signal -window ViolationInspector.3 -clct [get_selection]
```

SEE ALSO

`gui_inspect_violations(2)`

gui_write_layout_image

Save a layout image in a file

SYNTAX

```
status gui_write_layout_image
-output file_name
[-window window_title]
[-view_only]
```

Data Types

file_name string
window_title string

ARGUMENTS

```
-output file_name
    Specifies the output file name, including a suffix (.jpg, .png, .xpm, or .bmp)
    that identifies format.

-window window_title
    Identifies the layout window. The defaults is the most recently used Layout
    window.

-view_only
    Writes only the layout view contents. The default is to write all of the
    layout window contents.
```

DESCRIPTION

The command `gui_write_layout_image` command writes the layout image, as seen on the screen, into a file. The image content can be the complete layout window (including layout window title, menus, menu bars and other visible toolbars docked in the layout window) or simply that of the view. The output file name must include one of supported formats as file suffix.

The supported formats are JPEG, PNG, XPM, and BMP.

This command works only in a GUI session.

EXAMPLES

The following example writes the latest layout image, excluding the layout window title, menus, and toolbars, in JPEG format to a file named `risc_core.jpg` that resides in the current directory.

```
prompt> gui_write_layout_image -view_only risc_core.jpg
```

SEE ALSO

`gui_start(2)`
`gui_stop(2)`

help

Displays quick help for one or more commands.

SYNTAX

```
string help
[-verbose] [-groups] [pattern]
```

Data Types

pattern string

ARGUMENTS

```
-verbose
    Displays options, for example "command -help".

-groups
    Displays a list of command groups only.

pattern
    Displays commands matching pattern.
```

DESCRIPTION

The **help** command is used to get quick help for one or more commands or procedures. This is not the same as **man** which displays reference manual pages for a command. There are many levels of help.

By typing the **help** command, commands are listed in paragraph format by command group. There are dedicated groups for Builtin commands and Procedures. Other groups are defined by the application.

List all of the commands in a group by typing the group name as the argument to **help**. Each command is followed by a one-line description of the command.

You can get a one-line description help for a single command by typing **help** followed by the command name. You can specify a wildcard pattern for the name. For example, all commands containing the string "alias". Finally, get syntax help for one or more commands by adding the **-verbose** option.

List only the command groups in the application by passing only the **-groups** option.

EXAMPLES

```
prompt> help
```

```
help
1030
```

```
Procedures:  
ls, sh,  
  
Builtins:  
alias, append, array, break, catch, cd, close, concat, continue  
...  
  
prompt> help Procedures  
ls # List files  
sh # Execute a shell command  
  
prompt> help a*  
alias # Create a command which expands to words.  
append # Builtin  
array # Builtin  
  
prompt> help -verbose source  
source # Read a file and execute it as a script  
[-echo] (Echo all commands)  
[-verbose] (Display intermediate results)  
file_name (Script file to read)
```

SEE ALSO

man(2)

history

Displays or modifies the commands recorded in the history list.

SYNTAX

```
string history
[-h] [-r] [args...]
```

ARGUMENTS

-h

Displays the history list without the leading numbers. You can use this for creating scripts from existing history. You can then source the script with the **source** command. You only can combine this option with a single numeric argument. Note that this option is a non-standard extension to Tcl.

-r

Reverses the order of output so that most recent history entries display first rather than the oldest entries first. You only can combine this option with a single numeric argument. Note that this option is a non-standard extension to Tcl.

DESCRIPTION

The **history** command performs one of several operations related to recently-executed commands recorded in a history list. Each of these recorded commands is referred to as an ``event''. The most commonly used forms of the command follow. You can combine each with either the **-h** or **-r** option, but not both.

- With no arguments, the **history** command returns a formatted string (intended for you to read) giving the event number and contents for each of the events in the history list.
- If a single, integer argument *count* is specified, only the most recent *count* events are returned. Note that this option is a non-standard extension to Tcl.
- Initially, 20 events are retained in the history list. You can change the length of the history list using the following:
history keep count

Tcl supports many additional forms of the **history** command. See the following ADVANCED TCL HISTORY section.

EXAMPLES

The following examples show the basic forms of the **history** command. First, you can limit the number of events shown using a single numeric argument.

```
prompt> history 3
7 set base_name "my_file"
8 set fname [format "%s.db" $base_name]
9 history 3
```

Using the **-r** option creates the history listing in reverse order.

```
prompt> history -r 3
9 history -r 3
8 set fname [format "%s.db" $base_name]
7 set base_name "my_file"
```

Using the **-h** option removes the leading numbers from each history line.

```
prompt> history -h 3
set base_name "my_file"
set fname [format "%s.db" $base_name]
history -h 3
```

ADVANCED TCL HISTORY

The **history** command performs one of several operations related to recently-executed commands recorded in a history list. Each of these recorded commands is referred to as an ‘‘event’’. When specifying an event to the **history** command, the following forms may be used:

- A number: if positive, it refers to the event with that number (all events are numbered starting at 1). If the number is negative, it selects an event relative to the current event (**-1** refers to the previous event, **-2** to the one before that, and so on). Event **0** refers to the current event.
- A string: selects the most recent event that matches the string. An event is considered to match the string either if the string is the same as the first characters of the event, or if the string matches the event in the sense of the **string match** command.

The **history** command can take any of the following forms:

history Same as **history info**, described below.

history addcommand?exec? Adds the *command* argument to the history list as a new event. If **exec** is specified (or abbreviated) then the command is also executed and

its result is returned. If **exec** isn't specified then an empty string is returned as result.

history changenewValue ?event? Replaces the value recorded for an event with *newValue*. *Event* specifies the event to replace, and defaults to the *current* event (not event **-1**). This command is intended for use in commands that implement new forms of history substitution and wish to replace the current event (which invokes the substitution) with the command created through substitution. The return value is an empty string.

history clear Erase the history list. The current keep limit is retained. The history event numbers are reset.

history event ?event? Returns the value of the event given by *event*. *Event* defaults to **-1**.

history info?count? Returns a formatted string (intended for humans to read) giving the event number and contents for each of the events in the history list except the current event. If *count* is specified then only the most recent *count* events are returned.

history keep?count? This command may be used to change the size of the history list to *count* events. Initially, 20 events are retained in the history list. If *count* is not specified, the current keep limit is returned.

history nextid Returns the number of the next event to be recorded in the history list. It is useful for things like printing the event number in command-line prompts.

history redo?event? Re-executes the command indicated by *event* and return its result. *Event* defaults to **-1**. This command results in history revision: see below for details.

HISTORY REVISION

Pre-8.0 Tcl had a complex history revision mechanism. The current mechanism is more limited, and the old history operations **substitute** and **words** have been removed. (As a consolation, the **clear** operation was added.)

The history option **redo** results in much simpler "history revision". When this option is invoked then the most recent event is modified to eliminate the history command and replace it with the result of the history command. If you want to redo an event without modifying history, then use the **event** operation to retrieve some event, and the **add** operation to add it to history and execute it.

SEE ALSO

hookup_power_gating_ports

Connects the control pins of retention registers through the design hierarchy based on the specification.

SYNTAX

```
status hookup_power_gating_ports
[-type style]
[-default_port_naming_style naming_style]
[-port_naming_styles list_of_port_naming_styles]
```

Data Types

<i>style</i>	string
<i>naming_style</i>	string
<i>list_of_port_naming_styles</i>	string

ARGUMENTS

-type *style*
Specifies the type of retention registers to be hooked up.

-default_port_naming_style *naming_style*
Specifies a single string to use as the naming style. You can embed the value of **power_gating_style** into the name with the %s reserved string, and the value of **power_gating_class** into the name through the %d reserved string. Used as an alternative to **-port_naming_styles**.

-port_naming_styles *list_of_port_naming_styles*
Specifies the names to use for ports and pins created for the design hierarchy. The argument is a list and the position in the list corresponds to the value of the power pin class, which is the first value of the **power_gating_pin** attribute. For example, to specify the ports used for stitching pins with the **power_pin_class** attribute value 1 as *FOO* and with value 2 as *BAR*, the list looks like {*FOO* *BAR*}.

DESCRIPTION

Power Compiler hooks up the control pins of retention registers through the design hierarchy either to primary input ports of the design, or to output pins of driving cells in the design. There are 2 steps in the stitching process. First, you specify the ports or pins on the design hierarchy to connect, along with the kind of control pins, and the style of retention registers. Second, stitch the control pins across the design hierarchy.

Use the **hookup_power_gating_ports** command for the second step. The command stitches the control pins of retention registers starting from the bottom and moving up. The stitching goes through hierarchical pins with compatible attributes until it reaches a port of the current design or a driver pin of a cell. If no ports or pins of compatible attributes was set by **set_power_gating_signal** command for a particular design hierarchy, the tool creates a new pin.

By default, the tool stitches the control pins of all of the retention registers in the design. On the hierarchical boundary, only the pins without the **power_gating_style** attribute are used to connect to control pins. If the **-type** option is used, only the pins of retention registers with the specified type are stitched. The hierarchical pin must also have the same attribute to connect to those control pins.

If a port or pin with compatible attributes is not found, the tool creates a new port. The **-port_naming_styles** option specifies the names to use for a port created for a design hierarchy. The value is a list of up to 5 names, and the position in the list corresponds to the value of the power pin class, the first value of the **power_gating_style** attribute.

If there is a conflict of names for the designs on the hierarchy boundary, a similar name is created. You can specify where to place the additional character the name. For example, specifying {*FOO*%s *BAR*%s} creates *FOOa* and *BARa* if there is a naming conflict. The **-default_port_naming_style** option is an alternative to **-port_naming_styles**. It can only accept one string. You can embed the value of **power_gating_style** into the name with the %s reserved string, and the value of **power_gating_class** into the name through the %d reserved string.

EXAMPLES

The following example hooks up the retention registers of the *my_style* type. If there is no port or pin with the matching attribute on any design hierarchy, a new pin named *FOO* is created for the control pins whose **power_pin_class** is 1, and another new pin named *BAR* is created for the control pins whose **power_pin_class** is 2.

```
prompt>hookup_power_gating_ports -type my_style \
    -port_naming_styles {FOO BAR}
```

The following example creates the pin or port named *FOO1* for the control pins of retention registers with a **power_pin_class** of 1, and *FOO2* for the control pins of retention registers with a **power_pin_class** of 2, etc.

```
prompt>hookup_power_gating_ports -type my_style \
    -default_port_naming_style FOO%d
```

SEE ALSO

```
report_power_gating(2)
set_power_gating_signal(2)
set_power_gating_style(2)
target_library(3)
attributes(3)
power_enable_power_gating(3)
```

hookup_retention_register

Hooks up the save and restore pins of the retention registers to the save signal and the restore signal. This command is supported only in UPF mode.

SYNTAX

```
status hookup_retention_register
```

ARGUMENTS

The **hookup_retention_register** command has no arguments.

DESCRIPTION

This command hooks up the retention register's save pin to the save signal that you specify using the the **set_retention_control** UPF command if the save pin is not hooked up. The command hooks up the retention register's restore pin to the restore signal that is you specify with the **set_retention_control** UPF command if the restore pin is not hooked up.

This command works on the entire design. It finds all of the UPF retention registers and hooks them up to the control signals.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of how to use the **hookup_retention_register** command:

```
prompt> hookup_retention_register
```

SEE ALSO

```
map_retention_cell(2)
set_retention(2)
set_retention_control(2)
```

identify_clock_gating

Identifies Power Compiler inserted clock-gating circuitry in a structural netlist.

SYNTAX

```
integer identify_clock_gating
[-reset]
[-reset_only cell_or_pin_list]
[-gating_element gating_cell]
[-gated_element gated_cell_or_pin_list]
[-ungated_element ungated_cell_list]
```

Data Types

<i>cell_or_pin_list</i>	list
<i>gating_cell</i>	cell
<i>gated_cell_or_pin_list</i>	list
<i>ungated_cell_list</i>	list

ARGUMENTS

```
-reset
    Resets all clock-gating attributes. By default, this option is off.

-reset_only cell_or_pin_list
    Resets clock-gating attributes for the specified list of cells or pins. By
    default, this option is off.

-gating_element gating_cell
    Marks the specified cell as a gating element. By default, this option is off.

-gated_element gated_cell_or_pin_list
    Marks the specified cells or pins as gated elements. By default, this option
    is off.

-ungated_element ungated_cell_list
    Marks the specified cells as cells that do not have clock gating. By default,
    this option is off.
```

DESCRIPTION

The **identify_clock_gating** command will be obsolete in a future release. Set the **power_cg_auto_identify** variable to true to activate automatic identification of clock-gating circuitry.

This command identifies the Power Compiler inserted clock-gating circuitry in the structural netlist. Identification refers to the process of detecting clock gate and the corresponding gated element association and setting different attributes on these objects. These attributes enable the later steps in the tool to work efficiently.

This command is used when the design has been written out, post-processed, and read back into the shell in the form of a structural netlist. The command is only run after technology mapping. There is no need to invoke this command if the netlist was in DDC or MilkyWay format and the clock-gating structure was not changed outside the tool.

It is considered best practice to set the correct clock-gating style by using the **set_clock_gating_style** command before invoking the **identify_clock_gating** command.

The most common usage is to invoke the command without any options. The **identify_clock_gating** command searches all of the clocks in the design for clock gates and gated cells. The tool then marks the clock-gating properties using attributes that are used by subsequent clock gating commands. Since only clocks are traversed in this case, it is important to run the **create_clock** command before running **identify_clock_gating** in this mode.

If test control pins are present on the clock gates, **identify_clock_gating** tries to reinstate the necessary attributes for the **insert_dft** command to work. The control signal is assumed to be of *scan_enable* type, unless otherwise marked as *test_mode*, by using the **set_clock_gating_style** command with the **-control_signal test_mode** options, prior to invoking **identify_clock_gating**. These attributes are applied to all the clock gates of the design that have been identified.

Use the **-gating_element** and **-gated_element** options together to mark the specified *gating_cell* as the corresponding clock gate of the *gated_elements*. If you specify only the **-gating_element** option, the command automatically detects the gated elements through netlist traversal.

Use the **report_clock_gating** command to verify the accuracy of the identification step. If there are any problems, rerun the **identify_clock_gating** command with different options to make repairs. This command does not support identification of user-inserted clock gates.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the typical flow for using the **identify_clock_gating** command to identify the clock-gating circuitry:

```
prompt> read -f verilog mapped_design.v
prompt> current_design top
prompt> link
prompt> create_clock clk
prompt> identify_clock_gating
prompt> report_clock_gating
```

The following example shows how to apply clock gating attributes to the user-inserted *user_cg1* clock gate as the corresponding clock gate of the *reg1_reg* register bank:

```
prompt> read -f verilog mapped_design.v
prompt> current_design top
prompt> link
prompt> identify_clock_gating #identify tool inserted clock gates
prompt> identify_clock_gating -gated [get_cells reg1_reg*] \
      -gating user_cg1
prompt> report_clock_gating
```

The following example shows how to apply clock gating attributes to the user-inserted *user_cg1* clock gate and allow the tool identify the corresponding registers:

```
prompt> read -f verilog mapped_design.v
prompt> current_design top
prompt> identify_clock_gating #identify tool inserted clock gates
prompt> identify_clock_gating -gating user_cg1
prompt> report_clock_gating
```

The following example shows how to use the **identify_clock_gating** command with the **report_clock_gating** command to fix problems:

```
prompt> read -f verilog mapped_design.v
prompt> current_design top
prompt> link
prompt> create_clock -per 3 clk
prompt> identify_clock_gating
prompt> report_clock_gating -gated
      # Inspect if all clock gates are identified.
      # Assume cg1 is not identified as a clock gate.
prompt> identify_clock_gating -gating cg1
prompt> report_clock_gating -gated
```

ignore_site_row

Indicates to ignore specified site rows or all site rows defined in the current design.

SYNTAX

```
string ignore_site_row
[-row row_name]
[-site site_name]
```

Data Types

<i>row_name</i>	string
<i>site_name</i>	string

ARGUMENTS

-row <i>row_name</i>	Specifies one or more rows to be ignored.
-site <i>site_name</i>	Specifies one or more sites to be ignored.

DESCRIPTION

The **ignore_site_row** command ignores site rows defined in the current design. If no row name or site name is specified, all site rows in current design will be ignored. If *site_name* is specified, all rows with the specified site name will be ignored, even if the row name is not specified.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command specifies to ignore all site rows in current design.

```
prompt> ignore_site_row
```

Each of the following commands specify to ignore all site rows in site CORE1.

```
prompt> ignore_site_row -site CORE1
prompt> ignore_site_row -row row1 -site CORE1
```

The following command specifies to ignore only row1.

```
prompt> ignore_site_row -row row1
```

SEE ALSO

`create_site_row(2)`
`report_design(2)`

`ignore_site_row`

import_designs

Imports one or more design files in Verilog or .ddc format.

SYNTAX

```
status import_designs
-format verilog | ddc
[-top design_name]
[-cell cell_filename]
[-rp_constraint tcl_script_file]
file_list
```

Data Types

<i>design_name</i>	string
<i>cell_filename</i>	string
<i>tcl_script_file</i>	string
<i>file_list</i>	list

ARGUMENTS

-format verilog | ddc
Specifies the format of a design being loaded into memory. This is a required argument.
The **verilog** format is an IEEE Standard Verilog format.
The **ddc** format is a Synopsys internal database format.

-top *design_name*
Specifies the top level module name of the design. The top level module is the module that is not instantiated by any other modules. In general, there is only one top module in a design and the **import_designs** command identify the top module automatically. If the design has multiple top level modules, you must use this option to specify one.
When importing a .ddc design file, this option specifies the current design name. By default, the current design is automatically set to the first design that is read.

-cell *cell_filename*
Specifies the cell name. The command saves the design in the database using the specified cell name. If you do not specify this option when importing design files in verilog format, the tool uses the name of the top module as the cell name. If you do not specify this option when importing a design file in .ddc format, the tool uses the name of the current design as the cell name.

-rp_constraint *tcl_script_file*
Specifies a Tcl script file to load the relative placement constraints when considering the requirements of the physical datapath flow.

file_list
Specifies a list of files to be imported. When specifying more than one files, enclose them in braces {}.

DESCRIPTION

This command imports the designs specified in the **file_list** argument. It is a wrapper of a numbers commands to perform the loading of design files, saving the design in the Milkyway database and also uniquify the design. The embedded commands in this wrapper is slightly different for importing files in verilog format than importing files in .ddc format, as shown below.

The **import_designs** command executes the following when importing design files in verilog format.

```
read_verilog          /* design is saved at this step */
uniquify_fp_mw_cel
```

The **import_designs** command executes the following when importing design files in .ddc format.

```
read_file -format ddc
current_design
link
uniquify
save_mw_cel          /* design is saved at this step */
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example imports three Verilog design files, design1.v, design2.v, and design3.v. The top module name of the design is called design_top. The design will be saved with the cell name called design_top.

```
prompt> import_designs -format verilog -top design_top -cel design_top \
           {design1.v design2.v design3.v}
prompt> save_mw_cel
```

SEE ALSO

read_verilog(2)
save_mw_cel(2)
uniquify(2)
uniquify_fp_mw_cel(2)
```

import_fp_black_boxes

Imports one or more black boxes from the hierarchy preservation information (logical view) into the physical cell.

SYNTAX

```
status import_fp_black_boxes
[-max_count num_black_box]
[-side_length length
 | -gate_count gate_count | [-utilization utilization]]
black_boxes
```

Data Types

<i>num_black_box</i>	int
<i>length</i>	float
<i>gate_count</i>	int
<i>utilization</i>	float
<i>black_boxes</i>	collection

ARGUMENTS

-max_count num_black_box

Specifies the maximum number of black boxes to be imported. The default value of **-max_count** is 100.

-side_length length

Specifies the dimension of each side of the black box in unit of microns. This is a size-related option. You cannot specify this option in conjunction with the **-gate_count**, **-utilization** options. The area of the resulting black box is *side_length* x *side_length*. The default value of **-side_length** is 300.

-gate_count gate_count

Specifies the number of equivalent gates in the black box. This is a size-related option. You may specify this option in conjunction with the **-utilization** option. The value specified must be a positive non-zero number. The default value of **-gate_count** is 0.

-utilization utilization

Specifies the utilization value for the black boxes. This is a size-related option. The value specified must be between 0.0 and 1.0 . If you specify the utilization value, you must also specify the **-gate_count** option. The default value of **-utilization** is 0.7.

black_boxes

Specifies a list of black boxes to be imported.

DESCRIPTION

This command imports one or more black boxes from the hierarchy preservation information (logical view) into the physical cell. During the loading of the verilog

design files, black boxes are flattened and needed to be restored to the physical cells to allow prototyping of these modules.

Use the size-related **-side_length**, **-gate_count**, and **-utilization** options to define the size of the black boxes. These black boxes are soft macros. Use of all 3 size-related options simultaneously is prohibited.

When you specify the **-side_length** option, the utilization value is set to 1.0 internally.

When you specify the **-utilization** option, you must also specify a non-zero value for the **-gate_count** option. The default value of the **-gate_count** option is 0.

When You can specify the **-gate_count** option by itself, the default utilization value of 0.7 is used.

If you do not specify any of the size-related options, the default side length of 300 microns is used and the utilization value is set to 1.0 internally. The area of the resulting soft macro is $300 \times 300 \text{ um}^2$.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example imports all feedthrough logical black boxes in a design:

```
prompt> set cells [get_cells -filter "is_logical_black_box==true&&\n      black_box_type==Feedthru"]\nprompt> import_fp_black_box $cells
```

SEE ALSO

```
get_cells(2)\nestimate_fp_black_boxes(2)
```

index_collection

Given a collection and an index, if the index is in range, extracts the object at that index and creates a new collection containing only that object. The base collection remains unchanged.

SYNTAX

```
collection index_collection
collection1
index
```

Data Types

<i>collection1</i>	collection
<i>index</i>	integer

ARGUMENTS

<i>collection1</i>	Specifies the collection to be searched.
<i>index</i>	Specifies the index in the collection. Allowed values are integers from 0 to sizeof_collection - 1 (minus 1).

DESCRIPTION

You can use the **index_collection** command to extract a single object from a collection. The result is a new collection containing that object.

The range of indices is from 0 to **sizeof_collection** - 1 (minus 1). If the specified index is outside that range, an error message is generated.

Commands that create a collection of objects do not impose a specific order on the collection, but they do generate the objects in the same predictable order each time. Applications that support the sorting of collections allow you to impose a specific order on a collection.

You can use the empty string for the *collection* argument. However, by definition, any index into the empty collection is invalid. So using **index_collection** with the empty collection always generates the empty collection as a result and generates an error message.

Note that not all collections can be indexed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the first object in a collection being extracted:

```
prompt> set c1 [get_cells {u1 u2}]
{"u1", "u2"}

prompt> query_objects [index_collection $c1 0]
{"u1"}
```

SEE ALSO

```
collections(2)
query_objects(2)
sizeof_collection(2)
```

infer_power_domains

Infers power domains from the \$power specification.

SYNTAX

```
status infer_power_domains
[-verbose]
```

ARGUMENTS

-verbose

Specifies to print equivalent **create_power_domain** commands as power domains are inferred.

DESCRIPTION

The **infer_power_domains** command translates \$power constructs specified in the RTL into equivalent power domains.

The \$power construct is used in the RTL to simulate the power down behavior of the circuit. Using \$power, you can specify the power domain name, signal controlling power rails of the domain, power down acknowledgment signal, and blocks in the power domain. A sense information on the power down and power acknowledgment signal can also be specified. Since sense information cannot be modeled during synthesis, the **infer_power_domains** command ignores sense information.

For more information on \$power, see the *HDL Compiler (Presto Verilog) Reference Manual* and the *HDL Compiler (Presto VHDL) Reference Manual*.

The **infer_power_domains** command can also be used to specify exception always-on paths. If a domain with primitive instances is created, and if the domain is always on (that is, if it does not have a power controlling signal associated with it), the **infer_power_domains** command marks input pins of all primitives with always-on attributes. Always-on synthesis ensures that the always-on paths are synthesized with always-on logic.

The **infer_power_domains** command traverses the design hierarchy in a top-down manner. As subdesigns are visited, it searches for \$power directives on each of the subdesigns. It then generates a unique name for the power domain, collects a power down signal, power acknowledge signal, and an instance list to generate power domains.

You can create power domains using the **create_power_domain** command and the **infer_power_domains** command.

EXAMPLES

The following example shows the creation of power domains:

```
prompt> infer_power_domain -verbose
```

```

#create_power_domain top <HardSpace\
#      -power_down -power_down_ctrl [get_nets Clk]
#create_power_domain A <HardSpace\
#      -power_down -power_down_ctrl [get_nets Clk] <HardSpace\
#      -object_list [get_cells <HardSpace\
#                      I_CONTROL <HardSpace\
#                      I_ALU <HardSpace\
#]
#create_power_domain A_0 <HardSpace\
#      -power_down -power_down_ctrl [get_nets I_PRGRM_CNT_TOP/Clk] <HardSpace\
#      -object_list [get_cells <HardSpace\
#                      I_PRGRM_CNT_TOP/I_PRGRM_FSM <HardSpace\
#]
#]
1

```

The following example creates exception always-on paths in the design:

```

infer_power_domain -verbose
#create_power_domain A <HardSpace\
#      -object_list [get_cells <HardSpace\
#                      A_INST0 <HardSpace\
#                      A_INST1 <HardSpace\
#]
#set_attribute [get_pins AN2_INST0/A] always_on TRUE
#set_attribute [get_pins AN2_INST0/B] always_on TRUE
#create_power_domain A_0 <HardSpace\
#      -power_down -power_down_ctrl [get_nets A_INST0/PD] <HardSpace\
#      -object_list [get_cells <HardSpace\
#                      A_INST0/B_INST <HardSpace\
#]
#create_power_domain A_1 <HardSpace\
#      -power_down -power_down_ctrl [get_nets A_INST1/PD] <HardSpace\
#      -object_list [get_cells <HardSpace\
#                      A_INST1/B_INST <HardSpace\
#]
#]
1

```

initialize_floorplan

Produces a floorplan with chip boundary, core, rows, and wire tracks.

SYNTAX

```
status initialize_floorplan
[-control_type aspect_ratio | width_and_height | row_number | boundary]
[-core_aspect_ratio float]
[-core_utilization float]
[-row_core_ratio float]
[-core_width float]
[-core_height float]
[-number_rows int]
[-use_vertical_row]
[-no_double_back]
[-start_first_row]
[-flip_first_row]
[-left_io2core float]
[-right_io2core float]
[-bottom_io2core float]
[-top_io2core float]
[-keep_macro_place]
[-keep_std_cell_place]
[-min_pad_height]
[-pad_limit]
[-pin_snap]
[-keep_io_place]
```

ARGUMENTS

-control_type aspect_ratio | width_and_height | row_number | boundary
Specifies a control type for the size of the core area of a floorplan. The default control type is the **aspect_ratio**.
The **aspect_ratio** control type indicates that the core area of the floorplan in the current Milkyway CEL is determined by the ratio of the height divided by the width.
The **width_and_height** control type indicates that the core area is determined by the exact width and height.
The **row_number** control type indicates that the core area is specified in terms of the number of rows.
The **boundary** control type indicates that the core area is specified by the place and route boundary of the current Milkyway CEL.

-core_aspect_ratio float
Specifies a value for the aspect ratio which is the height divided by the width.
For example, an aspect ratio of 1.00 means that the height and the width of the core area are the same and the shape of the core is a square. An aspect ratio of 3.00 means that the height is three times the width, and an aspect ratio of 0.50 means that the width is twice the height.
Note that the aspect ratio you specified is only a target. The actual core area is created as close as possible to the specified aspect ratio.

-core_utilization float
 Specifies an utilization number between 0 and 1.0. This number indicates the amount of the core area used for placement. This number is calculated as a ratio of the total cell area to the core area. The cell area includes all standard and macro cells.
 For example, a core utilization of 0.8 means that 80 percent of the core area is used for cell placement and 20 percent is available for routing. This option is only valid when the **-control_type row_number | aspect_ratio** option is specified.

-row_core_ratio float
 Specifies a number between 0 and 1.0 to indicate the amount of channel area between cell rows, reserved for routing relative to the core area. A smaller row to core ratio means that more space is left for the routing channels. A value of 1.0 means no routing channel space.
 Note that this ratio should be equal to or greater than the core utilization value.

-core_width float
 Specifies the width of the core area in user units. This option is valid only if you specify the **-control_type width_and_height** option.

-core_height float
 Specifies the height of the core area in user units. This option is valid only if you specify the **-control_type width_and_height** option.

-number_rows int
 Specifies the number of rows that comprise the core area. This option is valid only if you specify the **-control_type row_number** option.

-use_vertical_row
 Indicates that cell rows are placed vertically in the core area. If this option not specified, cell rows are placed horizontally in the core area.

-no_double_back
 Indicates that the core area does not contain pairs of cell rows with one row flipped in each pair. By default, cell rows in the core area are placed with pairing or flipping.

-start_first_row
 Indicates that the pairing of cell rows starts at the bottom of a core area with horizontally placed cell rows or the left side of a core area with vertically placed cell rows . This option is valid only if you do not specify the **-no_double_back** option.

-flip_first_row
 Indicates to flip the first row at the bottom of a core area with horizontally placed cell rows or the left side of a core area with vertically placed cell rows. This option is invalid only when the **-no_double_back** is specified.

-left_iocore float
 Specifies the distance between the left side of the core area and the right side of the closest terminal or pad.

```

-right_ioore float
    Specifies the distance between the right side of the core area and the left
    side of the closest terminal or pad.

-bottom_ioore float
    Specifies the distance between the bottom side of the core area and the top
    side of the closest terminal or pad.

-top_ioore float
    Specifies the distance between the top side of the core area and the bottom
    side of the closest terminal or pad.

-keep_macro_place
    Indicates to keep the preplaced macro cells.

-keep_std_cell_place
    Indicates to keep the preplaced standard cells.

-min_pad_height
    Indicates to set the core area based on the minimum pad height.

-pad_limit
    Indicates to place pads without spaces in between.

-pin_snap
    Indicates to snap the center of terminals to the center of the closest wire
    track.
    Note that this option does not snap power terminals, ground terminals, or
    terminals with IO constraints.

-keep_io_place
    Indicates to keep the terminal's or pad's location, even if there are IO
    constraints specified previously using the read_io_constraints command.

```

DESCRIPTION

The `initialize_floorplan` command performs floorplanning on the current Milkyway CEL. Before executing this command, you must open a physical Milkyway CEL by using the `open_mw_cel` command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example runs the `initialize_floorplan` command with the default settings:

```

prompt> open_mw_cel top -lib design
{"top"}

```

```
prompt> initialize_floorplan  
1
```

SEE ALSO

`read_io_constraints(2)`

initialize_rectilinear_block

Creates L-, T-, U-, and cross-shaped floorplans for rectilinear blocks.

SYNTAX

```
status initialize_rectilinear_block
[-shape L | T | U | X]
[-control_type ratio | length]
[-core_side_dim {side_a_dim side_b_dim side_c_dim side_d_dim [side_e_dim side_f_dim]}]
[-use_current_boundary]
[-row_core_ratio ratio_type]
[-core_utilization ratio_type]
[-orientation N | W | S | E]
[-use_vertical_row]
[-no_double_back]
[-start_first_row]
[-flip_first_row]
[-left_io2core distance]
[-right_io2core distance]
[-top_io2core distance]
[-bottom_io2core distance]
[-keep_macro_place]
[-keep_std_cell_place]
[-keep_io_place]
```

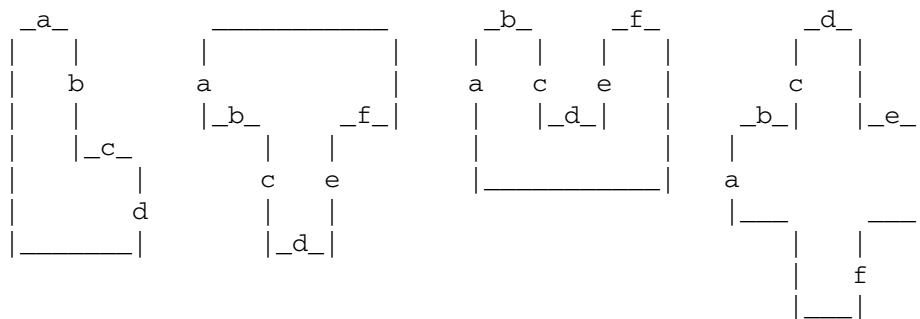

Data Types

<i>side_a_dim</i>	float >= 0.0
<i>side_b_dim</i>	float >= 0.0
<i>side_c_dim</i>	float >= 0.0
<i>side_d_dim</i>	float >= 0.0
<i>ratio_type</i>	0.0 <= float <= 1.0

ARGUMENTS

-shape L | T | U | X

Specifies a template shape used to determine the cell boundary and core shape of the rectilinear block. The following diagram shows the definition of the edges and the orientation of the L-, T-, U-, and X-shaped rectilinear blocks.

-control_type ratio | length
 Specifies how to interpret the list of dimensions provided for the **-core_side_dim** option.
 When the control type is *ratio*, each dimension in the list represents the relative proportion of the dimension of the edge to the sum of all the dimensions listed. For example, if the list of dimensions of an L-shaped block is {1 2 1 1}, the tool interprets the dimension of side a, c, or d is 20% of the sum of the dimensions listed, and the dimension of side b is 40% of the summation.
 When the control type is *length*, the dimensions in the list represent the actual physical dimensions for each edge of the polygon.

-core_side_dim {side_a_dim side_b_dim side_c_dim side_d_dim [side_e_dim side_f_dim]}
 Specifies the dimensions of the edges of the rectilinear block. This list contains a maximum of 6 values, depending on the shape specified by the **-shape** option. The semantics of the values depends on the **-control_type** option specified. If you provide more values than needed to describe the specified shape, the extra values are ignored. If you do not provide all the values needed to describe the specified shape, the tool issues an error.

-use_current_boundary
 Uses the rectilinear boundary that is already defined. You should have defined the boundary using either the **initialize_rectilinear_block -shape** command or the **create_boundary -poly** command. This option is invalid if the existing boundary is rectangular.

-row_core_ratio ratio_type
 Specifies a number between 0 and 1.0 to indicate the amount of routing area between cell rows relative to the core area. A smaller row to core ratio means that more space is reserved for the routing channels. A value of 1.0 means no routing channel space.
 Note that this ratio must be equal to or greater than the core utilization value.

-core_utilization ratio_type
 Specifies an utilization number between 0 and 1.0. This number indicates the amount of the core area used for cell placement. This number is calculated as a ratio of the total cell area to the core area. The cell area is the total area of all standard and macro cells.
 For example, a core utilization of 0.8 means that 80 percent of the core area is used for cell placement and 20 percent is available for routing.

-orientation N | W | S | E
 Specifies one of the four possible orientations for the specified rectilinear shape. The tool repositions the block to the specified orientation by rotating it in a clockwise direction.

-use_vertical_row
 Indicates to cut standard cell rows vertically in the core area. If you do not specify this option, cell rows in the core area are cut in horizontal fashion.

-no_double_back
 Disables the use of the back-to-back style of row pairs of cell rows. By default, cell rows are cut in a back-to-back pairing format.

```

-start_first_row
    Indicates that the first row is part of the back-to-back pair. This option
    is valid only when you do not specify the -no_double_back option.

-flip_first_row
    Indicates that the first row is cut in a flipped orientation causing the back-
    to-back pairs to share power or ground rails in an alternate style. This
    option is valid only when you do not specify the -no_double_back option

-left_ioore distance
    Specifies the shortest distance between the IO pin and the left side of the
    core boundary.

-right_ioore distance
    Specifies the shortest distance between the IO pin and right side of the core
    boundary.

-top_ioore distance
    Specifies the shortest distance between the IO pin and the top side of the
    core boundary.

-bottom_ioore distance
    Specifies the shortest distance between the IO pin and the bottom side of the
    core boundary.

-keep_macro_place
    Indicates to keep the preplaced macro cells.

-keep_std_cell_place
    Indicates to keep the preplaced standard cells.

-keep_io_place
    Indicates to keep the current placement of the I/O pins. This option is valid
    only when you specify the -use_current_boundary option.

```

DESCRIPTION

The initialize_rectilinear_block command creates L-, T-, U- and cross-shaped floorplans for these rectilinear blocks. This command leaves all I/O pins at the origin. Optionally it can leave previously placed I/O pins in their current location.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates an L-shaped core with a core area computed with a core_utilization factor of 0.8. Each core bounding box edge will be at an offset of 10 microns from the core boundary. The core contains cell rows without routing channel space.

```
prompt> initialize_rectilinear_block -shape L -control_type ratio \
    -core_side_dim {50 50 50 50} \
    -core_utilization 0.8 -row_core_ratio 1.0 \
    -left_io2core 10 \
    -top_io2core 10 \
    -right_io2core 10 \
    -bottom_io2core 10
```

SEE ALSO

insert_buffer

Inserts buffer cells on nets connected to specified pins.

SYNTAX

```
collection insert_buffer
[-new_net_names new_net_names]
[-new_cell_names new_cell_names]
[-no_of_cells number]
[-inverter_pair]
[-repeater_distance distance_between [-tolerance length]]
[-divide_load_by denominator [-ignore_pin_cap]]
[-port_half_distance]
[-location coordinate_list]
[-on_route]
[-orientation orientation_list]
object_list
buffer_lib_cell
```

Data Types

<i>new_net_names</i>	list
<i>new_cell_names</i>	list
<i>number</i>	integer
<i>distance_between</i>	float
<i>length</i>	float
<i>denominator</i>	float
<i>coordinate_list</i>	list
<i>orientation_list</i>	list
<i>object_list</i>	list
<i>buffer_lib_cell</i>	collection

ARGUMENTS

-new_net_names *new_net_names*

Specifies the names of the new nets that are inserted. You must specify one net name per buffer when inserting buffers. You must specify two net names per inverter pairs when inserting inverter pairs. If the specified net name is already present, the command adds a suffix of `"_%d"` or `"_%d_%d"`. Optionally you can specify only the common base name and new net names will be generated by adding unique numeric suffixes to the common base name. The names specified can be any valid net names, but must be the leaf names. They must not be the hierarchical names. The names must not contain embedded hierarchical separators and must be unique in the current context as specified by the current instance. By default, the command uses the base name `eco_net`.

-new_cell_names *new_cell_names*

Specifies the names of the new cells that are inserted. You must specify one cell name per buffer when inserting buffers. You must specify two cell names per inverter pairs when inserting inverter pairs. If the specified cell name is already present, the command adds a suffix of `"_%d"` or `"_%d_%d"`. Optionally you can specify only the common base name and the new cell names will be

generated by adding unique numeric suffixes to the common base name. These names can be any valid cell names, but must be the leaf names. They must not be the hierarchical names. The new names must not contain embedded hierarchical separators and must be unique in the current context, as specified by the current instance. By default, the command uses the common base name `eco_cell`.

-no_of_cells *number*

Specifies the number of buffer cells or inverter pairs to be introduced. The repeaters introduced will be connected back to back in series. By default, the command introduces single buffer cell or inverter pair.

The **-no_of_cells**, **-divide_load_by**, and **-repeater_distance** options are mutually exclusive.

-inverter_pair

Indicates that a pair of inverting library cells has to be inserted instead of a single non-inverting library cell. If you specify this option, you need to supply a library cell with an inverting output for the **-buffer_lib_cell** option. You can use this option when the library cell (buffer) specified has both inverting and non-inverting outputs.

-repeater_distance *distance_between*

Specifies the distance between each buffer to be introduced along the route. The value specified for *distance_between* should be in units of micron. This option always works on the entire physical route underlying the nets or pins specified. If you specify a net in the middle of the hierarchy, this option will find the driver of the net, possibly in another level of hierarchy, and buffer the entire set of logical nets associated with the physical route. Buffers are not inserted into ILMs.

The **-repeater_distance** option can only be used in conjunction with the **-on_route** option. The **-repeater_distance**, **-no_of_cells**, and **-divide_load_by** options are mutually exclusive.

-tolerance *length*

Specifies an incremental distance between each buffer to be introduced along a route. The value specified for *length* should be in units of micron. You can use this option only if you also use the **-repeater_distance** option. The *length* value is added to the *distance_between* value of the **-repeater_distance** option. This option provides a convenience way to adjust the value of the **-repeater_distance** incrementally per command.

-divide_load_by *denominator*

Enables the buffering of a net such that resulting nets after buffer insertion, have a load no more than the original load divided by the specified *denominator*. The valid values of *denominator* are any integer greater than or equal to **2**. This option always works on the entire physical route underlying the nets specified. If you specify a net in the middle of the hierarchy, this option will find the driver of the net, possibly in another level of hierarchy, and buffer the entire set of logical nets associated with the physical route. Buffers are not inserted into ILMs.

Use the **-divide_load_by** option only in conjunction with the **-on_route** option. The **-divide_load_by**, **-no_of_cells**, and **-repeater_distance** options are mutually exclusive.

-ignore_pin_cap
Considers only the net capacitance when buffering the net. The tool ignores the pin capacitance. You can use this option only if you also use the **-divide_load_by** option. If you do not use the **-ignore_pin_cap** option, the processing of the **-divide_load_by** option considers net capacitance and pin capacitance.

-port_half_distance
Indicates that some external routing is assumed while processing the **-repeater_distance** option. Assuming half of the repeater_distance value is the routing distance outside each top-level port, the tool places a buffer half the distance from the port on long nets. From then on, the full repeater_distance is used. You can use this option only if you also use the **-repeater_distance** option.

-location coordinate_list
Specifies the lower left coordinates for the locations of the buffer or inverter pair cells, in the format {x1 y1 x2 y2 ...}. You must specify one location per buffer when inserting buffers. You must specify two locations per inverter pair when inserting inverter pairs. These locations can be any valid x-y coordinate pair inside the placement region of the core area, relative to the chip origin. Specify the coordinates in units of microns. By default, the tool derives locations for the buffers based on the pins specified for the **object_list** option.

-on_route
Places buffer or inverter cells along the route of the net. If the command is introducing multiple cells, then it spreads them along the path of the route that is common to the given **object_list**. This option is effective only on routed and extracted designs.
You can use the **-on_route**, **-repeater_distance**, and **-divide_load_by** options together to use the distance based or the load based buffer insertion along the route. This option also controls the recording of the modified nets for the **split_net** command. See **split_net** man page for more details.

-orientation orientation_list
Specifies the orientation of the buffer cells or inverter pairs. You must specify one orientation per buffer when inserting buffers. You must specify two orientations per inverter pair when inserting inverter pairs. These orientations can be any valid orientation allowed in the library, for example, N, W, S, E, FN, FW, FS, or FE. By default, the command uses the N orientation.

object_list
Specifies a list of nets, pins, or ports that must be buffered. The new buffer cells or inverter pairs are placed close to the specified pins or ports. If you specify a net, the tool connects buffer or inverter pairs such that a new buffer cell is the new load of the original net. If you specify pins, the tool groups all the specified pins based on the nets to which they are connected. When the grouped pins are load pins, the buffers are introduced such that the new buffer cells drive them. When the grouped pins are driver pins, the new buffer cells are connected such that they become the load of the specified driver pin.

```
buffer_lib_cell
    Specifies the library cell object to be used as buffer. In this case, the
    object is either a named library cell or a library cell collection. If the
    library cell is a buffer cell, the number of instances of buffers introduced
    is equal to the number specified by the -no_of_cells option. If the library
    cell is an inverter, the number of instances of inverters introduced is twice
    the number specified by -no_of_cells.
    If the library cell has both inverting and non-inverting outputs (that is,
    it can act both as a buffer or an inverter), the -inverter_pair option
    controls which output is used. If the library cell has multiple outputs, the
    command uses the first non-inverting or inverting output.
```

DESCRIPTION

This command adds buffers at one or more specified pins or ports. A library cell with a single input and multiple outputs is a buffer, as long as each output has the same or inverted logic function as the input.

Like all other netlist editing commands, for the **insert_buffer** command to succeed, all of its arguments must be valid. If any argument specified is invalid, the netlist remains unchanged. If the command succeeds, the result is a collection of the newly inserted cells. If the command fails, the result is an empty collection or an empty string.

By default, each newly created cell has a name beginning with the `eco_cell` string and ending with a unique numeric suffix. Each newly created net has a name beginning with the `eco_net` string and ending with a unique numeric suffix. To override the automatic name generation by the tool, use the **-new_net_names** and **-new_cell_names** options.

Note that the locations of the new cells specified by the **-location** option or the locations derived by the tool, are not legalized. If you use the **legalize_placement** command after using the **insert_buffer** command, the tool may move these new cells around to find a legal locations.

You can mimic buffer insertion using other commands such as **create_cell**, **create_net**, **disconnect_net**, and **connect_net**, but the **insert_buffer** command provides a more efficient and fail safe way to insert buffers.

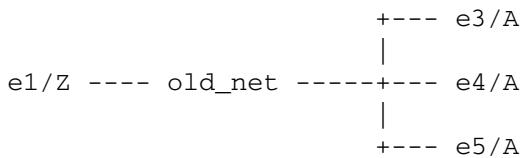

The **insert_buffer** command uses the following basic rules to check its arguments for validity:

- The pin or port must be in scope at or below the current instance. For a description of some special scoping rules, see the Buffering Inside Boundary Pins section.
- The pin or port must be connected to a net.
- Bidirectional pins cannot be buffered.
- The `lib_cell` cannot be sequential.
- The `lib_cell` must be a buffer, as previously defined.

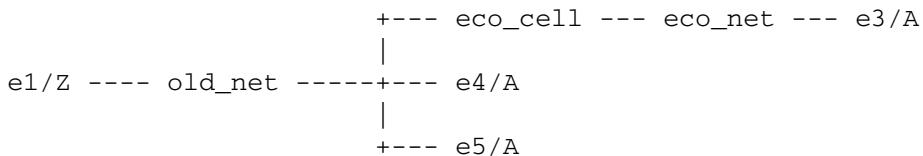

- The library cell must have an inverting output, when you use the **-inverter_pair** option. The command uses the first inverting output, inserting two cells, and preserving the logic of the path.
- The *number* argument of the **-no_of_cells** option must be a positive, non-zero number.

Inserting and Connecting the New Buffer

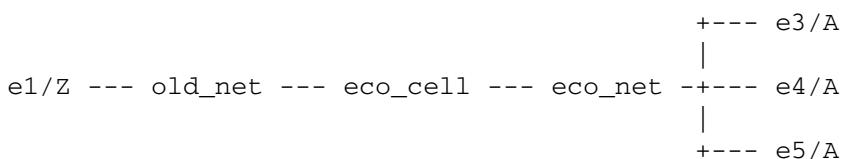

The **insert_buffer** command connects the new buffer or inverter pair according to the rules as explained with the following diagrams.

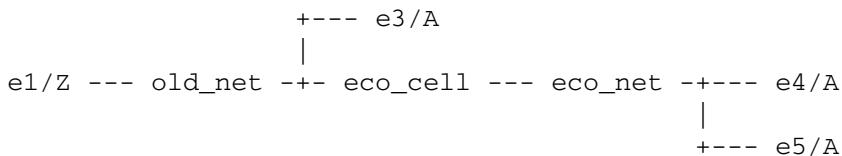

- If the specified pin is a load, the load is disconnected from its old net, and connected to the new net, as shown below.

- If the specified pin is a driver, all loads on that net are disconnected from the old net and connected to the new net, as shown below.

- If a list of load pins on the same net are specified, they are grouped, and the new net will drive them, as shown below.

- Buffering cannot be done if the net is multi-driven.

Buffering Inside Boundary Pins

When you specify insertion of a buffer at a pin on the boundary of a hierarchical block, the **insert_buffer** command inserts the buffer either inside or outside the hierarchical block, depending on the current hierarchical scope. To insert the buffer inside it, set the scope to that block by using the **current_instance** command, then execute the **insert_buffer** command. The buffer is inserted within the block to which **current_instance** is set.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example specifies a *lib_cell* that is not a buffer. The command fails and an error message is generated.

```

prompt> insert_buffer e1/Z class/AN2P
Information: Buffering net old_net. (HFS-701)
Error: library cell 'AN2P' is not a buffer or an inverter. (NLE-010)

```

The following example specifies a buffer for the *lib_cell*.

```

prompt> insert_buffer e1/Z class/B1I
Information: Buffering net old_net. (HFS-701)
Creating net 'eco_net' in design 'top'.
Creating cell 'eco_cell' in design 'top'.
Disconnecting net 'old_net' from pin 'e3/A'.
Disconnecting net 'old_net' from pin 'e4/A'.
Disconnecting net 'old_net' from pin 'e5/A'.
Connecting net 'eco_net' to pin 'e3/A'.
Connecting net 'eco_net' to pin 'e4/A'.
Connecting net 'eco_net' to pin 'e5/A'.

```

```

Connecting net 'eco_net' to pin 'eco_cell/Z'.
Connecting net 'old_net' to pin 'eco_cell/I'.
Warning: Setting default orientation 'North' on the object 'eco_cell'. (PSYN-294)
{eco_cell}

```

The following example specifies an inverter form the *lib_cell*. The command succeeds and creates the new cells eco_cell, eco_cell_1, eco_cell_2 and the new nets eco_net, eco_net_1, eco_net_2.

```

prompt> insert_buffer e3/A class/IV
Information: Buffering net old_net. (HFS-701)
Creating net 'eco_net' in design 'top'.
Creating net 'eco_net_1' in design 'top'.
Creating cell 'eco_cell' in design 'top'.
Creating cell 'eco_cell_1' in design 'top'.
Disconnecting net 'old_net' from pin 'e3/A'.
Connecting net 'eco_net' to pin 'e3/A'.
Connecting net 'eco_net' to pin 'eco_cell/Z'.
Connecting net 'eco_net_1' to pin 'eco_cell/A'.
Connecting net 'eco_net_1' to pin 'eco_cell_1/Z'.
Connecting net 'old_net' to pin 'eco_cell_1/A'.
Warning: Setting default orientation 'North' on the object 'eco_cell'. (PSYN-294)
Warning: Setting default orientation 'North' on the object 'eco_cell_1'. (PSYN-294)

insert_diode

Inserts diodes into the design to fix antenna violations.

SYNTAX

```
status insert_diode
[-nets collection_of_nets]
[-antenna_check_engine internal | hercules]
[-internal_check_option all | top_layer_only]
[-no_auto_cell_selection]
[-diode_cells collection_of_diode_cells]
[-prefix prefix_name]
[-use_hierarchical_diode_instance_name]
[-same_row]
[[-dont_freeze_existing_placement]
 | [-routing skip | when_all_violations_are_gone | always]]
[-]
signal_route_options ignore_lower_layers | include_lower_layers | include_all_lower
_layers | advanced]
[-max_ratio max_ratio_number]
```

Data Types

<i>collection_of_nets</i>	collection
<i>collection_of_diode_cells</i>	collection
<i>prefix_name</i>	string
<i>max_ratio_number</i>	integer

ARGUMENTS

```
-nets collection_of_nets
      Specifies a collection of nets.

-antenna_check_engine internal | hercules
      Specifies either the internal antenna checker and/or Hercules. The default
      is internal.

-internal_check_option all | top_layer_only
      Specifies to report either all antenna rule violations or to report only the
      top-layer antenna violations. The default is all.

-no_auto_cell_selection
      Specifies not to perform searches of the design library and its reference
      libraries for all diode cells. If you use this option, you must also use the
      -diode_cells option to specify one or more diode cells. The default is for
      the tool to search design library and reference libraries for all diode cells.

-diode_cells collection_of_diode_cells
      Specifies one or more diode cells. If you specify more than one diode port
      and if more than one diode port can be used to fix the antenna violation, the
      tool inserts the smallest diode port to fix the problem.
```

-prefix prefix_name
 Specifies a common prefix for all of the diode cell instances to insert. Use a unique prefix such as `ant_fix_0428_` so that the diode instances can be easily identified later.

-use_hierarchical_diode_instance_name
 Specifies whether or not to use the hierarchical diode instance name.

-same_row
 Specifies whether or not to places diodes in the same row as violation port. The tool will try to place the diode in the same row as the cell where the violation occurs whenever possible. This may not be possible due to existing placed cells. By default, the tool decides best location to place the diode. This option will automatically turn on **-dont_freeze_existing_placement** option. The **-same_row -routing** options are mutually exclusive.

-dont_freeze_existing_placement
 Specifies not to freeze the placement of existing cell instances. The **-dont_freeze_existing_placement -routing** options are mutually exclusive. By default, the tool freezes the placement of all existing cell instances before inserting any diode cell instances.
 You can also choose to let the command complete the routing by using the **-routing** option. The "complete routing" option is always set to **No** in this case, because it would not benefit you to run the engineering change order (ECO) detail router if the existing placement is already altered. You might need to re-run the global router and track assignment.

-routing skip | when_all_violations_are_gone | always
 Specifies the extent of the routing process. Using **skip** stops routing after placing the diode cell instances. Using **when_all_violations_are_gone** invokes the detail router only when diodes are added to all of the reported violations. Using **always** invokes the detail router in ECO mode to route diode ports after placing diode cell instances.
 If the command failed to add diodes to all of the violations (for example, if no diode is large enough to fix it) and you have invoked the ECO detail router, runtime might now be impacted because the router continues to attempt to fix the remaining antenna violations under tight ECO constraints. You can obtain a better result by using the normal (non-ECO) **search & repair**. Using **always** allows you to decide what to do when diodes cannot be added for all violations.
 The **-dont_freeze_existing_placement -routing** options are mutually exclusive. The default is **when_all_violations_are_gone**.

-signal_route_options ignore_lower_layers | include_lower_layers | include_all_lower_layers | advanced
 Specifies the HPO Signal route options for checking a charge-collecting antenna. By default, the tool does not check or fix charge-collecting antennas. Using **ignore_lower_layers** calculates the maximum ratio for checking antennas using the top mask layer only as the wiring area. If this is specified, the tool calculates the maximum ratio for checking antennas by using the area from the input port to the closest top layer as the wiring area.
 Using **include_all_lower_layers** calculates the maximum ratio for checking antennas by using the area from the input port to the farthest top layer as the wiring area.

Using **advanced**, causes the router to use the antenna rule defined by the **define_antenna_layer_rule** and **define_antenna_rule** IC Compiler commands, instead of the ratio specified by using the **-max_ratio** option or the ratio set by using the **set_parameter** command.

-max_ratio max_ratio_number

Specifies the maximum allowable ratio of wiring area and gate area for checking a charge-collecting antenna.

DESCRIPTION

This command inserts diodes into the design to fix antenna violations. First, the tool runs the internal antenna checker or uses Hercules output to identify antenna violations. Next, a diode cell (or multiple diodes when the antenna ratio requires the protection of more than one diode) is placed for each violation. You can freeze all of the existing cells' placement and routing so the diode cells are placed only in existing empty spaces to minimize the impact on existing placement and routing. You can also let the **insert_diode** command complete the routing of the diode cells when cell placement is already frozen. Whenever possible, the tool ties diode cells to the existing wires without ripping and rerouting the entire net.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of the **insert_diode** command.

```
prompt> insert_diode -signal_route_options \
include_lower_layers -max 1000
```

The following is an example of the **insert_diode** command.

```
prompt> insert_diode -antenna_check_engine hercules \
-signal_route_options include_all_lower_layers -max_ratio 200
```

The following is an example of the **insert_diode** command.

```
prompt> insert_diode -no_auto_cell_selection \
-signal_route_options ignore_lower_layers -max_ratio 100 \
-diode_cells pv0a
```

The following is an example of the **insert_diode** command.

```
prompt> insert_diode \
-signal_route_options include_all_lower_layers \
-max 150 -routing skip -prefix diode
```

insert_isolation_cell

Inserts isolation cells on the specified nets, pins or ports. Isolation cell is a general term that applies to isolation (ISO) cells and enabled level-shifter (ELS) cells.

SYNTAX

```
status insert_isolation_cell
[-force]
[-verbose]
-enable enable_signal
-object_list objects
-reference lib_cell_name
```

Data Types

objects collection

ARGUMENTS

-force
Forces insertion of isolation cells on nets with the dont_touch or always_on attributes. By default, the tool does not insert isolation cells on such nets.

-verbose
Provides detailed report on the isolation cells inserted in the design.

-enable *enable_signal*
Specifies the signal in the design to be connected to the enable pin of the inserted isolation cells. You can specify this signal as either a net, a pin, or a port. This is a required argument.

-object_list *objects*
Specifies a list of pins, ports, or nets on which to insert the isolation cells. If you specify object names, the tool resolves conflicts in the order of ports, pins and nets. This is a required argument.

-reference *lib_cell_name*
Specifies the name of the library cell of the isolation cell. This can be either an isolation (ISO) cell or an enabled level-shifter (ESL) cell. This is a required argument.

DESCRIPTION

The **insert_isolation_cell** command inserts isolation cells on the netlist objects specified in the **-object_list** option and connects the enable pin of each inserted cell to the enable signal specified in the **-enable** option. The tool determines the set of possible reference cells for the ISO or ELS cells by searching the link libraries for cells matching the name specified in the **-reference** option.

The tool selects the reference cell for each netlist object by using the following

strategy:

- * If the driver and all loads of the associated net operate at the same voltage, the tool selects an ISO cell that matches the operating condition of the subdesign in which the net resides. If such an ISO cell is not found, but an appropriate ELS cell is found, the tool selects the ELS cell.
- * If the driver and loads of the associated net operate at different voltages (a multivoltage net), the tool selects the first ELS cell that implements voltage-level shifting. ISO cells are not used for multivoltage nets.

The tool determines where to put each ISO or ELS cell based on the type of the netlist object:

- * If you specify a subdesign port, the tool inserts the ISO or ELS cell on the net connection inside the subdesign, next to the specified port. When you specify a driver port, the ISO or ELS cell connects to all paths driven by the port. When you specify a load port, the ISO or ELS cell connects only to the path ending at the load port.

To specify subdesign ports, use the **get_ports** command.

- * If you specify a subdesign pin, the tool inserts the ISO or ELS cell on the net connection outside the subdesign, next to the specified pin. When you specify a driver pin, the ISO or ELS cell connects to all paths driven by the pin. When you specify a load pin, the ISO or ELS cell connects only to the path ending at the load pin.

To specify subdesign pins, use the **get_pins** command.

- * If you specify a net, the tool inserts the ISO or ELS cell in net's parent subdesign.

To specify a net, use the **get_nets** command.

By default, the tool uses the <power_domain_name>_ISO_<count> naming rule to generate names for isolation cells. Each isolation cell inside its own domain gets a unique count. You can add a prefix string to the automatically generated name by specifying a value for the **isolation_cell_naming_prefix** variable.

In the following situations, the command does not insert an ISO or ESL cell on the associated net and flags the net as a violating net:

- * The tool cannot find an appropriate library cell for the net.
- * The net has multiple drivers.
- * The net is connected to a bidirectional pin.
- * The net has a dont_touch or always_on attribute.

You can use the **-force** option to force the insertion of isolation cells on such nets. However, you should not use this option when the operating conditions of the isolation cell and the subdesign do not match.

NOTE: This command is supported only on uniquified designs and designs with power domains.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example inserts a GTECH isolation cell on the IN net inside the I1 hierarchical instance. The enable pin of the isolation cell is wired to the ENABLE port of the design.

```
prompt> insert_isolation_cell -reference GTECH_ISO1_EN0 \
          -object [get_nets {I1/IN}] \
          -enable [get_ports ENABLE]
```

The following example inserts a GTECH isolation cell on the net connected to port A of instance I1. Because a port is specified, the isolation cell is inserted inside the I1 block.

```
prompt> insert_isolation_cell -reference GTECH_ISO1_EN0 \
          -object [get_ports {I1/A}] \
          -enable [get_ports ENABLE]
```

The following example inserts a GTECH isolation cell on the net connected to pin A of instance I1. Because a pin is specified, the isolation cell is inserted outside the I1 block.

```
prompt> insert_isolation_cell -reference GTECH_ISO1_EN0 \
          -object [get_pins {I1/A}] \
          -enable [get_ports ENABLE]
```

The following example inserts an enabled level shifter on the RET net. The enable pin of enabled level shifter is wired to the en net inside the PWRCTRL hierarchical instance.

```
prompt> insert_isolation_cell -reference LVLHLEHX2 \
          -object [get_nets RET] \
          -enable [get_nets PWRCTRL/en]
```

SEE ALSO

```
remove_isolation_cell(2)
get_pins(2)
get_ports(2)
get_nets(2)
```

insert_level_shifters

Inserts appropriate level shifters in the current design.

SYNTAX

```
status insert_level_shifters
[-preserve]
[-all_clock_nets]
[-clock_net clock_name]
[-verbose]
```

Data Types

clock_name string

ARGUMENTS

-preserve

Preserves the existing level shifters in the netlist. The command sets the **dont_touch** attribute on the appropriate load or driver net(s). The command does not remove a level-shifter cell even if it has voltage violations. The command does insert level shifters with this option but will try to find the correct operating conditions for the existing level shifters.

-all_clock_nets

Allows the addition of level-shifter cells for all of the clock nets in the design. By default, the command does not perform level shifter insertion for clock nets. This option and **-clock_net** are mutually exclusive.

-clock_net *clock_name*

Specifies the name of the clock net on which the level shifters are to be inserted. By default, the command does not perform level shifter insertion for clock nets. This option and **-all_clock_nets** are mutually exclusive.

-verbose

Displays all level shifters that the command finds in the target libraries. This option also displays all possible operating points at which each level shifter could be used by the command.

DESCRIPTION

This command inserts level shifters in the current design. The level shifters are inserted between the threshold and all of the nets that need the voltage adjustments according to the user-defined strategy. You can set the strategy and threshold using the **set_level_shifter_strategy** and **set_level_shifter_threshold** commands.

This command may fail to insert level shifters under the following conditions:

- There are no appropriate level shifters in the target library for particular input and output voltages.

- The appropriate level shifter exists in the target library but it is set with the **dont_use** attribute.
- The net is set with the **dont_touch** attribute.
- The net is driven by multiple drivers at different voltages.
- The net is a clock net and you have not used the **-all_clock_nets** or **-clock_net** options.

This command implicitly removes all existing buffer-type level-shifter cells from the design, unless they are set as dont_touch or invoked with the **-preserve** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example inserts level shifters in a design:

```
prompt> insert_level_shifters
```

The following example shows the result of using the **-verbose** option:

```
prompt> insert_level_shifters -verbose
```

```

```

Data Types

<i>llx</i>	float
<i>lly</i>	float
<i>urx</i>	float
<i>ury</i>	float
<i>instance_name</i>	string
<i>route_space</i>	float
<i>from_metal_number</i>	integer
<i>to_metal_number</i>	integer
<i>layer</i>	string
<i>width</i>	float
<i>space_between_fills</i>	float
<i>min_length</i>	float
<i>max_length</i>	float
<i>keep_from_metal_space</i>	float
<i>keep_from_pg_nets_space</i>	float
<i>x_distance</i>	float
<i>y_distance</i>	float
<i>poly_to_cell_distance</i>	string

ARGUMENTS

-out self | cellview_name
Specifies where to generate output. Use **self** to generate output in the current cellview. Use *cellview_name* to generate output in the specified cell view. The default value is *cell_name*.

-purge
Clears up all metal fill in the current cell view. You can purge fill-track objects only on selected metal layers. You can control the fill-track objects to be purged by changing the numbers in the **-from_metal** and **-to_metal** options. By default, without specifying metal in either the **-from_metal** or **-to_metal** options, the command purges all fill-track objects in the current cell view.

-bounding_box {{llx lly} {urx ury}}
Indicates a list of float values as the coordinates of the rectangle where metal fills are to be inserted. By default, the working area is the entire chip.

-dont_overwrite
Specifies not to modify existing metal fill. You can use this option to incrementally insert metal fill.

-timing_driven
Performs all necessary timing checks and calculations to create fills without violating timing. This can result in wider spacing for metal fills around timing-critical wires. This option might conflict with the local minimum metal density specification, making it difficult to meet both density and timing requirements in some critical areas.

-insert_as_instance instance_name
Specifies the cell instance to be created for the fill view in the current design. If you use this option, you should also specify the **-out** option with the *cellview_name* argument.

-tie_to_net none | ground | net_name
Specifies whether or not the fill metal is tied to the net; and, if so, specifies the type of tie. Use **none** if you want the fill metal to remain floating and not be tied to a net. Use **ground** to tie the fill metal to ground. Use *net_name* to tie the fill metal to a specific net. If there is more than one ground net, the name of the net must be specified by using a *net_name* value. The specified net must be of power or ground type. The default value is **none**.

-create_floating_vias
Creates floating vias to meet the via density rule.

-floating_via_ftr_spacing
Uses the **-space_to_route** value of each layer for floating vias to keep away from existing metal. Otherwise the minSpacing of each layer is used.

-routing_space route_space
Specifies the space between normal routing wires and the fill metal. This value is multiplied by the minSpacing of the metal layer. The default is **1.0**.

-from_metal *from_metal_number*
 Specifies the starting metal layer from which empty tracks are filled and the uppermost layer specified by the **-to_metal** option. By default, *from_metal_number* is **1**.

-to_metal *to_metal_number*
 Fills empty tracks beginning with the specified *from_metal_number* layer and ending at the *to_metal_number* layer. By default, *to_metal_number* is **15**.

-width {*layer width*}
 Specifies the width for fill tracks. You can specify a list of layers and widths. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. By default, the command uses the *defaultWidth* from the physical library.

-space {*layer space_between_fills*}
 Specifies the space for fill tracks. You can specify a list of layers and spaces. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. Spacing refers to the lengthwise spacing between fills of the same layer only. By default, the command uses the *minSpacing* from the physical library.

-min_length {*layer min_length*}
 Specifies the minimum length for fill tracks. You can specify a list of layers and minimum lengths. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. By default, the command uses the *minWidth* from the physical library.

-max_length {*layer max_length*}
 Specifies the maximum length for fill tracks. You can specify a list of layers and maximum lengths. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. By default, the command has no limit on the maximum length.

-space_to_route {*layer keep_from_metal_space*}
 Specifies the space to keep away from existing metal. You can specify a list of layers and spaces. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. By default, the command uses the *minSpacing* of each layer.

-space_to_pg {*layer keep_from_pg_nets_space*}
 Specifies the space to keep away from power/ground nets. You can specify a list of layers and spaces. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. By default, the command uses the **-space_to_route** value of each layer.

-stagger {*layer*}
 Specifies the list of layers for which a stagger pattern of metal fill is to be generated. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. You can generate a stagger pattern by turning on this option or by specifying the *x-offset* and *y-offset*.

-x_offset {*layer x_distance*}
 Specifies the *x-offset* for each metal layer to be used for metal fill. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. The default is **0**.

-y_offset {*layer y_distance*}
 Specifies the *y-offset* for each metal layer to be used for metal fill. Each layer must be a string, such as *poly*, *m1*, *m2*, and so on. The default is **0**.

```
-dont_snap_fill_to_track
    Skips snapping the fill to wiretracks. Use this option only if you are also
    using either the -stagger option or the -x-offset and y-offset options.

-fill_poly
    Fills the poly layer. By default, the command does not fill the poly layer.

-distance_to_boundary poly_to_cell_distance
    Specifies the spacing of the poly to the cell boundary. This distance is the
    specified distance plus poly-to-poly minimum spacing. The default value is
    0.0.
```

DESCRIPTION

This command fills all of the empty tracks with the metal wires to meet the metal density rules required by most processes. This procedure is performed after routing and before layout versus schematic, design rule checking, or layout parasitic extraction (LPE).

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example fills all of empty tracks with metal wires.

```
prompt> insert_metal_filler
```

The following example fills empty tracks without overwriting the existing cellview.

```
prompt> insert_metal_filler -dont_overwrite
```

The following example fills the poly layer by maintaining spacing with the cell boundary as specified.

```
prompt> insert_metal_filler -fill_poly\
-distance_to_boundary 2
```

The following example fills empty tracks and creates a cell instance for the fill view in the current design.

```
prompt> insert_metal_filler\
-insert_as_instance Instance
```

The following example fills the tracks from metal layer 1 to 4 within the area specified by the bounding box.

```
prompt> insert_metal_filler\n-bounding_box {{10 20} {100 300}}\n-from_metal 1 -to_metal 4
```

The following example fills tracks and ties them to ground, keeping space between the routing wires and fill metals as indicated by using the **-routing_space** option.

```
prompt> insert_metal_filler -tie_to_net ground\n-routing_space 3
```

The following example fills the tracks from metal layer 1 to 2 and ties them to VDD.

```
prompt> insert_metal_filler -tie_to_net VDD\n-from_metal 1 -to_metal 2
```

The following example fills tracks with width *0.1* for metal 1 and spacing *0.1* for poly and length ranging from *2* to *10* for metal 1 2, and 3. It applies default values for any others that you do not specify.

```
prompt> insert_metal_filler -width {m1 0.1}\n-space {poly 0.1}\n-min_length {m1 2 m2 2 m3 2}\n-max_length {m1 10 m2 10 m3 10}
```

SEE ALSO

```
insert_diode(2)\ninsert_ng_filler(2)\ninsert_pad_filler(2)\ninsert_stdcell_filler(2)\ninsert_well_filler(2)\nset_parameter(2)
```

insert_ng_filler

Generates notch and gap filling information for filling notches and gaps that are smaller than the minimum distance required between objects of the same net on the same layer.

SYNTAX

```
int insert_ng_filler
[-include_existing_notch_gap_fill_cell]
[-skip_filling_child_cell]
[-dont_apply_fat_wire_rule]
[-dont_fill_corner_to_corner]
[-out outname]
[-notch_layer_data_type notch_datatype]
[-gap_layer_data_type gap_datatype]
[-layers layer_list]
```

Data Types

<i>outname</i>	string
<i>notch_datatype</i>	integer
<i>gap_datatype</i>	integer
<i>layer_list</i>	list

ARGUMENTS

- include_existing_notch_gap_fill_cell
 - Specifies to use notch and gap cells that exist in the netlist. The notch and gap cells have a .FILL extension.
- skip_filling_child_cell
 - Specifies not to read the child cell's port data and apply filling on the child ports. By default, filling is applied on the child ports.
- dont_apply_fat_wire_rule
 - Specifies not to apply the fat wire rule when filling the notches and gaps. By fault, the fat wire rule is applied. See the man page for **set_fact_contact_options** for further information.
- dont_fill_corner_to_corner
 - Specifies not to fill the corner-to-corner notch errors. By default, the tool fills these notch errors.
- out *outname*
 - Specifies the error cell name from which to save any notch and gap errors. By default, notch and gap errors are not saved.
- notch_layer_data_type *notch_datatype*
 - Specifies the notch layer data type. Valid values are 0 through 255. If not specified, the default is 0.
 - See the DESCRIPTION section for more information.

```

-gap_layer_data_type gap_datatype
    Specifies the gap layer data type. Valid values are 0 through 255. If not
    specified, the default is 0.
    See the DESCRIPTION section for more information.

-layers layer_list
    Specifies the layers to fill for notch and gap. By default, the value is {M1
    M2 M3 ... M12}. The tool fills M1 to the maximum metal available in the
    design. The maximum metal layer supported is M12.

```

DESCRIPTION

The **insert_ng_filler** command generates notch and gap filling information for filling notches and gaps that are smaller than the minimum distance required between objects of the same net on the same layer. The information is stored in the FILL view cell. For example, the notch and gap cells for a top design cell named *rgb* is *rgb.FILL*. This information is used when you translate the data to GDSII stream.

The **-notch_layer_data_type** and **-gap_layer_data_type** options values from 0 through 6 are predefined as follows:

Data Type	Value
<hr/>	
No data	0
Bit array	1
Two byte signed integer	2
Four byte signed integer	3
Four byte real	4 (not used)
Eight byte real	5
ASCII string	6

Values from 7 through 255 are user-defined.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```

prompt> insert_ng_filler -include_existing_notch_gap_fill_cell \
    -skip -dont_apply_fat_wire_rule \
    -dont_fill_corner_to_corner \
    -notch_layer_data_type 2 -gap_layer_data_type 5 \
    -layer {m1 m3 m5}

prompt> insert_ng_filler -include_exisitng_notch_gap_fill_cell \
    -dont_apply_fat_wire_fule -out test.err

```

```
prompt> insert_ng_filler -skip_filling_child_cell \
      -dont_fill_corner_to_corner -layer {M1 M2 M4 M6}

prompt> insert_ng_filler -notch_layer_data_type 3 \
      -gap_layer_data_type 1
```

insert_pad_filler

Fills gaps in the pad ring with instances of pad filler cells.

SYNTAX

```
int insert_pad_filler
-cell lib_cells
[-overlap_cell overlap_lib_cells]
[-voltage_area voltage_area_list]
[-bounding_box rectangle]
[-prefix prefix]
[-no_left]
[-no_right]
[-no_bottom]
[-no_top]
```

Data Types

<i>lib_cells</i>	string
<i>overlap_lib_cells</i>	string
<i>voltage_area_list</i>	list
<i>prefix</i>	string

ARGUMENTS

```
-cell lib_cells
    Specifies the names of the pad filler cells to be used. The tool adds the
    cells in the priority that they are specified.

-overlap_cell overlap_lib_cells
    Specifies the names of pad filler cells that can overlap other pad filler
    cells. The names specified here also need to be specified in the -cell list.

-voltage_area voltage_area_list
    Specifies the voltage areas where the pad fillers are to be inserted. Default
    is all voltage areas.

-bounding_box rectangle
    Specifies the rectangle region where pad cells are to be inserted. By default,
    the working area is the entire chip.

-prefix prefix
    Inserts an extra string of user choice into the name of pad filler cell
    instances created by this command. The prefix can later be used to identify
    the pad filler cells added.

-no_left
    Does not insert pad filler cells on the left boundary.

-no_right
    Does not insert pad filler cells on the right boundary.
```

```
-no_bottom
    Does not insert pad filler cells on the bottom boundary.

-no_top
    Does not insert pad filler cells on the top boundary.
```

DESCRIPTION

The **insert_pad_filler** command fills gaps in the pad ring with instances of pad filler cells in the library. It is recommended that you complete the routing process before you add pad filler cells.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example inserts pad filler cells PFILL_2X and PFILL_1X in the given priority order:

```
prompt> insert_pad_filler -cell "PFILL_2X PFILL_1X"
```

The following example inserts pad filler cells PFILL_2X and PFILL_1X on the pad ring and inside voltage area V1 only. The PFILL_1X cell is allowed to overlap other pad filler cells to fill gaps that are too small for any pad filler cell.

```
prompt> insert_pad_filler -cell "PFILL_2X PFILL_1X" \
-overlap_cell "PFILL_1X" -voltage_area {V1}
```

The following example inserts pad filler cells PFILL_2X and PFILL_1X on the pad ring, skipping the top and right boundary:

```
prompt> insert_pad_filler -cell "PFILL_2X PFILL_1X" -no_top -no_right
```

SEE ALSO

```
insert_diode(2)
insert_metal_filler(2)
insert_ng_filler(2)
insert_stdcell_filler(2)
insert_well_filler(2)
set_parameter(2)
```

insert_port_protection_diodes

Inserts diodes around the specified ports to protect them. One diode is added to each specified port.

SYNTAX

```
status insert_port_protection_diodes
[-prefix name]
[-ignore_dont_touch ]
{-diode_cell lib_cell}
-port list
```

Data Types

<i>name</i>	string
<i>lib_cell</i>	collection of one lib cell

ARGUMENTS

- prefix *name*
Specifies the prefix used to identify the newly added diode cells. If you do not specify this option, no prefix is used and the tool will assign a cell name. This option is optional.
- ignore_dont_touch *ignore dont_touch net*
Specifies that even if a net is a "dont_touch" net, a port protection diode may also be added into that net. By default, when this command is inserting port_protection_diodes, if a net is "dont_touch" net, no diode will be added into that net. This option is optional.
- diode_cell *lib_cell*
Specifies the name of the library reference cell used for the new diodes. You can specify only a single library cell. This option is required.
- port *list*
Specifies the ports to which to connect protection diodes. This option is required.

DESCRIPTION

The **insert_port_protection_diodes** command performs the following tasks: 1. Creates the new diodes and adds them into the netlist. 2. Connects the new diodes to the specified ports. 3. Legalizes the diodes. 4. Marks the diodes as FIXED.

This command is supposed to be used in "pre-route" stages for the purpose of "antenna prevention". A typical usage model for this command may be like:
`insert_port_protection_diodes place_opt clock_opt route_opt`

Please note: if this command succeeds, all of the "inserted new diodes" will be located at legal locations and marked as FIXED. However, this does not necessarily mean that other movable standard cells will be legal. There may be a chance that

some movable standard cells are overlapping with the "inserted new diodes". As for how to remove the overlapping between the "inserted new diodes" and existing movable standard cells, it will be up to the user's option. After the port protection diodes have been added, users can run command place_opt/clock_opt/route_opt or just a legalize_placement command to make the entire design legal.

Multicorner-Multimode Support

This command uses information from all active scenarios.

EXAMPLES

The following example runs the **insert_port_protection_diodes** command.

```
prompt> insert_port_protection_diodes -prefix MY_DIODE \
-diode_cell [get_lib_cell XXX] [all_inputs *]
```

SEE ALSO

`report_port_protection_diodes(2)`
`legalize_placement(2)`

insert_redundant_vias

Replaces the specified single-cut vias with a multiple-cut via array. It can also replace a single via with another single via that has a different contact code.

SYNTAX

```
status insert_redundant_vias
-from_via list_of_from_vias
-to_via list_of_to_vias
[-to_via_x_size list_of_x-sizes]
[-to_via_y_size list_of_y-sizes]
[-via_array_no_swap]
[-optimize_level level_of_optimization]
[-num_cpus number_of_cpus]
[-auto_mode preview | insert]
```

Data Types

<i>list_of_from_vias</i>	list
<i>list_of_to_vias</i>	list
<i>level_of_optimization</i>	integer
<i>number_of_cpus</i>	integer

ARGUMENTS

-from_via *list_of_from_vias*

Specifies a list of via names to be replaced. The via names are defined in the technology file.

-to_via *list_of_to_vias*

Specifies a list of names corresponding to the new vias to be created. The via names are defined in the technology file. The *list_of_to_vias* list is usually the same as the corresponding *list_of_from_vias* list specified in the **-from_via** option. If the list is different, the layer definition of the two vias must be the same.

-to_via_x_size *list_of_x-sizes*

Specifies a list of the x-sizes for the newly created vias. For any given via, either the x-size or y-size must have a value equal to 1. The default value is **1**.

-to_via_y_size *list_of_y-sizes*

Specifies a list of the y-sizes for the newly created vias. For any given via, either the x-size or y-size must have a value equal to 1. The default value is **1**.

-via_array_no_swap

Specifies not to swap the row and column of via arrays. In other words the $1 \times N$ and $N \times 1$ via arrays are not considered equivalent. By default, the command allows you to swap the row and column of via arrays.

```

-optimize_level level_of_optimization
    Determines how aggressively to try different positions for a line via array
    insertion. A value of 0 tries relatively fewer positions; and a value of 1
    tries more. The default is 0.

-num_cpus number_of_cpus
    Specifies the number of CPUs in distributed processing. The default is 1.

-auto_mode preview | insert
    Specifies the mode in which to automatically generate via lists.
    If you specify preview, all vias defined in the technology file are listed,
    but no redundant vias are inserted.
    If you specify insert, redundant vias that are defined as default vias in the
    technology file are inserted.
    This option is mutually exclusive with the -from_via, -to_via, -
to_via_x_size, and -to_via_y_size options.

```

DESCRIPTION

This command can replace all of the specified single-cut vias in the design with a multiple-cut via array or even a different via with the same layers. From netlist connectivity point of view, using a single-cut via is no different from using a multiple-cut via array, so additional via cuts in a multiple-cut via array are regarded as redundant vias from this point of view. However, redundant vias can increase yield during manufacturing and are an important design-for-manufacturing (DFM) feature.

The single-cut via is replaced only when the new via or via array does not introduce any design rule violations.

The **insert_redundant_vias** command provides two insertion methods: manual or automatic.

The manual method (using the **-from_via**, **-to_via**, **-to_via_x_size**, and **-to_via_y_size** options) provides the flexibility to customize the redundant via insertion. During manufacturing, different vias have different yield loss impact and redundant via insertions of different vias have a different impact of the yield of the metal layers. To maximize the yield, you can customize which kinds of redundant vias are inserted (by using the **-from_via** and **-to_via** options) and how to insert these redundant vias (by using the **-to_via_x_size** and **-to_via_y_size** options).

The automatic method (using the **-auto_mode** option) provides an easy-to-use method. You can list all of the vias on all the layers (without referencing the technology file) by using **-auto_mode preview**. You can then cut and paste part or all of the listed vias into the **-to_via** and **-from_via** options to insert redundant vias. You can also use **-auto_mode insert** to insert the default vias (as defined in the technology file) for all layers.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example replaces all VIA23 single-cut vias with 1x3 VIA23 arrays and all VIA34 single-cut vias with 5x1 VIA34 arrays.

```
prompt> insert_redundant_vias -from_via {VIA23 VIA34} \
-to_via {VIA23 VIA34} -to_via_x_size {1 5} \
-to_via_y_size {3 1}
```

The following example replaces all VIA23 single-cut vias with 1x3 VIA23 arrays.

```
prompt> insert_redundant_vias -from_via VIA23 -to_via VIA23 \
-to_via_x_size 1 -to_via_y_size 3
```

The following example replaces one list of vias with another list of vias of different x-sizes and y-sizes.

```
prompt> insert_redundant_vias \
-from_via {V1 V1 V2 V2 V3 V3 V4 V4 V6} \
-to_via {V1 V1 V2 V2 V3 V3 V4 V4 V6S} \
-to_via_x_size {1 2 1 2 1 2 1 2 1} <HardSpace<plain
-to_via_y_size {2 1 2 1 2 1 2 1 1}
```

SEE ALSO

```
insert_diode(2)

insert_ng_filler(2)
insert_pad_filler(2)
insert_stdcell_filler(2)
insert_well_filler(2)
set_parameter(2)
```

insert_spare_cells

Inserts spare cells in the legalized design.

SYNTAX

```
status insert_spare_cells
[-lib_cell lib_cell_name]
-cell_name prefix_name
[-num_instances number]
[-hier_cell hierarchy_name]
[-num_cells {lib_cell_name number}]
[-tie]
[-skip_legal]
```

Data Types

<i>lib_cell_name</i>	string
<i>prefix_name</i>	string
<i>number</i>	int
<i>hierarchy_name</i>	string

ARGUMENTS

-lib_cell *lib_cell_name*
Specifies the names of library cells for which the spares cells are to be created. If you specify more than one library cell, the instances of these cells are placed as close as possible.

-cell_name *prefix_name*
Specifies the prefix name of the spare cells to be used by the tool. An integer prefix is automatically appended to the prefix name for each instance. If a cell with a generated name already exists, the tool automatically assigns a unique name for the cell name.

-num_instances *number*
Specifies the number of instances of the library cell that are inserted as spare cells.

-hier_cell *hierarchy_name*
Specifies the level of hierarchy at which the spares cells are inserted.

-num_cells {*lib_cell_name number*}
Specifies the number of instances for each different *lib_cell_name*. This option is mutually exclusive with options **-lib_cell** and **-num_instance**.

-tie
Ties the input pins of the inserted spare cells to logic zero.

-skip_legal
Skips legalization checking. However, the command still inserts spare cells in legalized locations.

DESCRIPTION

This command inserts a specified number of instances of the library cell as spare cells in an already legalized design. This command adds the spare cells to the logical netlist and tries to place them as evenly as possible on the already placed logic, but avoids all placement blockages. The location of the existing logic is not changed and new cells are placed according to available legal locations.

If the input netlist already has spare cells that are placed during **physopt**, this command ignores the existing spare cells and does not change their locations.

Specifying more than one library cell allows you to place the instances of these spare cells as close as possible. Thus, you can connect them manually during the ECO phase.

When you want to insert spare cells in a given hierarchy by using the *-hier_cell* option, the spare cells are placed in the maximum rectangular area consisting of all the placed cells of the specified hierarchy.

If you use the *-tie* option, all the input pins of the spare cells inserted in this instance of the command are tied to logic zero. If you do not specify this option, the inputs will not get tied to logic zero.

When the design is not legalized for some reasons, spare cells can be spared using the *-skip_legal* option. All the newly inserted spare cells would be given legal locations.

To insert spare cells with different number of instances from different library cells, use the *-num_cells* option. This option is mutually exclusive with the *-lib_cell* and *-num_instances* options.

Apply this command after all the optimization and legalization steps and user constraints are met. If the design is not legalized, use the *-skip_legal* to continue the flow. Any further legalization would likely to move the placement of spare cells unless you explicitly set them as fixed cells.

This command modifies the logical netlist of the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example inserts 20 instances of a library cell named *and2* with the prefix *spares* and with the input pins tied to logic zero.

```
prompt> insert_spare_cells -lib_cell and2 \
-cell_name spares -num_instances 20 -tie
```

The following example inserts 15 instances of library cells named *and2* and *nor2* with the prefix *spares* in the sub design instance *I_SUB*.

```
prompt> insert_spare_cells -lib_cell {and2 nor2} \  
-cell_name spares -num_instances 15 -hier_cell I_SUB
```

The following example inserts 10 instances of library cell named *and1* and 5 instances of library cell named *nor1* with the prefix name *spars* in the hierarchical cell instance *I_SUB*.

```
prompt> insert_spare_cells -num_cells {and1 10 nor1 5} \  
-cell_name spares -hier_cell I_SUB
```

SEE ALSO

`legalize_placement(2)`
`spread_spare_cells(2)`

insert_stdcell_filler

Fills empty spaces in standard cell rows with instances of master filler cells only.

SYNTAX

```
status insert_stdcell_filler
[-cell_without_metal lib_cell_without_list]
[-cell_with_metal lib_cell_with_list]
[-bounding_box rectangle]
[-dont_respect_hard_placement_blockage]
[-dont_respect_soft_placement_blockage]
[-between_std_cells_only]
[-randomize]
[-respect_overlap]
[-cell_without_metal_prefix cell_without_prefix]
[-cell_with_metal_prefix cell_with_prefix]
[-avoid_layers layers_list]
[-connect_to_power Power_net_name]
[-connect_to_ground Ground_net_name]
[-voltage_area voltage_area_list]
[-vt_filler lib_cell_list]
[-check_only]
[-restore_filler_snapshot]
[-vt_filler_prefix vt_filler_prefix]
[-respect_keepout]
```

Data Types

<i>lib_cell_without_list</i>	collection
<i>lib_cell_with_list</i>	collection
<i>rectangle</i>	rectangle
<i>cell_without_prefix</i>	string
<i>cell_with_prefix</i>	string
<i>layers_list</i>	collection
<i>voltage_area_list</i>	collection
<i>lib_cell_list</i>	collection of physical lib cells
<i>vt_filler_prefix</i>	string

ARGUMENTS

-cell_without_metal *lib_cell_without_list*

Specifies the list of filler cells that are from the physical libraries to be used. The tool adds them in the order that you specify, so specify them from the largest to smallest. The tool assumes that the specified cells contain no metal, so it does not check for design rule violations after filler insertion.

-cell_with_metal *lib_cell_with_list*

Specifies the master filler cells that are from the physical libraries to be used. The tool adds them in the order that you specify, so specify them from the largest to smallest. The specified cells contain metal and are inserted only if no design rule violations are detected after insertion. By default,

the tool uses the classical router for design rule checking. If you specify Zroute by using **set_route_mode_options**, the tool uses Zroute.

-bounding_box rectangle

Specifies the rectangular region where filler cells are to be inserted. By default, the working area is the entire chip.

-dont_respect_hard_placement_blockage

Specifies an option that will be obsolete. The tool issues a warning message that instructs you to use the **-ignore_hard_placement_blockage** option instead. The **-dont_respect_hard_placement_blockage** option inserts filler cells in hard placement blockage areas. By considering hard and soft placement blockages separately, you can insert filler cells in soft blockages, while still respect the hard placement blockages in the design. By default, the tool prevents the insertion of filler cells in hard placement blockage areas.

-dont_respect_soft_placement_blockage

Specifies an option that will be obsolete. The tool issues a warning message that instructs you to use the **-ignore_soft_placement_blockage** option instead. The **-dont_respect_soft_placement_blockage** option inserts filler cells in soft placement blockage areas. By default, the tool prevents the insertion of filler cells in soft placement blockage areas.

-between_std_cells_only

Inserts filler cells only in an area between two standard cells. A filler cell is not inserted if there are abutting macros or if it would be near the two ends of a row.

-randomize

Instructs the tool not to follow the specified list order. Use this feature when the filler cell masters are the same size.

-respect_overlap

Considers the overlap check rectangles outside the standard cell boundary to be part of the standard cell. The tool does not fill the areas under the overlap check rectangle. By default, filler cell insertion ignores the overlap check rectangle layer(192) of standard cells.

-cell_without_metal_prefix cell_without_prefix

Adds a prefix of your choice to the instance names of the filler cells without metal created by this command. You can later use the prefix to identify the filler cell instances.

-cell_with_metal_prefix cell_with_prefix

Adds a prefix of your choice to the instance names of the filler cells with metal created by this command. You can later use the prefix to identify the filler cell instances.

-avoid_layers layers_list

Prevents insertion of filler cells under the specified metal layers (from the technology file) where preroute exists. This option works the same as the **-avoid_filler_under** option except that it takes layer names from technology file. By default, the tool attempts to fill in areas under all metal layers.

-connect_to_power *Power_net_name*
 Specifies the name of the existing power net to which to connect filler cells.

-connect_to_ground *Ground_net_name*
 Specifies the name of the existing ground net to which to connect filler cells.

-voltage_area *voltage_area_list*
 Specifies a list of the voltage areas to insert filler cells.

-vt_filler *lib_cell_list*
 Specifies the threshold voltage cells to be used as threshold voltage (vt) fillers.
 If you do not specify this option, all threshold voltage cells are used. If you specify an empty list, no threshold voltage cells are added.

-check_only
 Runs the command in checking mode, rather than insertion mode. In checking mode, this command lists the empty spaces in standard cell rows with instances of master filler cells in the library without copying them.

-restore_filler_snapshot
 Restores the filler cell placement of the snapshot previously created if the standard cell placement of the filling areas has not changed. A filler cell snapshot is created when filler cells are deleted. This option allows you to preserve the previous filler cell placement whenever possible. This helps to preserve the timing and capacitance coupling characteristics of the design.

-vt_filler_prefix *vt_filler_prefix*
 Specifies a prefix for the collection of threshold voltage fillers inserted by this command.
 You can use the prefix later to identify the threshold voltage filler cell instances.
 If you do not specify this option, the command uses the default prefix "xofiller!my_vt_filler_prefix!".

-respect_keepout
 When specified, the tool respects hard and soft keepout margins on hard macros. Keepout areas are treated as if they are occupied by a blockage. This option applies only to keepout margins on hard macros.

DESCRIPTION

This command fills empty spaces in standard cell rows with instances of master filler cells in the library. Perform placement (and clock tree synthesis, if applicable) before adding filler cells.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example fills empty spaces with filler cells named *FILL_4X*, *FILL_2X*, and *FILL_1X* in the given order. If the sizes of the filler cells are such that *FILL_4X* > *FILL_2X* > *FILL_1X*, this ordering minimizes the number of filler cells added by using the larger filler cells first.

```
prompt> insert_stdcell_filler -cell_without_metal \
{FILL_4X FILL_2X FILL_1X}
```

The following example fills empty spaces with metal filler cells given by the ordered list *FILL_4XM*, *FILL_2XM*, and *FILL_1XM* at places where design rules are satisfied. If design rule errors occur, the command uses the non-metal filler cells named *FILL_4X*, *FILL_2X*, and *FILL_1X*.

```
prompt> insert_stdcell_filler -cell_without_metal \
{FILL_4X FILL_2X FILL_1X} -cell_with_metal} \
{FILL_4XM FILL_2XM FILL1XM}
```

The following example fills empty spaces with filler cells *FILL_2X* and *FILL_1X* in the bounding box (10.0,10.0) (5000.0,5000.0) and the command fills only areas between two standard cells. In addition, filler cells are not inserted under metal 3 or metal 4 preroutes.

```
prompt> insert_stdcell_filler \
-cell_without_metal {FILL_2X FILL_1X} \
-bounding_box {{10.0 10.0} {5000.0 5000.0}} \
-between_std_cells_only -avoid_filler_under {M3 M4}
```

The following example fills empty spaces with filler cells named *FILL_2X* and *FILL_1X* in a voltage area named *VA1* and avoids a layer named *my_metal_2*.

```
prompt> insert_stdcell_filler \
-cell_without_metal {FILL_2X FILL_1X} \
-voltage_area {VA1} \
-avoid_layers "my_metal_2"
```

Data Types

<i>physical_lib_cell</i>	string
<i>layer_name</i>	string
<i>distance</i>	float
<i>prefix</i>	string
<i>power_net</i>	net
<i>ground_net</i>	net
<i>metal_layers_list</i>	collection
<i>voltage_area_list</i>	collection

ARGUMENTS

-drc_spacing_check
Reports spacing violations without inserting tap cells. The **-drc_spacing_check** and **-tap_cell_insertion** options are mutually exclusive.
You can specify only one.

-tap_cell_insertion
Inserts tap cells while meeting design rules specified. The **-drc_spacing_check** and **-tap_cell_insertion** options are mutually exclusive.

insert_tap_cells_by_rules

1098

You can specify only one.

-tap_distance_based

Selects the distance based method to ensure design rule compliance. This method uses a simple spacing measurement from a standard cell to a tap cell. It ignores the actual metal and contact layers of the standard cell and the tap cell. This conservative distance model may use more tap cells than necessary. Specify this option when the actual layout of the standard cell or the tap cell is not available in the cell library. The **-tap_distance_based** and **-drc_spacing_based** options are mutually exclusive. You can specify only one.

-drc_spacing_based

Selects the spacing design rule checking (DRC) based method to ensure design rule compliance. This method reads the actual layouts of the standard cells and the tap cells. The tool analyzes the diffusion layers, well layers, and contact layers to ensure spacing compliance. This results in inserting fewer tap cells because the tool recognizes an existing tap in a standard cell. The **-tap_distance_based** and **-drc_spacing_based** options are mutually exclusive. You can specify only one.

-move

Allows the moving of standard cells to avoid overlapping with the tap cells but might affect timing results of the design. The **-move** and **-freeze** options are mutually exclusive. You can specify only one.

-freeze

Disables the moving of standard cells during tap cells insertion. This option may insert more tap cells and may produce a placement with design rule violations. The **-move** and **-freeze** options are mutually exclusive. You can specify only one.

-tap_master *physical_lib_cell*

Specifies the library cell to be used as the tap cell master.

-tap_layer *layer_name*

Specifies the tap layer which contains the location of a tap in a cell. The tap layer typically has no physical correspondence to an actual mask layer.

-tap_distance_limit *distance*

Specifies the maximum spacing design rule between the standard cell and the tap cell.

-n_well_layer *layer_name*

Specifies the N-well layer only when you select the DRC spacing based tap cell insertion method.

-p_well_layer *layer_name*

Specifies the P-well layer only when you select the DRC spacing based tap cell insertion method.

-contact_layer *layer_name*

Specifies the metal to diffusion contact layer only when you select the DRC spacing based tap cell insertion method.

-p_diffusion_layer *layer_name*
Specifies the P-diffusion layer only when you select the DRC spacing based tap cell insertion method.

-n_diffusion_layer *layer_name*
Specifies the N-diffusion layer only when you select the DRC spacing based tap cell insertion method.

-p_Implant_layer *layer_name*
Specifies the P-Implant layer. Use this option only for a design with FRAM view in which P or N diffusions are on the same layer.

-n_Implant_layer *layer_name*
Specifies the N-Implant layer. Use this option only in the design with FRAM view in which P or N diffusions are on the same layer.

-tap_spacing_design_rule *distance*
Specifies the maximum spacing rule from a P or N diffusion to a substrate or well tap. Use this option only when the DRC spacing based tap cell insertion method is selected.

-tap.filler_name_identifier *prefix*
Specifies a name prefix to be used for inserted tap cells. You can use this prefix to find all inserted tap cells by name pattern matching.

-ignore_hard_blockage
Ignores hard blockages and place tap cells inside them.

-ignore_soft_blockage
Ignores soft blockages and place tap cells inside them.

-ignore_double_back_sharing
Disables the sharing of tap cells. By default, the tool assumes that taps can be shared with an adjacent row when using a double-back row structure. This results in insertion of fewer tap cells due to sharing. Use this option when the wells of a double-back row pair are not shared, and a tap from one row cannot be used for a different row.

-connect_to_power_net *power_net*
Specifies a net to which the power port of a tap cell is connected after insertion.

-connect_to_ground_net *ground_net*
Specifies a net to which the ground port of a tap cell is connected after insertion.

-no_tap_cells_under_metal_layer *metal_layers_list*
Disables the insertion of tap cells under specified metal layers where a preroute exists. The **metal_layers_list** argument is a list of layer names from the technology file. By default, the tool attempts to fill in areas under all metal layers.

-voltage_area *voltage_area_list*
Specifies the voltage areas where tap cells are inserted. Tap cells are not inserted outside the specified voltage areas. The value of **voltage_area_list**

must be a collection of voltage areas. By default, the tool insert tap cells in all voltage areas.

-respect_keepout

Respects hard and soft keepout margins on hard macros. The tool treats keepout areas as if they are occupied by a blockage. This option applies only to keepout margins on hard macros.

DESCRIPTION

This command inserts tap cells in a design while meeting the maximum spacing design rule between the diffusion and the tap cells. You typically use this command on a design after global placement is completed. A tap cell is a special non-logic cell with well and/or substrate ties. Tap cells are typically used when most or all of the standard cells in the library do not contain substrate or well taps. The design rule specifies the maximum spacing between every transistor of a standard cell and the well or substrate ties.

This command deploys two different insertion methods. The tap distance based method uses a simple distance model where the distance from a standard cell to a tap is not violated. This is a conservative tap insertion strategy. Use this method when the internal layout of a standard cell is not available.

The design rule checking (DRC) spacing based method reads the diffusion, well, and contact layers of the standard cell layout. By using intersection of the given layers, the P and N transistor diffusion area, the substrate and well contact locations are identified. The transistor diffusion area of a standard cell can use a tap inside another standard or tap cell. This method makes the most efficient use of tap cells and results in the insertion of fewer tap cells.

The **insert_tap_cells_by_rules** command can also connect the power or ground port of a tap cell to a specified power or ground net.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example inserts a tap cell named *MY_TAP* into a placed design where the distance from a standard cell to a tap cell is no more than 30.0 um, but does not place it under the metal layer named *metall1* where a preroute exists.

```
prompt> insert_tap_cells_by_rules -tap_master "MY_TAP" \
-tap_cell_insertion -tap_distance_based -move \
-tap_distance_limit 30.0 \
-no_tap_cells_under_metal_layer {metall1}
```

SEE ALSO

```
insert_stdcellFiller(2)
insert_wellFiller(2)
```

```
insert_tapCellsByRules
1102
```

insert_well_filler

Fills gaps between cells in the same row containing wells on the specified layer.

SYNTAX

```
status insert_well_filler
-layer layer_name_or_number
[-ignore_PRboundary]
[-fill_gaps_smaller_than gap_size]
[-higher_edge min | max]
[-lower_edge min | max]
-gap_type {tt | bb | tb | bt}
[-respect_blockages]
[-row_overlap {row_overlap_value}]
[-min_gap {min_gap_distance}]
[-max_gap {max_gap_distance}]
[-enclosure_only width]
```

Data Types

<i>layer_name_or_number</i>	string
<i>gap_size</i>	float
<i>row_overlap_value</i>	float
<i>width</i>	float

ARGUMENTS

-layer *layer_name_or_number*

Specifies the name or number of the well layer to be filled.

-ignore_PRboundary

Instructs the tool to ignore the PR boundary layer. By default, the tool respects the PR boundary (layer 207) and does not fill inside a PR boundary box that extends outside the cell.

-fill_gaps_smaller_than *gap_size*

Specifies that gap sizes less than the given threshold are to be filled. If a negative number or zero is entered, the default well spacing from the technology file is used. The default value is 1000.0.

-higher_edge min | max

Specifies the position of the higher edge of the well filler when the wells from the two standard cells do not line up. Use the keyword "min" or "max". If "min" is specified, the lower of the top edges of the two wells is used. If "max" is specified, the higher of the top edges of the two wells is used. The default is "min".

-lower_edge min | max

Specifies the position of the lower edge of the well filler when the wells from the two standard cells do not line up. Use the keywords "min" or "max". If "min" is specified, the lower of the bottom edges of the two wells is used. If "max" is specified, the higher of the bottom edges of the two wells is

used. The default is "min".

-gap_type {tt | bb | tb | bt}
 Indicates the type of gap to fill. This will fill the gaps between rows of wells in a specified layer.

-respect_blockages
 Specifies that placement blockages are not to be filled. By default placement blockages will be filled. This should be used only with gap_type option to fill between rows.

-row_overlap {row_overlap_value}
 Specifies the amount of space that the gap could overlap the row. A positive number overlaps the row. A negative number adds space between the row and the gap. The default value is 0.0 and is valid only when gap_type is used.

-min_gap {min_gap_distance}
 Specifies the minimum gap distance of the channel. If the channel is less than this distance then it is not filled. The default value is 0.0. This option is valid only with gap_type option.

-max_gap {max_gap_distance}
 Specifies the maximum gap distance of the channel. The default value is 0.0. This option is valid only with gap_type option.

-enclosure_only width
 Specifies the desired width of the enclosure.

DESCRIPTION

The **insert_well_filler** command fills gaps between cells either in the same row on the specified layer or between rows depending on which options are used. If the gap_type option is specified it fills gaps between rows otherwise gaps in the same row are filled. A well layer has a minimum spacing rule. Small gaps that violate the spacing rule need to be filled to avoid design rule errors. It is considered best practice to complete the routing before adding well fillers.

If the **-enclosure_only** option is turned on, this command adds a well enclosure around all standard cells in the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example fills the NWELL layer:

```
prompt> insert_well_filler -layer NWELL
```

The following example adds well fillers on layer 10 on gaps smaller than than 3.0um.

If the wells from the two standard cells do not line up, the tool creates the largest fill box by using the larger top edge and the smaller bottom edge.

```
prompt> insert_well_filler -layer 10 -fill_gaps_smaller_than 3.0 \
-higher_edge "max" -lower_edge "min"
```

The following example inserts well fillers between rows on layer NWELL:

```
prompt> insert_well_filler -gap_type TT -layer NWELL
```

The following example invokes a special well filler mode where a well enclosure of 2.0um is inserted to the left and right side of each standard cell on the NWELL layer.

```
prompt> insert_well_filler -layer {NWELL} -enclosure_only 2.0
```

SEE ALSO

```
insert_diode(2)
insert_metal_filler(2)
insert_ng_filler(2)
insert_pad_filler(2)
insert_stdcell_filler(2)
set_parameter(2)
```

insert_zrt_redundant_vias

Replaces single-cut vias with multiple-cut via arrays. It can also replace a single-cut via with another single-cut via that has a different contact code.

SYNTAX

```
status insert_zrt_redundant_vias
[-effort low | medium | high]
[-list_only]
[-timing_preserve_nets {collection_of_nets}]
[-timing_preserve_setup_slack_threshold slack_value]
[-timing_preserve_hold_slack_threshold slack_value]
```

Data Types

<i>collection_of_nets</i>	collection or list
<i>slack_value</i>	float

ARGUMENTS

- effort low | medium | high
 - Specifies the effort used to perform redundant via insertion. The default is medium.
- list_only
 - List the default via mappings to be used for redundant via insertion, but do not perform insertion.
- timing_preserve_nets {collection_of_nets}
 - Specifies the nets to preserve timing on. If you specify this option, the command will consider the specified nets as timing critical and will skip redundant via on them.
- timing_preserve_setup_slack_threshold *slack_value*
 - Specifies the slack threshold for timing critical nets. If you specify this option, the command will skip redundant via on all nets with worst setup slack less than or equal to this value.
- timing_preserve_hold_slack_threshold *slack_value*
 - Specifies the slack threshold for timing critical nets. If you specify this option, the command will skip redundant via on all nets with worst hold slack less than or equal to this value.

DESCRIPTION

This command replaces one set of vias in the design with another set. By default, all single-cut vias are replaced with 2-cut via arrays. You can change the behavior by using the **define_zrt_redundant_vias** command to specify the exact via mapping to be used by this command. From a netlist connectivity point of view, using a single-cut via is no different from using a multiple-cut via array, so additional via cuts in a multiple-cut via array are regarded as redundant vias from this point of view.

However, redundant vias can increase yield during manufacturing and are an important design-for-manufacturing (DFM) feature.

The vias are replaced only when the new via or via array does not introduce any design rule violations.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example replaces all single cut vias by 2-cut via arrays.

```
prompt> insert_zrt_redundant_vias
```

The following example replaces vias named VIA23 and VIA34 with vias named VIA23 and VIA34 that have corresponding x-sizes of 1 and 5 and y-sizes of 3 and 1.

```
prompt> define_zrt_redundant_vias -from_via {VIA23 VIA34} \
      -to_via {VIA23 VIA34} -to_via_x_size {1 5} \
      -to_via_y_size {3 1}
prompt> insert_zrt_redundant_vias
```

The following example replaces a via named VIA23 with a via named VIA23 that has a corresponding x-size of 1 and a y-size of 3.

```
prompt> define_zrt_redundant_vias -from_via VIA23 -to_via VIA23 \
      -to_via_x_size 1 -to_via_y_size 3
prompt> insert_zrt_redundant_vias
```

SEE ALSO

`define_zrt_redundant_vias(2)`

is_false

Tests the value of a specified variable, and returns a 1 if the value is 0 or the case-insensitive string *false*; returns a 0 if the value is 1 or the case-insensitive string *true*.

SYNTAX

```
int is_false  
value
```

Data Types

```
value      string
```

ARGUMENTS

value

Specifies the name of the variable whose value is to be tested.

DESCRIPTION

Tests the value of a specified variable, and returns a 1 if the value is either 0 or the case-insensitive string *false*. Returns a 0 if the value is either 1 or the case-insensitive string *true*. Any value other than 1, 0, *true*, or *false* generates a Tcl error message.

The **is_false** command is provided to use in writing scripts that test Boolean variables that can be set to 1, 0, or the case-insensitive strings *true* or *false*. When such variables are set to *true* or *false*, they cannot be tested in the negative in an **if** statement by simple variable substitution, because they do not constitute a true or false condition. The following example is not legal Tcl:

```
set x FALSE  
if {!$x} {  set y TRUE  
}
```

This results in a Tcl error message, indicating that you cannot use a non-numeric string as the operand of "!=". So, although you can test the positive condition, **is_false** allows you to test both conditions safely.

EXAMPLES

The following example shows the use of the **is_false** command.

```
prompt> set x TRUE  
TRUE
```

is_false

1108

```
prompt> if {![$is_false $x]} {  
?         set y TRUE  
?  
TRUE  
prompt>
```

SEE ALSO

[is_true\(2\)](#)

is_true

Tests the value of a specified variable, and returns a 1 if the value is 1 or the case-insensitive string *true*; returns a 0 if the value is 0 or the case-insensitive string *false*.

SYNTAX

```
int is_true
value
```

Data Types

value string

ARGUMENTS

value

Specifies the name of the variable whose value is to be tested.

DESCRIPTION

Tests the value of a specified variable, and returns a 1 if the value is either 1 or the case-insensitive string *true*. Returns a 0 if the value is either 0 or the case-insensitive string *false*. Any value other than 1, 0, *true*, or *false* generates a Tcl error message.

The **is_true** command is provided to use in writing scripts that test Boolean variables that can be set to 1, 0, or the case-insensitive strings *true* or *false*. When such variables are set to *true* or *false*, they cannot be tested in the negative in an **if** statement by simple variable substitution, because they do not constitute a true or false condition. The following example is not legal Tcl:

```
set x TRUE
if {!$x} {  set y FALSE
}
```

This results in a Tcl error message, indicating that you cannot use a non-numeric string as the operand of "!=". So, although you can test the positive condition, **is_true** allows you to test both conditions safely.

EXAMPLES

The following example shows the use of the **is_true** command.

```
prompt> set x FALSE
FALSE
prompt> if {[![is_true $x]} {
?           set y FALSE
```

? }

FALSE
prompt>

SEE ALSO

[is_false\(2\)](#)

is_zrt_routed_design

Checks if the current design is routed by Zroute.

SYNTAX

```
int is_zrt_routed_design
```

DESCRIPTION

This command checks if the current design is routed by Zroute. The top-level design must be open before you can run this command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command checks if the current design is routed by Zroute.

```
prompt> is_zrt_routed_design
```

```
is_zrt_routed_design  
1112
```

legalize_fp_placement

Resolves standard cell placement conflicts after performing an initial placement.

SYNTAX

```
status legalize_fp_placement
```

ARGUMENTS

The **legalize_fp_placement** command has no arguments.

DESCRIPTION

Resolves std cell placement conflicts after performing an initial placement. Overlaps are removed and std cells are placed at legal sites. This command will legalize the entire design and is meant for use during the floorplanning stage of design. For final implementation, use **legalize_placement** command instead.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

legalize_placement(2)

legalize_placement

Executes detailed placement on a design.

SYNTAX

```
status legalize_placement
[-effort low | medium | high]
[-check_only]
[-eco]
[-incremental]
[-cells cell_objects]
[-priority low | medium | high]
[-timing]
[-coordinates {llx1 lly1 urx1 ury1 ...}]
```

ARGUMENTS

-effort low | medium | high

Specifies the effort level for detailed placement. The default effort level is *medium*.

-check_only

Checks whether the design and the libraries have all the necessary information to run the command.

-eco

Derives locations for unplaced cells in the netlist. These cells are legally placed.

-incremental

This option specifies incremental legalization. This option is mainly used at the situation that most cells have already been legalized. This option will try to move as fewer cells as possible (but may be larger distance). A suitable situation to use this option is in post-route optimization. This option can also minimize the timing critical cell displacement if it is used combined with **-timing** option.

-cells *cell_objects*

This option will legalize a group of cells which have been specified by this option. This option will need to be used combined with the option **-priority**. If **-priority low** is specified, legalizer will legalize the cells without moving other existing cells. If **-priority high** is specified, the legalizer will try to move the cells in minimum distance by moving other existing cell away. If **-priority med** is specified, the legalizer will move both these cells and their surrounding cells.

-priority low | medium | high

This option is only used with **-cells** option together. This option specify the priority of a group of cells when this group of cells are being legalized. The default value is "low", i.e. legalizer will legalize the group of cells without moving other surrounding cells. If **-priority "med"** is specified, legalizer will move this group of cells and their surrounding cells when they

are being legalized. At this time, the cell movement will depend on their cell weights (cells are weighted by the worst pin slack as well as cell size). If -priority "high" is specified, legalizer will first snap these cells into their nearest legal locations, then move other cells at those locations to other legal locations.

-timing

This option is only used with -cells or -incremental option. This option will control the incremental legalization move less distance for the cells on critical paths, i.e. the cells are weighted by the worst pin slack as well as cell size. The incremental legalization will weight a cell only based on cell size if -timing is not specified.

-coordinates {llx1 lly1 urx1 ury1 ...}

Only used with -cells option. Specify the rectilinear region (multiple rectangles) so that the command only legalize the cells within the region. No cell will be moved outside the region, works like a fence to prevent cells move out of the region. The coordinate is the float_list of {x1 y1 x2 y2 ...}, unit of um.

DESCRIPTION

The **legalize_placement** command performs placement legalization on the current design, where coarse placement has already been performed. If no -eco specified, it is necessary to supply initial locations for every cell and blockage in the design before legalize. In addition, a **physical library** needs to be set using the physical_library variable. It is also necessary to specify a site array for the floorplan.

Also note that the option -timing can only be used together with -cells or -incremental option.

Note: After executing **legalize_placement**, all the timings are based on steiner routes of the design and any previous annotations are ignored.

Multicorner Multimode Support

This command uses information from all active scenarios.

EXAMPLES

The following example runs the **legalize_placement** command.

```
prompt> legalize_placement -effort high
```

SEE ALSO

```
current_design(2)  
create_placement(2)
```

lib2saif

Creates a forward-annotation SAIF file for a specified technology library.

SYNTAX

```
int lib2saif
[-output file_name]
library
[-lib_pathname lib_path_name]
```

Data Types

file_name	string
library	list
lib_path_name	list

ARGUMENTS

-output *file_name*
Specifies the name of the library forward-annotation SAIF file created by **lib2saif**. The default file name is the value of the variable **power_sspd_saif_file**. By default the value of the **power_sspd_saif_file** variable is *power_sspd.saif*.

library
Specifies the library name, or library file name for which the forward SAIF file is generated. If a library file name is specified then the library must be in .db format. The library must have state dependent leakage power characterization and/or pin-level state and/or path dependent internal power characterization for a library forward SAIF file to be generated.

-lib_pathname *lib_path_name*
Specifies the pathname to the simulation library information. This is optional, and is only required if the library is not in the simulation tool's current path during simulation.

DESCRIPTION

Creates a forward-annotation SAIF file that contains the state-dependent and path-dependent information for library cells. The library forward-annotation SAIF file is used in flows where a gate-level back-annotation SAIF file with state and/or path dependent switching activity is generated.

For details on the SAIF format, see the SAIF specification.

For details on state and path dependent power characterization, see the *Library Compiler Reference Manual* and the *Power Compiler Reference Manual*.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples illustrate the use of this command.

```
prompt> lib2saif -out a130.saif asic130_typical  
prompt> lib2saif -out a130.saif ../libs/asic130.db
```

SEE ALSO

```
report_power(2)  
set_switching_activity(2)  
power_sdpt_saif_file(3)
```

license_users

Lists the current users of the Synopsys licensed features.

SYNTAX

```
status license_users
[feature_list]
```

Data Types

feature_list list

ARGUMENTS

feature_list

Lists the licensed features for which to obtain the information. If more than one feature is specified, they must enclosed in braces ({}). See the *Synopsys Installation Guide: UNIX-Based Platforms* for a list of features supported by the current release, or determine from the key file all of the features that are licensed at your site.

DESCRIPTION

Displays information about all of the licenses, related users, and host names currently in use. If a feature list is specified, only information about those features is displayed.

The **license_users** command is valid only when Network Licensing is enabled.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In this example, all of the users of the Synopsys features are displayed:

```
prompt> license_users

krig@node1      Design-Analyzer, Design-Compiler, LSI-Interface
                  Test-Compiler, VHDL-Compiler
doris@node2     HDL-Compiler, Library-Compiler
test@node3      Design-Compiler, Design-Analyzer, TDL-Interface

3 users listed.
```

This example shows the users of the "Library-Compiler" or "VHDL-Compiler" feature.

```
prompt> license_users {Library-Compiler VHDL-Compiler}

krig@node1      Design-Analyzer, Design-Compiler, LSI-Interface
                  Test-Compiler, VHDL-Compiler
doris@node2     HDL-Compiler, Library-Compiler

2 users listed.
```

SEE ALSO

`get_license(2)`
`remove_license(2)`

link

Resolves design references.

SYNTAX

```
int link
[-force]
```

ARGUMENTS

-force

This is `icc_shell` only option. Without this option **link** command will not do anything in `icc_shell`. This option will force **link** command to resolve design references.

DESCRIPTION

Performs a name-based resolution of design references for the current design. For a design to be complete, it needs to be connected to all of the library components and designs it references. The references must be located and linked to the current design in order for the design to be functional. The purpose of this command is to locate all of the designs and library components referenced in the current design and connect (link) them to the current design.

The **link** command uses the system variables, **link_library** and **search_path**, and the **local_link_library** design attribute to resolve design references. The **local_link_library** and **link_library** variables specify a list of design and library files. A "*" entry in the value of the **link_library** variable indicates that **link** should search all the designs loaded in `dc_shell`. If the **link_library** has no "*" entry, the designs loaded in `dc_shell` are not searched. (The default for **link_library** is {your_library.db}.) The **search_path** variable specifies a list of directory names. When using this option, place the asterisk in quotes ("*").

If the reference is to a parameterized design (and the design is not already in memory), **link** automatically builds the template with the specified parameters. (Parameterized designs can only be specified using HDL code.)

If a **local_link_library** is set on the current design, it is added to the beginning of the **link_library** before the **link_library** is searched. The **link** command looks for the design references in the files specified first, by **local_link_library**, then by **link_library**. Simple filenames (those not containing directory or pathnames) are searched for in the directories specified in **search_path**. If the referenced design is not found in the link libraries, it looks for the referenced design in the **search_path** directories.

The order of directories in the **search_path** and of the files in the link libraries is important. Search order during a link is

1. local_link_library
2. link_library
3. search_path

The first occurrence of a design reference is used.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

In all modes, if design "top" refers to design "test" in its implementation, **link** must find and connect the design "test" to this reference. The **link** command first searches the files specified in the link libraries for "test". If it does not find "test" in the link libraries, it searches the directories specified in the **search_path** variable for a file named "test.db". If it does not find it there, a warning is issued stating that the reference cannot be resolved.

Assume that the **search_path**, **local_link_library**, and **link_library** variables for the previous example are set as follows:

```
prompt> search_path = {. synopsys_root + "/libraries" ~bill/project}
{.., /usr/synopsys/libraries, /usr/bill/project}

prompt> set_local_link_library tech1.lib.db
Setting local link library 'tech1.lib.db' on design 'top'

prompt> link_library = {"* tech2.lib.db ./project.db}
{* tech2.lib.db, ./project.db}
```

To find "test", the following sequence is performed:

Step 1.

Read the file "tech1.lib.db". Since this is a simple filename, the **search_path** is queried for the file location.

Step 2.

Search all the designs already loaded in dc_shell for a design called "test".

Step 3.

Read the file "tech2.lib.db". Since this is a simple filename, the **search_path** is queried for the file location.

Step 4.

Read the file "project.db" from the current directory. Since this is a complex filename (the current directory is specified), the **search_path** is not used to find the file.

Step 5.

Look for "test" in the list of designs contained in "tech1.lib.db", "tech2.lib.db", and "project.db".

Step 6.

If not found in Step 5, search for the file "test.db" using the **search_path**. The following contains examples of the **link** command for all modes.

Example 1

The **search_path** variable is set to a list of directories where designs and technology libraries reside. In the following example, "top", "counter", and "controller" designs are built using components from the **tech_lib** library. You need to read in only the top-level design. **link** automatically loads designs from both **link_library** files and, as needed, files in the **search_path**.

```
prompt> search_path = {. synopsys_root + "/libraries" /usr/bill}
{.., synopsys_root + "/libraries", /usr/bill

prompt> read top.db
Loading db file '/usr/bill/top.db'
{top}

prompt> link_library = {"**" tech_lib.db}
{**, tech_lib.db}

prompt> link
Loading db file '/usr/synopsys/libraries/tech_lib.db'
Linking design:
    top
Using the following designs and libraries:
    top, tech_lib (library)
Loading db file '/usr/bill/controller.db'
Loading db file '/usr/bill/counter.db'
```

Example 2

The following example shows that reading a design into dc_shell has no effect on the **link** command if the "*" is missing from the **link_library** variable. The design "adder" is read into the dc_shell explicitly, but cannot be found on the **search_path** or in the **link_library**. Therefore, it is unresolved during **link**.

The following example sets the **search_path** without including the directory of the file "adder.db":

```
prompt> search_path = {. synopsys_root + "/libraries" /usr/bill}
{.., /usr/synopsys/libraries, /usr/bill}
```

The following example reads design "adder" into dc_shell:

```
prompt> read /usr/bill/dc/adder.db
Loading db file '/usr/bill/dc/adder.db'
{adder, mux81}
```

The following example sets the **link_library** without including the file "adder.db" or "*" :

```
prompt> link_library = {tech_lib.db}
{tech_lib.db}
```

The following example sets the **current_design** variable:

```
prompt> current_design = top
top
```

The following example shows that **link** fails for designs in "adder.db":

```
prompt> link
Loading db file '/usr/synopsys/libraries/tech_lib.db'
Linking design:
    top
Using the following designs and libraries:
    tech_lib (library)
Warning: Unable to resolve reference 'adder' in design 'top'
Warning: Unable to resolve reference 'mux81' in design 'top'
```

The following example adds "*" to the **link_library** and the design links successfully:

```
prompt> link_library = "*" + link_library
{ "*", tech_lib.db}
prompt> link
Loading db file '/usr/synopsys/libraries/tech_lib.db'
Linking design:
    top
Using the following designs and libraries:
    top, tech_lib (library)
Loading db file '/usr/bill/controller.db'
Loading db file '/usr/bill/counter.db'
```

The following example adds "adder.db" to the **link_library**, which is another way to link successfully:

```
prompt> link_library = {tech_lib.db, /usr/bill/dc/adder.db}
{tech_lib.db, /usr/bill/dc/adder.db}
prompt> link
Loading db file '/usr/synopsys/libraries/tech_lib.db'
Linking design:
    top
Using the following designs and libraries:
    tech_lib (library), /usr/bill/dc/adder.db
Loading db file '/usr/bill/controller.db'
Loading db file '/usr/bill/counter.db'
```

Example 3

This example shows how to handle files with multiple designs. If you need to link with a file of multiple designs, put that file in your **link_library**.

If a design is not found in the **link_library** files, **link** searches the **search_path** directories only for a file of the same name as the referenced design. If your multiple-design file has a different file name, it will not be found, even if it is located on the **search_path**.

```
prompt> search_path = {. synopsys_root + "/libraries" /usr/project}
{., /usr/synopsys/libraries, /usr/project}
```

The following example sets the **link_library** without including "mylib.db":

```
prompt> link_library = {tech_lib.db}
{tech_lib.db}
```

The link fails for designs in "mylib" that are neither in **link_library** files nor found on the **search_path**.

```
prompt> link
Loading db file '/usr/synopsys/libraries/tech_lib.db'
Linking design:
    top
Using the following designs and libraries:
    tech_lib (library)
Warning: Unable to resolve reference 'adder' in design 'top'
Warning: Unable to resolve reference 'mux81' in design 'top'
Warning: Unable to resolve reference 'counter' in design 'top'
```

Because some of the designs are in "mylib.db", adding this file to the **link_library** enables a successful link:

```
prompt> link_library = {tech_lib.db mylib.db}
{tech_lib.db, mylib.db}
prompt> link
Loading db file '/usr/synopsys/libraries/tech_lib.db'
Linking design:
    top
Using the following designs and libraries:
    tech_lib (library), mylib, adder
Loading db file '/usr/bill/controller.db'
Loading db file '/usr/bill/counter.db'
```

Instead, add "*" to the **link_library** and the design links successfully:

```
prompt> link_library = "*" + link_library
{"*", tech_lib.db}
prompt> link
Loading db file '/usr/synopsys/libraries/tech_lib.db'
Linking design:
    top
Using the following designs and libraries:
    mylib, adder, tech_lib (library)
Loading db file '/usr/bill/controller.db'
Loading db file '/usr/bill/counter.db'
```

link_library(3)
search_path(3)

link_physical_library

Links the physical library with the logical library for physical synthesis.

SYNTAX

```
int link_physical_library
```

ARGUMENTS

There are no arguments to this command.

DESCRIPTION

The **link_physical_library** command links the logical library and physical library, linking library cells and pins by name. Normally, any physopt command will implicitly do the linking for you. If you want to explicitly link the libraries, use this command. If the libraries are already linked, this command will do nothing.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The **search_path** variable is set to a list of directories where designs and technology libraries reside. The following example shows how to link the logical library with the physical library.

```
prompt> set search_path = ". synopsys_root/libraries /usr/bill"
prompt> set target_library = mylib.db
prompt> set physical_library = mylib.pdb
prompt> read_db mydesign.db
prompt> link_physical_library
```

SEE ALSO

[search_path\(3\)](#)
[target_library\(3\)](#)

list_attributes

Lists the currently defined attributes.

SYNTAX

```
string list_attributes
[-application]
[-class class_name]
[-nosplit]
```

Data Types

class_name string

ARGUMENTS

```
-application
    Lists application attributes and user-defined attributes.

-class class_name
    Limits the listing to attributes of a single class. Valid classes are design,
    port, cell, net, etc.
```

DESCRIPTION

The **list_attributes** command displays an alphabetically sorted list of currently defined attributes. The attributes are divided into two categories: application-defined and user-defined. By default, **list_attributes** lists all user-defined attributes.

Using the **-application** option adds all application attributes to the listing. Since there are many application attributes, you can limit the listing to a specific object class using the *class_name* argument.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example listing of some attributes defined with the **define_user_attribute** command:

```
prompt> list_attributes
*****
Report : List of Attribute Definitions
Design :

list_attributes
1126
```

```
*****
```

Properties:

A - Application-defined
U - User-defined
I - Importable from db (for user-defined)

Attribute Name	Object	Type	Properties	Constraints
<hr/>				
attr_b	cell	boolean	U	
attr_d	cell	double	U	
attr_f	cell	float	U	
attr_i	cell	int	U, I	
attr_ir1	cell	int	U	0 to 100
attr_ir2	cell	int	U	>= 0
attr_ir3	cell	int	U	<= 100
attr_oo	cell	string	U	A, B, C, D
attr_s	cell	string	U	
attr_s	net	string	U	

The following example adds application-defined attributes, but limits the listing to net attributes only:

```
prompt> list_attributes -application -class net
```

```
*****  
Report : List of Attribute Definitions  
Design :  
*****
```

Properties:

A - Application-defined
U - User-defined
I - Importable from db (for user-defined)

Attribute Name	Object	Type	Properties	Constraints
<hr/>				
area	net	float	A	
attr_s	net	string	U	
ba_capacitance_max	net	float	A	
ba_capacitance_min	net	float	A	
ba_resistance_max	net	float	A	
ba_resistance_min	net	float	A	
base_name	net	string	A	
full_name	net	string	A	
net_resistance_max	net	float	A	
net_resistance_min	net	float	A	
object_class	net	string	A	
pin_capacitance_max	net	float	A	
pin_capacitance_min	net	float	A	
total_capacitance_max	net	float	A	
total_capacitance_min	net	float	A	
wire_capacitance_max	net	float	A	
wire_capacitance_min	net	float	A

list_designs

List the designs available in memory.

SYNTAX

```
int list_designs  
[design_list]  
[-show_file]
```

Data Types

design_list list

ARGUMENTS

design_list

Specifies the designs to list. If this option is not specified, all designs are listed. When specifying designs, the wildcard characters * (asterisk) and ? (question mark) are supported. For details about using and escaping wildcard characters, refer to the **wildcards** man page.

-show_file

Specifies that designs are shown according to the file in which they reside. The **-show_file** option is typically used when two or more designs share the same name.

DESCRIPTION

The **list_designs** command displays the designs currently read in dc_shell. In the design listing, the current design is designated by an asterisk.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **list_designs**.

```
prompt> list_designs  
ADDER          FULL_SUBTRACTOR      HALF_SUBTRACTOR      TOP  
FULL_ADDER     HALF_ADDER          SUBTRACTOR  
  
prompt> current_design TOP  
Current design is 'TOP'.
```

The following example shows that the current design is denoted with an asterisk:

```
prompt> list_designs
ADDER          FULL_SUBTRACTOR    HALF_SUBTRACTOR    TOP (*)
FULL_ADDER     HALF_ADDER        SUBTRACTOR
```

The following example lists all designs that end with _ADDER:

```
prompt> list_designs "*_ADDER"
HALF_ADDER    FULL_ADDER
```

The following example uses -show_file to differentiate between designs having the same name:

```
prompt> list_designs
ADDER          FULL_SUBTRACTOR    HALF_SUBTRACTOR    TOP
FULL_ADDER     HALF_ADDER        SUBTRACTOR

prompt> copy_design TOP example.db:TOP
Copying design 'TOP' to 'example.db:TOP'

prompt> list_designs
ADDER          FULL_SUBTRACTOR    HALF_SUBTRACTOR    TOP
FULL_ADDER     HALF_ADDER        SUBTRACTOR        TOP (*)

prompt> list_designs -show_file
/usr/users/bill/test/designs/top.db
ADDER          FULL_SUBTRACTOR    HALF_SUBTRACTOR    TOP (*)
FULL_ADDER     HALF_ADDER        SUBTRACTOR

example.db
TOP
```

[current_design\(2\)](#)
[list_instances\(2\)](#)
[wildcards\(3\)](#)

list_drc_error_types

Lists error type names

SYNTAX

```
list list_drc_error_types
[-error_view mw_error_view]
[-class type_class]
[-name type_name]
[-id]
```

Data Types

<i>mw_error_view</i>	list collection
<i>type_class</i>	list
<i>type_name</i>	list

ARGUMENTS

-error_view *mw_error_view*

Specify the error view on which to list the error types. If omitted, the error types from the current top-level design cell are listed. Specifying more than one error view causes an error.

-class *type_class*

One or more of the type classes {Default, Open, OpenLocator, Short, Spacing}. Type class name keywords are case insensitive. Only the error types in the specified classes are listed. If omitted, all types are listed.

-name *type_name*

One or more type names to list. This option is useful only if you are listing type ids. Type names are case sensitive. Only the error types with the given names are listed.

-id

If this Boolean option is given, type ids, rather than type names, are listed. While it is not possible to create multiple types with the same name using the public Tcl API, there are existing error view writers which create error views with multiple error types sharing the same name. This command along with the -name and the -id option can be used to list the ids sharing type names.

DESCRIPTION

This command returns a list of error types in the given error view by name or id.

SEE ALSO

[create_drc_error_type\(2\)](#)
[report_drc_error_type\(2\)](#)

list_files

Lists the files that are loaded into memory.

SYNTAX

```
integer list_files
```

ARGUMENTS

The **list_files** command has no arguments.

DESCRIPTION

The **list_files** command lists the files loaded in dc_shell.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the output from **list_files**:

```
prompt> list_files

  File          Path
  ----         -----
adder.db      /remote/usr4/joeuser/designs
clock.db      /remote/usr4/joeuser/designs
gtech.db      /remote/usr4/joeuser/libraries
lsi_10k.db    /remote/usr4/joeuser/libraries
```

SEE ALSO

[list_designs\(2\)](#)
[list_licenses\(2\)](#)

list_floorplan_data

Lists the currently defined floorplan data attribute names.

SYNTAX

```
string list_floorplan_data
[-module top | child_cell | plan_group]
[-view one_level | logical | physical]
```

ARGUMENTS

```
-module top | child_cell | plan_group
    Specifies the module type on which the floorplan data attribute names are
    listed.
    The default value of this option is top.
```

```
-view one_level | logical | physical
    Specifies the view in which floorplan data attribute names are listed.
    When you specify one_level (the default), the data attribute names are listed
    if they are defined in the first level of hierarchy in the module.
    When you specify logical or physical, the data attribute names are listed if
    they are defined in any level of hierarchy in the module. The difference
    between logical and physical is that soft macros are traversed in the physical
    view, but not in the logical view.
    This option is ignored if you specify -module plan_group, because plan groups
    have only a logical view.
```

DESCRIPTION

The **list_floorplan_data** command displays an alphabetically sorted list of currently defined floorplan data attribute names. To query the value of a data attribute on a specified object, use the **get_floorplan_data** command.

For more information about floorplan data attributes, see the **floorplan_data_attributes** man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example lists the names of all floorplan data attributes that have been defined on the top module in the the one-level view, and then gets the physical_area value.

```
prompt> list_floorplan_data -module top -view one_level
          hard_macro_area_percentage
          macro_area_percentage
          number_of_black_box
```

```

number_of_hard_macro
number_of_io_cell
number_of_macro
number_of_standard_cell
physical_area

prompt> get_floorplan_data -module [current_mw_cel] \
-view one_level physical_area
388.815300

```

The following example lists the names of all floorplan data attributes that have been defined on the top module in the logical view and gets the physical_area and area values. The example also tries to get the area value from the one-level view, but cannot because it does not exist.

```

prompt> list_floorplan_data -module top -view logical
area
aspect_ratio
hard_macro_area_percentage
macro_area_percentage
number_of_black_box
number_of_hard_macro
number_of_io_cell
number_of_macro
number_of_standard_cell
physical_area

prompt> get_floorplan_data -module [current_mw_cel] \
-view logical physical_area
2084312.873500

prompt> get_floorplan_data -module [current_mw_cel] \
-view logical area
5707320.000000

prompt> get_floorplan_data -module [current_mw_cel] \
-view one_level area
Error: Data name area for class mw_cel in view one_level is invalid. (MWUI-044)

```

SEE ALSO

`get_floorplan_data(2)`

`floorplan_data_attributes(3)`

list_instances

Lists the instances in the current design or current instance.

SYNTAX

```
int list_instances
[instance_list]
[-hierarchy]
[-max_levels num_levels]
[-full]
```

Data Types

<i>instance_list</i>	list
<i>num_levels</i>	integer

ARGUMENTS

instance_list

Specifies the instances to list. By default, all instances in the current design or current instance are listed.

-hierarchy

Lists all levels of instance hierarchy. By default, only the current level of hierarchy is listed.

-max_levels *num_levels*

Modifies the **-hierarchy** option by specifying a limit to the number of levels of hierarchy listed, so the **-max_levels** option is significant only if used with the **-hierarchy** option.

-full

Displays the full hierarchy. By default, if there is a submodule in multiple locations in a hierarchy, its components are listed only once, with an ellipsis (...) indicating the contents of a previously displayed module.

DESCRIPTION

The **list_instances** command lists the instances in memory. The command displays cells at the current level of hierarchy, as specified by **current_design** and **current_instance**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses **list_instances** to display the available instances. The

design that each instance references is shown in parentheses following the instance name.

```
prompt> current_design TOP
Current design is 'TOP'.

prompt> list_instances
U1 (ADDER)      U2 (SUBTRACTOR)

prompt> current_instance U1
Current instance is 'TOP/U1'.

prompt> list_instances
U1 (FULL_ADDER)      U2 (FULL_ADDER)
U3 (FULL_ADDER)      U4 (FULL_ADDER)

prompt> list_instances {U1, U2}
U1 (FULL_ADDER)      U2 (FULL_ADDER)

prompt> current_instance U2
"TOP/U1/U2"

prompt> list_instances **
U1 (HALF_ADDER)      U2 (HALF_ADDER)      U3 (OR2)
```

The following examples use **-hierarchy** to display multiple levels of the instance hierarchy. All instances at each level of hierarchy are listed as a group.

```
prompt> current_instance
Current instance is the top level of design 'TOP'.

prompt> list_instances -hierarchy
U1 (ADDER)
  U1 (FULL_ADDER)
    U1 (HALF_ADDER)
      U1 (EO)          U2 (AN2)
      U2 (HALF_ADDER) ...
    U3 (OR2)
    U2 (FULL_ADDER) ...
    U3 (FULL_ADDER) ...
    U4 (FULL_ADDER) ...
U2 (SUBTRACTOR)
  U1 (FULL_SUBTRACTOR)
    U1 (HALF_SUBTRACTOR)
      U1 (EO)          U2 (IV)          U3 (AN2)
      U2 (HALF_SUBTRACTOR) ...
    U3 (OR2) ...
    U2 (FULL_SUBTRACTOR) ...
    U3 (FULL_SUBTRACTOR) ...
    U4 (FULL_SUBTRACTOR) ...

prompt> list_instances -hierarchy -max_levels 2
U1 (ADDER)
```

```

U1 (FULL_ADDER) ...
U2 (FULL_ADDER) ...
U3 (FULL_ADDER) ...
U4 (FULL_ADDER) ...

U2 (SUBTRACTOR)
U1 (FULL_SUBTRACTOR) ...
U2 (FULL_SUBTRACTOR) ...
U3 (FULL_SUBTRACTOR) ...
U4 (FULL_SUBTRACTOR) ...

prompt> current_instance U1/U1
Current instance is 'TOP/U1/U1'.

prompt> list_instances -hierarchy
U1 (HALF_ADDER)
    U1 (EO)          U2 (AN2)
U2 (HALF_ADDER) ...
U3 (OR2)

prompt> list_instances -hierarchy -full
U1 (HALF_ADDER)
    U1 (EO)          U2 (AN2)
U2 (HALF_ADDER)
    U1 (EO)          U2 (AN2)
U3 (OR2)

```

[current_instance\(2\)](#)
[list_designs\(2\)](#)
[wildcards\(3\)](#)

list_libs

Lists the libraries available in memory.

SYNTAX

```
status list_libs
[lib_list]
```

Data Types

lib_list list

ARGUMENTS

lib_list

Specifies the libraries to list. You can use the * (asterisk) and ? (question mark) wildcard characters when specifying the libraries to list. For more details about using and escaping wildcards see the man page for the **wildcards** variable. By default, the tool lists all libraries.

DESCRIPTION

This command displays all libraries that are currently available in memory.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example shows a simple use of the **list_libs** command. The library flagged with M is the maximum library used for maximum delay analysis. It corresponds to the library flagged with m used for minimum delay analysis.

```
prompt> set_min_library sc_max.db -min sc_min.db
prompt> set_min_library tt_max.db -min tt_min.db
prompt> list_libs
Logical Libraries:
-----
Library      File          Path
-----      ----          ---
  cell        cells.db      /remote/usr4/joeuser/designs
  gtech       gtech.db      /remote/usr4/joeuser/libraries
  standard.sldb standard.sldb /remote/usr4/joeuser/libraries
M fs120_max   sc_max.db    /remote/usr4/joeuser/libraries
m fs120_min   sc_min.db    /remote/usr4/joeuser/libraries
M cb_max      tt_max.db    /remote/usr4/joeuser/libraries

list_licenses

Displays a list of licenses currently checked out by the user.

SYNTAX

```
status list_licenses
```

ARGUMENTS

The **list_licenses** command has no arguments.

DESCRIPTION

The **list_licenses** command lists the licenses you currently have checked out. If more than one copy of a license key is checked out then the number of keys checked out is shown in parentheses following the license name.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the output from **list_licenses**.

```
prompt> list_licenses

License in use:
    Galaxy-Common
    Galaxy-ICC
1
```

SEE ALSO

```
check_license(2)
get_license(2)
license_users(2)
remove_license(2)
```

list_mw_cels

Prints the list of Milkyway designs in the current Milkyway library.

SYNTAX

```
status list_mw_cels
[-all_views]
[-all_versions]
[-sort]
```

ARGUMENTS

-all_views
List all views of Milkyway designs in the current Milkyway library. If specifying this option without **-all_versions** option, the version number will not be listed.

-all_versions
List all versions of Milkyway designs in the current Milkyway library. If specifying this option without **-all_views** option, the designs of CEL view will only be listed.

-sort
Sort the list by alphabet.

DESCRIPTION

This command prints the list of Milkyway designs in the current Milkyway library. The library must be open. And note that it will show the design name if any view of the design exists in the library. It also prints the following information about the Milkyway design:

- **open** if it is an open Milkyway design.
- **read_only** if it is opened in read only mode.
- **current** if it is the currently active Milkyway design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example lists the Milkyway designs in the current library:

```
prompt> list_mw_cels
top
AND
NOR
1
prompt> list_mw_cels -all_views
top.CEL
AND.CEL
NOR.CEL
NOR.FRAME
1
prompt> list_mw_cels -all_versions
top.CEL;1
top.CEL;2
AND.CEL;1
NOR.CEL;1
1
prompt> list_mw_cels -all_views -all_versions -sort
AND.CEL;1
NOR.CEL;1
NOR.FRAME;1
top.CEL;1
top.CEL;2
1
```

SEE ALSO

get_mw_cels(2)

list_partition_data

Queries a partition browser and returns data from it.

SYNTAX

```
status list_partition_data
[-top_blocks]
[-IOs]
[-hard_macros]
[-missing_modules]
[-top_hard_macros]
[-sub_blocks]
[-area cells_only | boundary | include_external_keepout]
[-power_ports]
[-ground_ports]
[-
instance_count all | std_cells | hard_macros | IOs | modules | missing | black_box]
[-keepouts]
[-utilization]
[-tcl_output]
[-verbose]
[module_name_list]
```

Data Types

module_name_list string list

ARGUMENTS

-top_blocks

Asks the command to return the top blocks from the partition. Top blocks are blocks that have a module definition but for which there are no instances in any other module. Typically, there is a single top block, which is the root of the design. You can easily end up with multiple top blocks if, for example, the top module itself is missing.

-IOs

Asks the command to return the I/O cells and the count of each I/O cell from the modules in the *module_name_list*.

-hard_macros

Asks the command to return the hard macro cells and the count of each hard macro from the modules in the *module_name_list*.

-missing_modules

Asks the command to return the missing modules in the *module_name_list*. Missing modules are those modules that have no definition and no area in Verilog.

-top_hard_macros

Asks the command to return the hard macros that reside at the top-level of design.

-sub_blocks
Asks the command to return the subblocks from the partition. Subblocks are physical and logical blocks that are not top blocks. Use this option to determine which blocks have become physical blocks after some form of autopartitioning.

-area cells_only | boundary | include_external_keepout
Asks the command to return the area of the given modules. The *cells_only* argument includes only the area of cells in the given modules; the *boundary* argument considers the utilization of the modules and also the internal keepout set on the modules; and the *include_external_keepout* argument considers the boundary area and also the external keepout set on the modules. This information can be used after partitioning to determine the required area of the physical blocks.

-power_ports
Asks the command to return the power ports of the named modules. These are computed through an analysis of the leaf-cell library cells, so it will not work for a module that is "missing". This is used to do a better job of determining the defaults for power-network synthesis and analysis.

-ground_ports
Asks the command to return the ground ports of the named modules. These are computed through an analysis of the leaf-cell library cells, so it will not work for a module that is "missing." This is used to do a better job of determining the defaults for power network synthesis and analysis.

-instance_count all | std_cells | hard_macros | IOs | modules | missing | black_box
Asks the command to return the specified instance count for the modules in the *module_name_list*. This count is the total number of cells that are in the subhierarchy rooted at the given module(s). The *all* argument considers all types of physical cells; the *std_cells* argument considers only standard cells; the *hard_macros* argument considers only hard macros; the *IOs* argument considers only I/O cells; the *modules* argument considers all modules; and the *missing* argument considers only missing modules. Missing modules are modules that have no definition and no area. The *black_box* argument considers missing modules that have been assigned an area. The area is assigned using by using the **create_partition -area** command.

-keepouts
Asks the command to return the external and internal keepouts for the given modules. These keepouts can be set by the **create_partition** command. The default value is 0.

-utilization
Asks the command to return the utilization (expressed as a fraction between 0 and 1) for the given modules. If these have not been modified through the partition or a previous **create_partition** command, the values will be the default used when the partition was created. The default in this case is 0.7 (70 percent).

-tcl_output
Asks the command to output its results in a tcl format. See the example below for details.

```

-verbose
    When this option is set, the list_partition_data command will output more
    detailed messages.

module_name_list
    This is the list of modules from which requested data is gathered and
    returned. By default, it is the top-level module(s).

```

DESCRIPTION

This command is used to query a partition and return data from it. It is needed because much of the data on the browser is computed or derived from autopartitioning. This command is used mainly in flows to retrieve data from a partition to control subsequent steps within the flow. For example, after autopartitioning, this command will return the set of subblocks within the partitioning, as well as the area for each of the subblocks. The area can be used by a subsequent top-down block shaping to keep the proper area for the subblock footprints.

EXAMPLES

If you use the **list_partition_data** command with the following:

```

prompt> open_mw_lib myDesign.mw
{myDesign.mw}
prompt> create_partition -input_files {../ICC_DATA/Netlist/myDesign.v}
Partitioner Name: pfe0
Loading verilog file ../ICC_DATA/Netlist/myDesign.v
MYDESIGN: 73977 instances of 134 modules.
1
prompt> create_partition -auto_partition instance_count
After partitioning, list of sub-blocks is BLENDER_0 BLENDER_1 BLENDER_2 BLENDER_3
1

```

Then for the subblocks you can ask:

```

prompt> list_partition_data -sub_blocks
BLENDER_0 BLENDER_1 BLENDER_2 BLENDER_3

```

Here is an example where you can ask for multiple pieces of data at the same time:

```

prompt> list_partition_data -instance_count all -
area boundary "BLENDER_0 PCI_CORE SDRAM_IF"
module BLENDER_0
    BoundaryArea: 333551 InstanceCount: 11039
module PCI_CORE
    BoundaryArea: 253270 InstanceCount: 7579
module SDRAM_IF
    BoundaryArea: 260616 InstanceCount: 8086

```

In the case where information is output in a tcl format, the result is:

```

prompt> list_partition_data -area boundary -instance_count all -

```

```
tcl_output "BLENDER_0 PCI_CORE SDRAM_IF"
{
    {BLENDER_0
        {BoundaryArea 333551 InstanceCount 11039}}
    {PCI_CORE
        {BoundaryArea 253270 InstanceCount 7579}}
    {SDRAM_IF
        {BoundaryArea 260617 InstanceCount 8086}}
}
```

Note that the brace indentation has been modified to make the example more readable. This version is more suited to storage within a tcl variable for subsequent retrieval within tcl.

lminus

Removes one or more named elements from a list and returns a new list.

SYNTAX

```
list lminus
[-exact] the_list elements
```

Data Types

```
the_list      list
elements     list
```

ARGUMENTS

the_list
Specifies the list to copy and modify.

elements
Specifies a list of elements to remove from *the_list*.

DESCRIPTION

The **lminus** command removes elements from a list by using the element itself, rather than the index of the element in the list (as in **lreplace**). **lminus** uses the commands **lsearch** and **lreplace** to find the elements and replace them with nothing. If none of the elements are found, a copy of *the_list* is returned. The **lminus** command is often used in the translation of Design Compiler scripts that use the subtraction operator (-) to remove elements from a list.

EXAMPLES

The following example shows the use of the **lminus** command. Notice that no error message is issued if a specified element is not in the list.

```
prompt> set 11 {a b c}
a b c
prompt> set 12 [lminus $11 {a b d}]
c
prompt> set 13 [lminus $11 d]
a b c
```

Example below illustrates the usage of *-exact* option with lminus.

```
prompt> set 11 {a a[1] a* b[1] b c}
a a[1] a* b[1] b c
prompt> set 12 [lminus $11 a*]
{b[1]} b c
prompt> set 13 [lminus -exact $11 a*]
a {a[1]} {b[1]} b c
```

```
prompt> set 14 [lminus -exact $11 {a[1] b[1]}]
a a* b c
```

SEE ALSO

load_fp_rail_map

Loads a voltage (IR) drop, electromigration (EM), resistance map or instance based voltage (IR) drop, power or power density map for display.

SYNTAX

```
status load_fp_rail_map
[-nets net_name]
[-instance]
[-type map_type]
[-min min_value]
[-max max_value]
[-directory directory_name]
[-clear]
```

Data Types

<i>net_name</i>	string
<i>map_type</i>	string
<i>min_value</i>	float
<i>max_value</i>	float
<i>directory_name</i>	string

ARGUMENTS

-nets *net_name*

Enter the name of the power or ground net for which you want to load the rail analysis results for displaying the voltage drop map. Only a single net is allowed at a time. For example, if "-nets {VDD VSS}" is specified, the first VDD net is selected.

-instance

Use this option to display instance based voltage (IR) drop, power, or power density maps. This option is mutually exclusive with the **-nets** option.
exclusive with "**-nets**" option.

-type *map_type*

Specify a keyword "IR, EM, R, P, PD or InstIR" for the type of map you want to load. By using this option, a voltage (IR) drop, electromigration (EM) violations rail, resistance (R), instance power (P), instance power density (PD), or instance IR drop (InstIR) will be loaded for display in the GUI. The default for a net based map is **IR**. The default for an instance based map is **InstIR**.

-min *min_value*

Enter a value for the minimum voltage drop limit in millivolts (mV). By default, it is automatically set based on power rail synthesis or analysis results from a specified directory. There is no limit for this value. Note that if "min_value" > "max_value", then both values are exchanged to display data correctly.

```

-max max_value
    Enter a value for the maximum voltage drop limit in millivolts (mV). By default, it is automatically set based on power rail synthesis or analysis results from a specified directory. There is no limit for this value. Note that if "min_value" > "max_value", then both values are exchanged to display data correctly.

-directory directory_name
    Specify the directory which stores IR/EM results with the file name design_name.net_name.pw_hl.pna and the power allocation results with the file name design_name.net_name.power. For an instance-based map, the file name is design_name.inst_hl.pna. The default is ./pna_output.

-clear
    Removes a map which was previously loaded. By default, this option is off.

```

DESCRIPTION

After rail analysis is complete, you can load a voltage drop(IR), electromigration(EM), or resistance (R) distribution in your design. You can also load instance based voltage drop (InstIR), instance power (P) or instance power density (PD) map for display through the GUI.

This command loads voltage drop values, EM values, resistance values, power or power density in the design to set increments between the maximum and minimum value limits that you specify.

The tool performs voltage drop analysis by retrieving the database objects that belong to the power and ground net to be analyzed and builds a resistive network through parasitic extraction. All cell instances are treated as equivalent current sources, and their values are derived from the power consumption values you specify. Using the current source values, the tool determines the voltage drop for each cell instance, and then it calculates the current flow and current density along each power and ground segment.

Multicorner Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example shows how to load a IR map of a net VDD, with the minimum IR drop value **0.1**, the maximum IR drop value **100** and a directory which stores voltage (IR) drop results,

```

prompt> load_fp_rail_map \
-nets VDD \
-min 0.1 \
-max 100 \
-directory ./pna_output_2 \

```

The following example shows how to load a resistance map of a net VDD.

```
prompt> load_fp_rail_map \  
-nets VDD \  
-type R \  

```

The following example shows how to load a instance voltage drop map.

```
prompt> load_fp_rail_map \  
-instance \  
-type InstIR \  

```

SEE ALSO

`analyze_fp_rail(2)`
`synthesize_fp_rail(2)`

load_of

Returns the capacitance of the specified library cell pin.

SYNTAX

```
float load_of  
library_cell_pin
```

Data Types

library_cell_pin string

ARGUMENTS

library_cell_pin

The name of the library cell pin whose capacitance is to be returned. The format for *library_cell_pin* is similar to that of the **find** command:
library_name/lib_cell_name/pin_name. (The specified library must be already loaded into dc_shell.)

DESCRIPTION

Returns the load of a given library cell pin. It is primarily used as an argument to the **set_load** command. If the specified *library_cell_pin* cannot be found, a warning message is issued and 0.0 is returned.

EXAMPLES

The following command returns the pin load of a lib_cell from the tech_lib.

```
prompt> load_of tech_lib/lib_cell/pin
```

The following example uses this command with the **set_load** command. It sets the load on all output ports to the value of the inverter cell input from the tech_lib.

```
prompt> set_load load_of( tech_lib/inverter/input) all_outputs()
```

SEE ALSO

`set_load(2)`

load_upf

Reads a script in the Unified Power Format (UPF). This command is supported only in UPF mode.

SYNTAX

```
status load_upf
upf_file_name
[-scope instance_name]
[-noecho]
```

Data Types

<i>upf_file_name</i>	string
<i>instance_name</i>	string

ARGUMENTS

<i>upf_file_name</i>	Specifies the name of the file that contains the UPF script to be read.
<i>-scope instance_name</i>	Specifies the scope where the UPF commands contained in the specified <i>upf_file_name</i> are to be executed.
<i>-noecho</i>	Instructs load_upf not to echo the commands as the UPF file is loaded.

DESCRIPTION

The **load_upf** command sets the scope to the specified instance and executes the set of UPF commands in the specified UPF file. Upon completion, the current scope is restored to the value it was prior to the invocation of **load_upf**. When the **-scope** option is not specified, the current scope is used.

The **load_upf** command executes the constraints as they are being read. If errors are encountered when the UPF file is being read, it is possible that only some of the constraints are applied.

The **load_upf** command supports following UPF commands. Usage of some of these commands is restricted when reading the UPF file. In certain cases, some command options are not supported.

<i>add_port_state</i>
<i>add_pst_state</i>
<i>bind_checker</i>
<i>connect_supply_net</i>
<i>create_upf2hdl_vct</i>
<i>create_hdl2upf_vct</i>
<i>create_power_domain</i>

```
create_power_switch
create_pst
create_supply_net
create_supply_port
load_upf
map_isolation_cell
map_level_shifter_cell
map_power_switch
map_retention_cell
name_format
save_upf
set_scope
set_isolation
set_isolation_control
set_retention
set_retention_control
set_domain_supply_net
set_design_top
set_level_shifter
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example loads the UPF script file named top.upf:

```
prompt> load_upf top.upf
```

Loading UPF file top.upf with version 1.0...

```
End loading UPF file top.upf
1
```

The following example shows the usage of the **-scope** option of the **load_upf** command:

```
prompt> load_upf top.upf -scope Afp
```

Loading UPF file top.upf with version 1.0...

```
End loading UPF file top.upf
1
prompt>
```

The following example reads the UPF script file named top2.upf that contains commands not supported by UPF. The CMD-005 error messages are generated for the unsupported commands.

```
prompt> load_upf top2.upf
```

```
Loading UPF file top2.upf with version 1.0...
link_design
Error: Unknown command 'link_design' (CMD-005)

End loading UPF file top2.upf
0
prompt>
```

The following example shows the behavior of **load_upf** when the UPF file contains commands not supported by the tool. One UPF message is generated for every unsupported command. When the execution of the **load_upf** command is complete, the tool also reports a summary of all unsupported commands encountered in the UPF file.

```
prompt> load_upf t2.upf

Loading UPF file t2.upf with version 1.0...
set_logic_zero porta
Warning: Constraint 'set_logic_zero' is not supported by dc_shell. (UPF-042)
set_logic_zero portB
Warning: Constraint 'set_logic_zero' is not supported by dc_shell. (UPF-042)
set_logic_one portC
Warning: Constraint 'set_logic_one' is not supported by dc_shell. (UPF-042)

Summary of unsupported constraints:
Information: Ignored 1 unsupported 'set_logic_one' constraint. (UPF-043)
Information: Ignored 2 unsupported 'set_logic_zero' constraints. (UPF-043)

End loading UPF file t2.upf
1
prompt>
```

The following example shows the behavior of **load_upf** when unknown options or syntax errors are encountered in the UPF file:

```
prompt> load_upf 9.upf

Loading UPF file 9.upf with version 1.0...
set_scope A
create_power_domain PD1
create_supply_port o -dir out -domain PD1 -abcd
Error: unknown option '-abcd' (CMD-010)
Error: Errors reading UPF file: . Use error_info for more information. (UPF-044)

End loading UPF file 9.upf
0
```

```
prompt> load_upf 5.upf

Loading UPF file 5.upf with version 1.0...
Error: Errors reading UPF file: EOF found before command was complete.
Use error_info for more info. (UPF-044)
```

```
End loading UPF file 5.upf
0
prompt>
```

Recursion is supported by **load_upf**; however, circular recursion is not supported. The following example shows the behavior of the **load_upf** command when circular recursion is detected:

```
prompt> load_upf 8.upf

Loading UPF file 8.upf with version 1.0...
load_upf 8.upf
Error: Detected circular references to file 8.upf while loading UPF file 8.upf. (UPF-045)

End loading UPF file 8.upf
load_upf 5.upf

Loading UPF file 5.upf with version 1.0...
set_scope A
create_power_domain PD1 -elements {B1 B2}
create_supply_port o -dir out -domain PD1
Error: Name space conflict while trying to create object A/o. (UPF-049)
load_upf 6.upf

Loading UPF file 6.upf with version 1.0...
add_port_state o -state {state_off off}
Error: Value for list 'supply_port_name' must have 1 elements. (CMD-036)
load_upf 7.upf

Loading UPF file 7.upf with version 1.0...
create_supply_port i -dir out -domain PD1
Error: Name space conflict while trying to create object A/i. (UPF-049)
add_port_state i -state {state_1_0 1.0}
Error: Value for list 'supply_port_name' must have 1 elements. (CMD-036)

End loading UPF file 7.upf

End loading UPF file 6.upf

End loading UPF file 5.upf
load_upf 8.upf
Error: Detected circular references to file 8.upf while loading UPF file 8.upf. (UPF-045)

End loading UPF file 8.upf

End loading UPF file 8.upf
1
prompt>
```

The following example illustrates the use of the **-noecho** option:

```
prompt> load_upf 5.upf

Loading UPF file 5.upf with version 1.0...
set_scope A
create_power_domain PD1 -elements {B1 B2}
create_supply_port o -dir out -domain PD1

End loading UPF file 5.upf
1
```

```
prompt> load_upf 5.upf -noecho
```

```
Loading UPF file 5.upf with version 1.0...

End loading UPF file 5.upf
1
prompt>
```

The following example shows the message generated when an invalid scope is specified with **load_upf**:

```
prompt> load_upf 5.upf -scope AM
Error: Could not set the scope to AM. load_upf failed. (UPF-047)

End loading UPF file 5.upf
0
```

SEE ALSO

`save_upf(2)`
`set_scope(2)`

magnet_placement

Performs magnet placement. Pulls standard cells closer to macros and assigns legal locations.

SYNTAX

```
int magnet_placement
[-move_fixed]
[-mark_fixed]
[-move_soft_fixed]
[-mark_soft_fixed]
[-avoid_soft_blockages]
[-stop_by_sequential_cells]
[-exclude_buffers]
[-logical_level level]
[-stop_points object_list]
[-align]
magnet_objects
```

Data Types

<i>level</i>	integer
<i>object_list</i>	collection
<i>magnet_objects</i>	collection

ARGUMENTS

-move_fixed
Specifies that a cell marked fixed can be moved. A warning occurs when a fixed cell is being moved. By default, fixed cells cannot be moved.

-mark_fixed
Specifies that the cells are to be marked fixed after placement. By default, no cells are marked fixed.

-move_soft_fixed
Specifies that a cell marked soft fixed can be moved. A warning occurs when a soft fixed cell is being moved. By default, fixed cells cannot be moved.

-mark_soft_fixed
Specifies that the cells are to be marked fixed after placement. By default, no cells are marked fixed.

-avoid_soft_blockages
Specifies that cells should not be placed over soft blockages. By default, soft blockages will be ignored.

-stop_by_sequential_cells
Specifies that the pulling of cells closer to magnet should stop when a sequential cell is encountered during level(s) traversal. By default, all the cells in the logical level(s) of the **magnet_object** will be pulled.

```

-exclude_buffers
    Specifies not to consider buffers and inverters when calculating the level.
    They will be pulled like normal cells but will be skipped over for level
    determination. By default, buffers and inverters are considered as one level
    of logic.

-logical_level level
    Specifies the number of logical levels to pull. By default, level is 1 (only
    the first level cells are pulled).
    This option is mutually exclusive with -stop_points.

-stop_points object_list
    Specifies to pull only the cells that are on the timing path between the
    magnet_objects and the -stop_points objects. The objects can be list of any
    pin, port or cell object(s).
    This option is mutually exclusive with -logical_level.

-align
    Specifies to place the cells in a horizontal or vertical alignment with
    respect to the pin of the macro.

magnet_objects
    Specifies the objects to become magnets. The objects can be a fixed macro
    cell, a pin of a fixed macro cell, or an I/O pin. Objects like Vias, blockages
    are not allowed to be magnets.

```

DESCRIPTION

The **magnet_placement** command allows you to define a set of objects as magnets and pull the neighboring cells up to a specified logical level closer to the magnet. Specify a large macro with many placeable standard cell neighbors. Magnet placement can be used on this type of a macro to ensure that the standard cells are placed close to the macro, resulting in better timing and congestion.

It is considered best practice to run the **magnet_placement** command before the **create_placement** command, so that sufficient areas are available for magnet placement operation.

If there are a large number of high fanout nets, **magnet_placement** might pull a large number of cells resulting in large run-time. In order to avoid such cases the environment variable **magnet_placement_fanout_limit** could be set to some reasonable value. The default value is 1000.

The effect of magnet placement is not preserved from one invocation to the other. For example if cells A and B are made magnets and there are cells which are connected to both of them through possibly multiple levels. Doing **magnet_placement A** and then **magnet_placement B**, could result in a different result than doing **magnet_placement [get_cells "A B"** together. Doing the two cells together would give correct result.

If **magnet_placement** is invoked after **create_placement**, there could be standard cells already placed. In such a case finding legal locations for all the cells might not be possible. Hence **magnet_placement** will place cells on top of existing cells. It is recommended that the user uses the **-mark_fixed** option to put a restriction on the

cells, so that operations like place_opt or create_placement would not move the cells. The user can then invoke these commands and run legalize_placement to remove the overlaps. This would move standard cells away from the magnet cells. The user might require to remove the fixed restriction on the magnet_cells and then run a second **legalize_placement** to legalize the magnet_cells.

If you do not want cell overlaps, set the **magnet_placement_disable_overlap** variable before running magnet_placement.

With stop_by_sequential_cells option, if you want to sequential cell element to also get pulled towards magnet, set the **icc_magnetpl_stop_after_seq_cellfp variable before running magnet_placement**. By default only the logic before sequential element will get pulled by magnet placement.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example performs magnet placement on the INST_1 cell:

```
prompt> magnet_placement [get_cells "INST_1"]
```

The following example performs magnet placement and marks the moved cells as dont touch placement:

```
prompt> magnet_placement -mark_fixed [get_cells "INST_2"]
```

The following example pulls two levels of cells to INST_2. Buffers (if any) are pulled but skipped over when calculating levels.

```
prompt> magnet_placement -exclude_buffers -logical_level 2 \
[get_cells "INST_2"]
```

SEE ALSO

```
create_placement(2)
legalize_placement(2)
set_cell_location(2)
set_dont_touch_placement(2)
```

man

Displays reference manual pages.

SYNTAX

```
string man
topic
```

Data Types

```
topic      string
```

ARGUMENTS

```
topic
Specifies the subject to display. Available topics include commands,
variables, and error messages
```

DESCRIPTION

The **man** command displays the online manual page for a command, variable, or error message. Users can write man pages for their own Tcl procedures and access them with the **man** command by setting the **sh_user_man_path** variable to an appropriate value. See the man page for **sh_user_man_path** for details.

EXAMPLES

The following command displays manual page for the **echo** command.

```
prompt> man echo
```

The following command displays the manual page for the error message CMD-025.

```
prompt> man CMD-025
```

SEE ALSO

```
help(2)
sh_user_man_path(3)
```

map_isolation_cell

Specifies how to map or remap the isolations and enable level-shifter cells belonging to the specified isolation strategy. This command is supported only in UPF mode.

SYNTAX

```
status map_isolation_cell
isolation_strategy
-domain power_domain
-lib_cells lib_cells
```

Data Types

<i>isolation_strategy</i>	string
<i>power_domain</i>	string
<i>lib_cells</i>	list

ARGUMENTS

<i>isolation_strategy</i>	Specifies the UPF isolation strategy name. The name of the isolation strategy must be unique within the specified power domain.
- <i>domain power_domain</i>	Specifies the name of the power domain name to which this isolation strategy belongs.
- <i>lib_cells lib_cells</i>	Specifies a list of the target library cells to be used for the isolation mapping.

DESCRIPTION

This command defines how the **compile** command performs the mapping of an isolation cell. All isolation cells that match the strategy will be mapped or remapped to one of the cells specified with the **-lib_cells** option. Resizing is done if required; but the choice is limited only to the library cells specified with the **-lib_cells** option.

You can also specify enable level-shifter cells using the **-lib_cell** option. If the isolation cells are later changed to enable level-shifter cells in the technology library, the cells can only be mapped to the one of the enable level-shifter cells specified with this command.

EXAMPLES

In the following example, the isolation cells belonging to the strategy named *isolation_1* can only be mapped to the LIB_HICLAMP0X2 or LIB_HICLAMP0X4 library cells:

```
map_isolation_cell
```

1162

```
prompt> map_isolation_cell isolation_1 -domain PD1 \
           -lib_cells {LIB_HICLAMP0X2, LIB_HICLAMP0X4}
```

SEE ALSO

`set_isolation(2)`
`set_isolation_control(2)`

map_level_shifter_cell

Specifies that the level-shifter cells belonging to the specified strategy can only be mapped to a subset of the library cells. This command is supported only in UPF mode.

SYNTAX

```
status map_level_shifter_cell
level_shifter_strategy
-domain power_domain
-lib_cells lib_cells
```

Data Types

<i>level_shifter_strategy</i>	string
<i>power_domain</i>	string
<i>lib_cells</i>	list

ARGUMENTS

<i>level_shifter_strategy</i>	Specifies the UPF level-shifter strategy name. The level-shifter strategy name must be unique within the specified power domain.
<i>-domain power_domain</i>	Specifies the power domain name to which this level-shifter strategy belongs.
<i>-lib_cells lib_cells</i>	Specifies a list of library cells that can be used to map to the level-shifter cells.

DESCRIPTION

This command defines how the **compile** command maps the level-shifter cells. All level-shifter cells belonging to the specified strategy are mapped to one of the library cells specified in the **-lib_cells** list. This subset is honored during resizing. If a valid solution cannot be reached using only the specified library cells, no level-shifter cells are inserted. For example, if the level shifters specified in the **-lib_cells** option cannot be used to shift between the required voltage levels, the tool does not insert any level-shifter cell.

For mapping the enable level-shifter cells, use the **map_isolation_cell** command.

EXAMPLES

In the following example the level-shifter cells belonging to the strategy named VL_1 can only be mapped to the LIB_LSHIX2 or LIB_LSHIX4 library cells.

```
prompt> map_level_shifter_cell LVL_1 -domain PD1 \
```

```
-lib_cells {LIB_LSHIX2, LIB_LSHIX4}
```

SEE ALSO

```
map_isolation_cell(2)  
set_level_shifter(2)
```

map_power_switch

Defines which power switch library cells to use for the mapping of the given UPF power switch.

SYNTAX

```
status map_power_switch  
switch_name  
-domain domain_name  
-lib_cells list
```

Data Types

switch_name	string
domain_name	string
list	list

ARGUMENTS

switch_name	Specifies the name of the power switch to be mapped using the specified library cells. This is a required option.
-domain domain_name	Specifies the power domain where this power switch was created. This is a required option.
-lib_cells list	Specifies a list of target library cells to use for the power switch cell mapping. This is a required option.

DESCRIPTION

This command is used to explicitly specify which library power switch cells are mapped for the corresponding UPF power switch.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example maps the switch_1A power switch in the power domain named myPowerDomain with the lib2A/switch2A library cell:

```
prompt> map_power_switch switch_1A \  
          -domain myPowerDomain -lib_cells lib2A/switch2A  
1
```

SEE ALSO

`create_power_switch(2)`
`get_physical_lib_cells(2)`

map_retention_cell

Defines how to map the unmapped sequential cells to retention cells for the specified UPF retention strategy of the power domain. This command is supported only in UPF mode.

SYNTAX

```
status map_retention_cell
retention_strategy
-domain power_domain
[-lib_cells lib_cells]
[-lib_cell_type lib_cell_type]
[-elements objects]
```

Data Types

<i>retention_strategy</i>	string
<i>power_domain</i>	string
<i>lib_cells</i>	list
<i>lib_cell_type</i>	string
<i>objects</i>	list

ARGUMENTS

retention_strategy
Specifies the UPF retention strategy name. The retention strategy name should be unique within the specified power domain.

-domain power_domain
Specifies the power domain name that this UPF retention strategy will be applied to.

-lib_cells lib_cells
Specifies a list of target library lib cells to be used for the retention mapping.

-lib_cell_type lib_cell_type
Specifies retention type to be used for the retention mapping.

-elements objects
Specifies the objects that the retention mapping only happens to the sequential cells within the specified objects. The objects can be a list of hierarchical cells, leaf cells, seqgen output signal net.

DESCRIPTION

This command defines how compile does the retention mapping. If **-elements** is not specified, then the mapping applies to all sequential cells that the specified retention strategy applies to.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows an example that maps the sequential cells under retention strategy *retention_1* to CLK_LOW retention type.

```
prompt> map_retention_cell retention_1\  
-domain PD1\  
-lib_cell_type CLK_LOW
```

SEE ALSO

`set_retention(2)`
`set_retention_control(2)`

mark_clock_tree

Marks clock attributes on clock objects.

SYNTAX

```
status mark_clock_tree
[-clock_trees name_or_source_pin_list]
[-clock_synthesized]
[-fix_sinks]
[-clock_net]
[-ideal_net]
[-routing_rule name_of_the_non_default_routing_rule]
[-use_default_routing_for_sinks n]
[-layer_list list_of_layer_names]
[-remove]
```

Data Types

<i>name_or_source_pin_list</i>	list
<i>name_of_the_non_default_routing_rule</i>	string
<i>n</i>	integer
<i>list_of_layer_names</i>	string

ARGUMENTS

-clock_trees *name_or_source_pin_list*

Marks only those clock trees whose names or root pins are listed in *name_or_source_pin_list*. Each element of *name_or_source_pin_list* must be either a clock tree name or a clock root (port or pin) shown in **report_clock**. By default, the command is applied to all currently defined clock trees.

-clock_synthesized

Marks all CTS related objects as synthesized by **compile_clock_tree** command.

-fix_sinks

Cooperates with **-clock_synthesized**, to enable **mark_clock_tree** to mark clock sinks as fixed placement to avoid neither sizing nor moving them.

-clock_net

Marks all clock nets as clock type. Router will identify these clock nets for clock routing. There will be no impact on the cells in the clock tree.

-ideal_net

Marks all clock nets as ideal type. Timer will reset synthesized clock tree back to ideal clock mode. There will be no impact on the cells in the clock tree.

-routing_rule *name_of_the_non_default_routing_rule*

Specifies the nondefault routing rule to be used for clock tree nets.

-use_default_routing_for_sinks *n*

Forces the default routing rule to be used on the leaf nets that drive the

clock tree sinks, and nets at the bottom $n-1$ levels of the clock tree. A net is considered as leaf net if it drives at least one flip-flop or latch. Float pins, exclude pins and dont_touch_subtree pins are treated as non-sink pins of the clock tree for this purpose. For example, a net that drives only one float pin will not be treated as leaf net for this purpose. The default is 0. This option is only active if the **-routing_rule** option is specified.

-layer_list *list_of_layer_names*

Specifies the list of layers that can be used during routing of clock nets. If the list has more than 2 elements, the min and max will be derived by the program.

-remove

Removes the specified attribute. Coordinates with **-clock_synthesized**, **-ideal_net**, **-routing_rule**, or **-layer_list**.

DESCRIPTION

This command marks clock attributes on clock objects and updates the design database with the results of the updated clock trees. The motivation of this command mainly comes from 3 parts. Firstly, synthesized clock trees imported from Astro or third-party cannot be recognized by ICC CTS or post-CTS engine due to lack of sufficient clock attributes. **mark_clock_tree -clock_synthesized** is to enable the capability to add necessary ICC CTS identity information for a clock tree synthesized by third-party. After attribute marking, the clock tree is supposed the same as built by **compile_clock_tree**. This is to smooth the third-party CTS plus ICC post-CTS flow. Secondly, **mark_clock_tree -clock_net** is to enable the capability to mark clock net type in database, which is desired for clock routing consideration. Thirdly, it is strongly required to have the capability to change non-default routing rule settings directly for a synthesized clock tree. This is to adjust the routing parameters to alleviate congestion, while re-compile the clock tree is unacceptable. However, it is a very tedious job to manually perform these NDR settings on thousands of clock nets through **set_net_routing_rule** or **set_net_routing_layer_constraints** commands. Here **mark_clock_tree -routing_rule** and **mark_clock_tree -layer_list** are to enable the NDR modification directly for a whole clock tree. This command should also be run after any post-CTS manual ECO done on clock network to mark clock attributes on newly created cells and nets.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example assumes a clock tree created by third party. Lack of sufficient ICC CTS attributes, it cannot be recognized and **report_clock_tree** is not able to report it. After **mark_clock_tree**, this clock tree can then be reported properly.

```
prompt> mark_clock_tree -clock_trees CLK1 -clock_synthesized
prompt> report_clock_tree -clock_trees CLK1
```

SEE ALSO

mem

Reports memory usage information.

SYNTAX

```
int mem  
[-all]  
[-verbose]
```

ARGUMENTS

-all

Report the maximum of the peak memory usage among the main process and its child processes.

-verbose

Report in detail the peak memory usage of the main process and each child process, including placement, extraction, and routing.

DESCRIPTION

This command reports the peak memory usage of processes. By default, it reports the peak memory usage of the main process in kilobytes. If you specify the **-all** option, it reports the maximum of the peak memory usage among the main process and its child processes. If you specify both the **-all** and **-verbose** options, it also prints out the peak memory usage in megabytes for the main process and each child process.

Memory peak is defined as the memory high-water-mark of processes. When the tool reports a memory peak, it means the maximum memory allocated from the operating system. When child processes exist, the tool reports the maximum number among the main process and its child processes.

Note that the **mem** command reports the peak memory usage, not the swap space usage of the process. It actually reports how much memory was allocated from the operating system at the peak point. Some of the memory can be swapped out by the operating system based on the system status.

EXAMPLES

The following example shows the default command output.

```
prompt> mem  
102400
```

The following example shows the output when using the **-all** and **-verbose** options.

```
prompt> mem -all -verbose  
Main process mem-peak: 100 Mb  
Child "placement" called 3 times, mem-peak: 60 Mb  
Child "extraction" called 3 times, mem-peak: 50 Mb
```

102400

SEE ALSO

`cputime(2)`
`monitor_cpu_memory(3)`

merge_clock_gates

Merges multiple compatible clock gates into one.

SYNTAX

```
status merge_clock_gates
[-verbose]
[-preview]
```

ARGUMENTS

-verbose

Specifies that **merge_clock_gates** should print verbose information about the merges done.

-preview

Specifies that **merge_clock_gates** should do the analysis and just print a preview of what merges are possible. No merging is done.

DESCRIPTION

This command analyzes clock gates at each level of hierarchy in the current design and replaces each set compatible clock gates with a single clock gate. Two clock gates considered compatible if all their input signals are logically equivalent. The merging is not done across hierarchy.

If **-preview** and **-verbose** options are specified together, only -preview is honored and no merging is done.

After merging, the **merge_clock_gates** command does a clean up of the design to remove any unused combinational logic.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example shows how to print information without merging.

```
prompt> merge_clock_gates -preview
```

The following example shows how to print detailed information.

```
prompt> merge_clock_gates -verbose
```

SEE ALSO

merge_clock_gates
1176

merge_flip_chip_nets

Merges the flip-chip nets into one net.

SYNTAX

```
status merge_flip_chip_nets
      -from from_nets
      -to to_net
      [-update_routing]
```

Data Types

<i>from_nets</i>	collection of net
<i>to_net</i>	string

ARGUMENTS

```
-from from_nets
      Specifies a collection of the top-level nets from hierarchical net groups in
      the current design to be merged into one net. The nets must be of one net
      type. The pins, I/O ports, and terminals are disconnected from the nets in
      the collection and are reconnected to the merged net.

-to to_net
      Specifies the destination net name of the merge. You can assign a new net
      name or you can use the name of one of the nets in the collection.

-update_routing
      Specifies to update the owner_net attribute of the net shapes and vias of the
      specified nets in the collection. Use this option if these nets were partially
      routed using the route_flip_chip command.
```

DESCRIPTION

This command merges the flip-chip nets unqualified by the **assign_flip_chip_nets** command into one net. All components are disconnected from the nets in the specified collection and reconnected to the merged net. It is recommended that you use the **-update_routing** option if this command is used after flip-chip redistribution layer routing is performed using the **route_flip_chip** command.

EXAMPLES

The following example merges the VDD_# nets back to VDD.

```
prompt> merge_flip_chip_nets -from {get_nets VDD* -top_net_of_hierarchical_group -
all} -to VDD
-update_routing
1
```

SEE ALSO

merge_flip_chip_nets
1178

merge_fp_hierarchy

Creates a new level of hierarchy.

SYNTAX

```
int merge_fp_hierarchy
[-design_name design_name]
[-new_cell_name cell_name]
[-cells cell_list]
[-wrapper]
[-input_sdc_file input_file_name]
[-output_sdc_file output_file_name]
[-load_back_sdc]
[-no_port_merging]
```

Data Types

<i>design_name</i>	string
<i>cell_name</i>	string
<i>cell_list</i>	list
<i>input_file_name</i>	string
<i>output_file_name</i>	string

ARGUMENTS

-design_name *design_name*

Specifies the name of the design containing the new level of hierarchy. This name must not already exist in the current design.

-new_cell_name *cell_name*

Specifies the name of the new hierarchy level.

-cells *cell_list*

Specifies a list of cells in the current design to merge into a new level of hierarchy. If more than one cell is specified, they must be enclosed in braces { }.

You can specify a collection of cells here. When necessary, you need specify full name here, like "a/b/c", to indicate the cell "c" under the module "b". Note that the below scenarios may cause you encounter "User input data check failed" error:

- A non-existent cell is specified
- The "new_cell_name" has already been used by other cell in the design
- The "design_name" has already been used by other design in the design
- The cells specified don't belong to the same parent.
- The parent of the specified cells is multiple instantiated

By checking your "cell_list" specification, you can pass the "input data check".

-wrapper

Indicates to create the new cell as a wrapper.

A wrapper is used to selectively expose internal connections/dangling pins onto the wrapper interface, so that future change on such internal objects

wouldn't impact the wrapper interface.
Compared to a non-wrapper merging, a wrapper merging would create extra hier port (and hier net when necessary) on the new cell for:
1. original internal dangling hier port that has no outside connection.
2. original internal floating net that has only one port connected
2. original self-connected internal hier ports, e.g. u2/pin1 is directly connected to u2/pin2 that is on the same cell u2.
3. tie high or tie low internal hier port. Each tie high/low hier port would be connected to an hier port on the new cell.
The name of the new hier port would be same with its internal hier port.
Note a mapping file, named "`<wrapper_cell_name>_wrapper_portname.mapping_file`", would be written in the working directory to show the port name change from original cells to the wrapper cell.

-input_sdc_file *input_file_name*
Specifies a sdc file that is to be updated to reflect the netlist change.
Such a sdc file should contain valid sdc commands for current design.

-output_sdc_file *output_file_name*
Specifies the name of the output sdc file into which the updated sdc constraints would be written.
This option should be used with "-input_sdc_file" option.

-load_back_sdc
Indicates that those updated sdc constraints should also be applied on the current design.
This option should be used with "-input_sdc_file" option.

-no_port_merging
This option stops the ports connected by the same interface net being merged during grouping under wrapper mode. This option only takes effect together with -wrapper option.

DESCRIPTION

This command merges any number of cells in the current design into a new cell, creating a new level of hierarchy. At the same time, you can specify the new design name for the new cell, however, remember to make this new design name unique in the current design.

This command can be used in early design planning or prototyping phase in which the designers need to create a physical hierarchy that is compatible with their floorplan structure. This new hierarchy is derived from logical hierarchy in netlist created by front end designers.

Please note the comments below:

This command doesn't automatically update SDC information stored in current design, unless you specify input SDC file and "-load_back_sdc" option. Or you can reapply SDC file later.

Currently this command couldn't merge cells located in different hierarchy level or different hierarchy module. E.g. this command can merge A/B/C and A/B/D into a new

module E whose full hierarchy name is A/B/E; but it couldn't merge A/B/C and A/F/G, or merge A/B and A/F/G together.

This command also removes design constraints stored in the current design, since the merge operation would produce inconsistent with existing design constraints. So you need to reapply design constraints after running this command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example merges two cells into a new design:

```
prompt> merge_fp_hierarchy -cells {u1 u2} \
      -design_name NEW -new_cell_name U
```

This example specifies a collection of cells for the merge command:

```
prompt> merge_fp_hierarchy -cells [get_cells u*] \
      -design_name NEW -new_cell_name U
```

In the following example, the input SDC file is updated according to the netlist change. Note that the netlist change is committed at the same time.

```
prompt> merge_fp_hierarchy -design_name ANALOG_CELLS \
      -new_cell_name new -cells {u1 u2} \
      -input_sdc_file top.sdc -output_sdc_file out_top.sdc
```

The following example first changes the netlist, then updates the input SDC file, at the end applies the updated SDC file on the changed netlist.

```
prompt> merge_fp_hierarchy -design_name ANALOG_CELLS -\
      new_cell_name new -cells {u1 u2} \
      -input_sdc_file top.sdc -output_sdc_file out_top.sdc -load_back_sdc
```

SEE ALSO

`flatten_fp_hierarchy(2)`

merge_net_shapes

Merges a collection of net shapes and returns the collection of net shapes after merge.

SYNTAX

```
collection merge_net_shapes  
shape_collection
```

Data Types

```
shape_collection      list
```

ARGUMENTS

```
shape_collection  
      Specifies net shape names or a collection returned by the get_net_shapes  
      command.
```

DESCRIPTION

This command merges a collection of net shapes in the current design. It returns a collection handle (identifier) of net shapes after merge. If no objects be merged, the returned collection has the same size with the given collection, the objects in collection are the same too.

Please note that only interconnected net shapes which belong to a same net, on a same metal layer, has same width and end type are eligible to merge. Rectangle net shape and non-rectilinear ending segment of path won't be taken care.

For information about collections and the querying of objects, see the collections man page.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The example merges 2 net shapes to 1 net shape.

```
prompt> merge_net_shapes {PATH#91648 HWIRE#91392}  
{"PATH#91648"}
```

SEE ALSO

```
create_net_shape(2)

1182

```
remove_net_shape(2)
```

merge_net_shapes
1183

merge_saif

Reads a list of SAIF files with their corresponding weights, computes the merged toggle rate and static probability, and annotates the switching activity for nets, pins, and ports in the current design. The command then generates a merged output SAIF file.

SYNTAX

```
integer merge_saif

```

Data Types

<i>saif_file_and_weight_list</i>	list
<i>inst_name</i>	string
<i>merged_saif_name</i>	string
<i>ignore_name</i>	string
<i>ig_absolute_name</i>	string
<i>exclude_file_name</i>	string
<i>ex_absolute_file_name</i>	string
<i>unit_value</i>	string
<i>scale_value</i>	integer
<i>khrate_value</i>	float
<i>annotated_instance_name</i>	string

ARGUMENTS

-input_list *saif_file_and_weight_list*

Specifies the name and the corresponding weight of the Switching Activity Interchange Format (SAIF) file list. The *saif_file_and_weight_list* argument is a list of items in the following format:

```
{-input name.saif -weight number}
```

where **-input** and **-weight** are keywords; *name* identifies a specific .saif file, and $0 < number < 100$. For example, in the following statement, the *gate_back_1.saif* and *gate_back_2.saif* files are weighted by 20% and 80%, respectively and the sum of all weights is equal to **100**.

```

prompt> {-input gate_back_1.saif -weight 20 \
           -input gate_back_2.saif -weight 80}

-instance_name inst_name
    Specifies the instance name as it appears in each SAIF file of the current
    design instance to annotate. The command annotates the instance itself and
    all subinstances in the hierarchy of the specified instance.

-output merged_saif_name
    Specifies the name of the output merged SAIF file.

-simple_merge
    Specifies that all SAIF files are to annotate 100% of the nets, ports and
    pins of the current design and that the command is to perform a simple SAIF
    file data merge. You can use the report_saif command to verify that each SAIF
    file annotates 100% of the current design.

-ignore ignore_name
    Specifies the name of an instance for which to ignore switching activity. Use
    this option to ignore switching activity within the hierarchy of that
    instance in each SAIF file. The ignore names are recognized after the -instance_name
    option.

-ignore_absolute ig_absolute_name
    Specifies the name of an instance for which to ignore switching activity, but
    which is not affected by the use of the -instance_name option. The command
    determines whether a net name is under the "ignore hierarchy" before applying
    the -instance_name option is applied.

-exclude exclude_file_name
    Specifies the name of a file that contains a list of names to ignore. Use
    this option to ignore switching activity for instances specified by the
    exclude_file_name argument. The file specified by the exclude_file_name
    argument must contain each "ignore name" on a separate line, without the -exclude
    switch. The ignore names are recognized after the -instance_name
    option is applied.

-exclude_absolute ex_absolute_file_name
    Specifies the name of a file that contains a list of absolute names to be
    ignored but which are not affected by the use of the -instance_name option.

-unit_base unit_value
    Specifies the base synthesis timing unit for all SAIF files. The synthesis
    timing unit is obtained by using the scale_value argument of the -scale option
    to scale this base unit. The valid values for unit_value are ns, us, or ps.
    The default is ns.

-scale scale_value
    Specifies the value of the scaling factor for the base synthesis timing unit
    for all SAIF files. The synthesis timing unit is obtained by using using
    scale_value to scale the base unit The valid values for scale_value are 1,
    10, or 100. The default is 1.

```

-khrate *khrate_value*
 Specifies a default derating factor value to be used for internal problems for all SAIF files. If you do not use the **-khrate** option, the command uses a default derating factor of **0.5**.

-map_names
 Specifies to use the SAIF name mapping mechanism to match objects in the SAIF file with design objects.

-rtl_direct
 Indicates that the SAIF file has been generated from RTL simulation without reading in an RTL forward SAIF file. When using this option, ensure that the SAIF file obtained from simulation has been done on an RTL design and that no RTL forward SAIF files have been used. The following criteria must be met:

- When using the vpower PLI/FLI, the **read_rtl_saif** command has not been performed and the net monitoring has been set to *rtl_on* by using the **set_gate_level_monitoring** command in the programmable language interface (PLI), and the **set_net_monitoring_policy** command in FLI.
- When using the vcd2saif utility, the **-rtl** argument has not been used. For more information about using vpower PLI for Verilog, the power FLI interface for the MTI VHDL simulator, and the vcd2saif application, see the Power Compiler manuals.
 Please note that flows involving forward RTL SAIF files and flows involving the **merge_saif** command with the **-rtl_direct** option will be made obsolete in future releases. Use flows involving the **saif_map** and **merge_saif -map_names** instead.

-strip_module *annotated_instance_name*
 Specifies the instance name to be annotated in the current design. Note that this option is obsolete; use the **-instance** option instead.

DESCRIPTION

The **merge_saif** command reads a list of SAIF files with their corresponding weights, computes the merged toggle rate and static probability, and annotates the switching activity **toggle_rate** and **static_probability** attributes for nets, ports, and pins of the current design. The **merge_saif** command can also generate a merged output SAIF file.

To identify the instance (and corresponding subinstances) to annotate, use the **-instance_name** option. To set the synthesis timing unit, use the **-unit_base** and **-scale** options, unless you are certain that the synthesis timing unit is 1ns. To specify a default derating factor other than 0.5, use the **-khrate** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reads and merges weighted SAIF files, annotates switching activity for the current design, and generates an output SAIF file:

```
prompt> merge_saif -input_list \
{-input gate_back1.saif -weight 10 \
-input gate_back2.saif -weight 20 \
-input gate_back3.saif -weight 30 \
-input gate_back4.saif -weight 40} \
-instance E/UUT -output merged_saif.saif
```

SEE ALSO

move_mw_cel_origin

Moves the origin of a Milkyway design.

SYNTAX

```
status move_mw_cel_origin  
-to point  
[mw_cel_list]
```

Data Types

<i>point</i>	list
<i>mw_cel_list</i>	list

ARGUMENTS

-to *point*
Specifies the new location of the origin. The number is specified in user units which are determined by the technology information.

mw_cel_list
Specifies the Milkyway designs for which to move the origin. You can specify the Milkyway design by name, pattern, or by the mw_cel collection's name. By default, the command uses the current_mw_cel.

DESCRIPTION

This command sets the origin of the Milkyway design to a new location. It changes the coordinates of all physical objects in the Milkyway design.

For example, suppose the die area of the Milkyway design is {{10 10} {100 100}} and you want to make the lower-left point of die area at {0 0}; then you can move the mw_cel origin by specifying the following:

```
move_mw_cel_origin -to {10 10}
```

After the move, the die area is {{0 0} {90 90}} and all coordinates of the physical objects in this Milkyway design are decreased by 10.

If you use this command multiple times in a session, the origin for each subsequent command is based on the previous command, not the original origin that started the session.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example moves the current mw_cel location and sets the lower-left point at {0 0}.

```
prompt> get_attribute [get_die_area] bbox
{{10.000 10.000} {100.000 100.000}}
prompt> move_mw_cel_origin -to {10 10}
Moving cell origin ...
1
prompt> get_attribute [get_die_area] bbox
{{0.000 0.000} {90.000 90.000}}
```

The following example moves a Milkyway design's location by giving the mw_cel collection.

```
prompt> set my_design [get_mw_cels top_design]
prompt> move_mw_cel_origin -to {-10 -10} $my_design
Moving cell origin ...
1
```

SEE ALSO

[get_mw_cels\(2\)](#)

move_objects

Moves one or more objects to the specified location.

SYNTAX

```
status move_objects
[-delta vector]
[-from point]
[-to point]
[-x real]
[-y real]
[-keep_placement]
[-keep_pad_to_core_distance]
[-ignore_fixed]
objects
```

Data Types

objects collection

ARGUMENTS

-delta *vector*
Specifies the displacements for objects to move through. This option cannot be used with -to, -from, -x or -y options. By default, the command uses no displacement.

-from *point*
Specifies the reference point on the object or objects to be moved for the -to option. By default, the command uses the lower-left corner of the bounding box of the given object (or collection of objects) as the reference point. You can use the -from option only if you also specify the -to option.

-to *point*
Specifies the new location of the reference point for the object or objects. This option cannot be used with the -delta, -x or -y options.

-x *real*
Specifies the x coordinate for the given object (or collection of objects). All objects will be moved so that their left edge is at this x coordinate. This option cannot be used with the -delta, -to or -from options.

-y *real*
Specifies the y coordinate for the given object (or collection of objects). All objects will be moved so that their bottom edge is at this y coordinate. This option cannot be used with the -delta, -to or -from options.

-keep_placement
This option is effective only when applied to the core or the die. It will be ignored if applied on any other object.
All objects within the core or the die are moved together with the core or the die. Their relative locations are preserved.

The default is **false**.

-keep_pad_to_core_distance
This option is effective only when applied to the core or the die. It will be ignored if applied on any other object.
This maintains the distance between the core and the pad cells and by implication the distance between the core and the die, thus forcing changes to the core and the die to be made in tandem with each other. If pad cells are absent then the core-to-die distance will still be maintained.
The default is **false**.

-ignore_fixed
Normally fixed objects will not be moved. If this flag is supplied then fixed objects will also be moved.

objects
Specifies the objects to be moved.

DESCRIPTION

This command moves one or more objects to a specified location.

See `get_edit_property(2)` man page for details on which objects can be moved.

NOTES

Fixed objects will not be moved unless `-ignore_fixed` is specified.

Snapping is done automatically using global snap settings.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example moves all the route guides so that the left hand corner of the bounding box of all the route guides is at the coordinate {1400 1600}.

```
prompt> move_objects -to {1400 1600} [get_route_guides *]
```

The following example moves all selected objects so that their left hand edges are at x = 0.

```
prompt> move_objects -x 0 [get_selection]
```

SEE ALSO

expand_objects(2)
flip_objects(2)
set_object_snap_type(2)
get_object_snap_type(2)
undo(2)
redo(2)
```

```
move_objects
1192
```

move_pins_on_edge

Moves a set of pins along the side of a cell or macro.

SYNTAX

```
status move_pins_on_edge
-distance real
[-overlap_policy overlap_policy_type]
[-layer_policy layer_policy_type]
pins
```

Data Types

<i>real</i>	float
<i>overlap_policy_type</i>	string
<i>layer_policy_type</i>	string
<i>pins</i>	collection

ARGUMENTS

-distance real

Specifies the distance to move pins along the edge of a cell or macro.
A positive distance indicates counter clockwise movement; a negative distance indicates clockwise movement.

-overlap_policy overlap_policy_type

Specifies the action the tool is to take if the move would cause pins to overlap.

The valid values of the *overlap_policy_type* argument and their descriptions are the following:

- **ignore** - ignore overlaps
- **warn** - warn the user
- **fail** - output an error message and don't move pins

• **fix** - use remove_fp_pin_overlaps command to fix overlaps

They are mutually exclusive; choose only one.

The default value is **warn**.

-layer_policy layer_policy_type

Specifies the action the tool is to take if the move places pins on new sides that have different preferred layers.

The valid values of the *layer_policy_type* argument and their descriptions are the following:

- **keep** - keep current layer
- **use_preferred** - use preferred layer for new side

They are mutually exclusive; choose only one.

The default value is **use_preferred**.

pins

Specifies the collection of pins to be moved.

They can be top level pins or macro pins, but they must all have the same parent cell or macro.

DESCRIPTION

This command moves a set of pins along the side of a cell or macro.

Note that supplied pins must all belong to the same cell or soft macro.

You can move the pins counter clockwise by using a positive distance or clockwise by using a negative distance.

You can also specify how overlaps are handled and whether layers are changed if the pin is moved to a new side with different preferred layers.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example moves pins **100nm** counter clockwise and fails if it causes overlaps:

```
prompt> set_pins [get_pins -filter "is_hierarchical==true" *clk*]
prompt> move_pins_on_edge -distance 100 -overlap fail $pins
```

SEE ALSO

`remove_fp_pin_overlaps(2)`

mw_cel_collection

Describes the methodology for using mw_cel collection.

DESCRIPTION

How to specify mw_cel by name

A unique mw_cel can be specified by the following:

A[.B[;C]]

Where:

A is the base name of the mw_cel, and the maximum length of A is 1023.

B is the view name of the mw_cel, and the maximum length of B is 31.

C is the version number. The version number starts at 1.

The following characters . (period) and ; (semicolon) are invalid in the base name, view name, or version of an mw_cel name.

The version of an mw_cel name is usually omitted. If the version is not specified, the latest version is assumed unless an individual command has a special interpretation. The lastest version is the version with highest version number.

Because ; is a keyword in Tcl language, if the version is to be specified for an mw_cel, you must use proper quoting, such as double quotation marks, for example:

"top.CEL;1".

If you do not use double quotation marks, the command might appear to succeed, but might produce unexpected results. For example, in the following command:

```
prompt> open_mw_cel test1.CEL;1
Info: Opened "test1.CEL;2" from "/root/data/design" library
[1]
```

1 is considered as a separate command, and the **open_mw_cel** command actually opens the latest version, not version 1.

You can omit the view name. When you do this, you must also omit the version. If you do not specify the view name, the command will assume the CEL view and the latest version unless the individual command has a special interpretation.

Currently supported views

Currently, 5 kind of views are supported: CEL, FRAM, err, FILL and ILM. You can not specify the mw_cel of other views through the command line. However, some commands may have the ability to operate on other views internally.

Display of the mw_cel collection

The display of an mw_cel collection does not contain view and version. For example:

```
prompt> open_mw_cel test1
Info: Opened "test1.CEL;2" from "/root/data/design" library
{test1}
```

To get the view and version information, use the attribute `version` and `view_name`.

```
prompt> get_attribute [current_mw_cel] view_name
CEL
prompt> get_attribute [current_mw_cel] version
2
```

SEE ALSO

```
close_mw_cel(2)
collections(2)
copy_mw_cel(2)
create_mw_cel(2)
current_mw_cel(2)
get_mw_cel(2)
open_mw_cel(2)
remove_mw_cel(2)
rename_mw_cel(2)
save_mw_cel(2)
```

name_format

Specifies the name format for the isolation cells and level shifters.

SYNTAX

```
status name_format
[-isolation_prefix name]
[-isolation_suffix name]
[-level_shift_prefix name]
[-level_shift_suffix name]
```

Data Types

name string

ARGUMENTS

```
-isolation_prefix name
    Specifies the prefix to be used for the isolation cell names. The default is
    "".

-isolation_suffix name
    Specifies the suffix to be used for the isolation cell names. The default is
    "_UPF_ISO".

-level_shift_prefix name
    Specifies the prefix to be used for the level shifter cell names. The default
    is "".

-level_shift_suffix name
    Specifies the suffix to be used for the level shifter cell names. The default
    is "_UPF_LS".
```

DESCRIPTION

This command specifies the suffix and prefix for the isolation and level shifter cells. The name of the element that is being isolated or level shifted by the isolation or the level shifter cell is used in the middle. For example, an isolation cell that isolates a port named p1 will be named p1_UPF_ISO by default.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of the **name_format** command:

```
prompt> name_format -isolation_prefix "MY_ISO" -level_shift_prefix "MY_LS"
```

SEE ALSO

`set_isolation(2)`
`set_level_shifter(2)`

open_mw_cel

Opens a Milkyway design.

SYNTAX

```
collection open_mw_cel
[-readonly]
[-library library]
[-version version]
[-not_as_current]
mw_cel_name
```

Data Types

<i>library</i>	string
<i>version</i>	int
<i>mw_cel_name</i>	list

ARGUMENTS

-readonly
Specifies to open the Milkyway design for reading, but not for writing. You cannot modify and save the Milkyway design.

-library *library*
Specifies the library in which the Milkyway design exists. This option will be ignored if there is an opened Milkyway library.
If you also specified the **-readonly** option, and the *library* you specified was not already opened, the *library* will be opened as read-only. The side effect is that if you want to open another Milkyway design for writing in the same library later, you must first close the *library*, because it will still be open as read-only at that time.
If a library is already open in read-only mode, the Milkyway design is opened in read-only mode, even if it is not explicitly specified.
By default, the command assumes that the specified Milkyway design exists in the current library.

-version *version*
Specifies the version of the Milkyway design to open. A valid value of *version* is an integer value. This option will override the version specification given in the *mw_cel_name* command. For information on how to specify an *mw_cel_name*, see the *mw_cel_collection* man page.

-not_as_current
Specifies to open the Milkyway design in the background (that is, the Milkyway design gets opened but is not made current). The current design stays the same. This option is used only via a GUI command to overlay a different view of the Milkyway design on the current Milkyway design.

mw_cel_name
Specifies the name of the Milkyway design to open.
You can specify the Milkyway design name by using two parts: the name and the

view name. For example, *top.CEL* specifies a Milkyway design named *top* in the *CEL* view. If you give it a simple name, such as *test*, the command assumes you are looking for the Milkyway design name *test.CEL*.

You can give a Milkyway design name list or a Milkyway design collection as the argument. This means you can open several Milkyway designs at the same time. If successful, the last opened Milkyway design is set as the current Milkyway design, and then you can switch the current Milkyway design among them by using the **current_mw_cel** command.

For information on how to specify the *mw_cel_name*, see the *mw_cel_collection* man page.

DESCRIPTION

This command opens a Milkyway design and automatically sets it as the current Milkyway design. If you open a Milkyway design as read-only, you can retrieve only information from it; you are not allowed to change that Milkyway design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example opens one Milkyway design:

```
prompt> open_mw_cel DUT
{ "DUT" }
```

SEE ALSO

```
close_mw_cel(2)
copy_mw_cel(2)
create_mw_cel(2)
current_mw_cel(2)
get_mw_cels(2)
mw_cel_collection(2)
remove_mw_cel(2)
rename_mw_cel(2)
save_mw_cel(2)
```

open_mw_lib

Opens a Milkyway library.

SYNTAX

```
collection open_mw_lib
[-readonly | -write_ref]
mw_lib
```

Data Types

mw_lib string

ARGUMENTS

-readonly

Specifies to open the Milkyway library only for reading. You cannot modify and save the library in this mode.

The **-readonly** and **-write_ref** options are mutually exclusive. The default is to open the main library as read/write and all reference libraries as read only.

-write_ref

Specifies to open the reference library for writing. This option implies that the main library is opened for writing.

The **-readonly** and **-write-ref** options are mutually exclusive. The default is to open the main library as read/write and all reference libraries as read only.

mw_lib

Specifies to open the Milkyway library.

DESCRIPTION

This command opens a Milkyway library. The two access permissions for an opened library are read only or read/write. Specifying the write permission implies that read permission is granted. If you specify the **-readonly** option, the command opens the main library and all reference libraries as read only. If you specify the **-write_ref** option, it opens the main library and all reference libraries as read/write.

If you open the library as read only, you can read from the library but you cannot write to it.

Specifically, opening the Milkyway cel to write in it is not permitted. If you open the library as read/write, you can modify it.

The opened Milkyway library is automatically set to be the current Milkyway library.

You cannot open more than one main library at the same time. To open another main library, you must first close the previous main library.

This command returns a collection of Milkyway libraries if it succeeds.

See the man pages for the **set_mw_lib_reference** and **set_mw_technology_file** commands for information on setting or changing reference libraries and technology files.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example opens a Milkyway library named *access05* for writing in the current session:

```
prompt> open_mw_lib access05
{"access05"}
```

SEE ALSO

```

optimize_clock_tree

Performs clock tree optimization.

SYNTAX

```
status optimize_clock_tree
[-clock_trees clock_trees]
[-buffer_relocation]
[-buffer_sizing]
[-gate_relocation]
[-gate_sizing]
[-delay_insertion]
[-operating_condition min | max | min_max]
[-premesh]
[-postmesh]
[-mesh_net mesh_net_name]
[-routed_clock_stage none | global | track | detail | detail_with_signal_routes]
[-search_repair_loop loop_number]
[-no_clock_eco_route]
```

Data Types

<i>clock_trees</i>	collection
<i>mesh_net_name</i>	string
<i>loop_number</i>	integer

ARGUMENTS

```
-clock_trees clock_trees
    Specifies the clock name or a collection of clock objects to optimize.

-buffer_relocation
    Enables buffer relocation.

-buffer_sizing
    Enables buffer sizing.

-gate_relocation
    Enables gate relocation.

-gate_sizing
    Enables gate sizing. Gate sizing performs sizing on clock gates and buffers
    in the clock tree to improve insertion delay and skew.

-delay_insertion
    Enables delay insertion.

-operating_condition min | max | min_max
    Specifies the operating_condition to use. The default is max.

-premesh
    Runs optimization on the premesh part of the clock tree from the root of the
```

clock tree to the mesh net.

-postmesh
Runs optimization on low-latency branches that are driven by clock mesh to reduce skew.

-mesh_net mesh_net_name
Specifies the name of the clock mesh net.

-routed_clock_stage none | global | track | detail | detail_with_signal_routes
Specifies the current routing stage for the design before optimize_clock_tree. **None** is for pre-route optimization. Otherwise, the tool performs post-route optimization and the value controls the eco clock route stage. **Global** is for clock net only global route. By default, Integrated Clock **Global** Router is employed by optimize_clock_tree to perform the global routing. Therefore, -routed_clock_stage global is redundant and will be ignored unless Integrated Clock **Global** Router is turned off. **Detail** is for clock net only detail route while detail_with_signal_routes is route both clock and signal nets. By default, the routed clock stage is **none**.

-search_repair_loop loop_number
Specifies the clock detail route search and repair loop. By default, the loop number is **2**.

-no_clock_eco_route
Specifies for the post-route optimize_clock_tree to skip clock eco routing and extraction. By default, the post-route clock tree optimization performs clock routing based on the post-route stage and does extraction.

DESCRIPTION

This command performs clock tree optimization to improve the skew and insertion delay of the clock tree. You can specify the optimization techniques to use by choosing from the following options: **-buffer_relocation**, **-buffer_sizing**, **-gate_relocation**, **-gate_sizing**, and **-delay_insertion**. If you do not specify any optimization techniques, the tool performs all of them.

You can also execute this command when all clocks have been routed or when all clock and signals have been routed. In either of these cases, only buffer and gate sizing options are allowed. In the post-route situation, eco routing on clock nets and extraction are executed after the optimization stage is completed based on setting the **-routed_clock_stage** option and not setting the **-no_clock_eco_route** option. The **-search_repair_loop** option specifies to the detail router the number of loops used in search and repair.

In a mesh flow, the **split_clock_net** command automatically creates clusters with reasonable balance and estimated latency. However, mesh clock trees might not be completely optimized because of the tight timing constraints imposed by mesh designs. Branches that are driven by a mesh with poor skew might impact the overall clock skew. Therefore, use the **-postmesh** when you specify **-mesh_net** to optimize the branches of a mesh clock tree, where the mesh net should be the high fanout net of the clock tree. The command models the mesh as ideal and restructures the branches by resizing, splitting up into two sections, and displacing the buffers of the branches to increase latency.

`Optimize_clock_tree` is capable of balancing skew in multiple process corners. The `multicorner` option is activated with the `set_clock_tree_optimization_options` command. Please refer to that manual page for details.

EXAMPLES

The following example performs clock tree optimization by using the buffer sizing and buffer relocation options.

```
prompt> optimize_clock_tree -buffer_sizing -buffer_relocation
```

The following example performs clock tree optimization for the clock tree named `Clk`, using only the delay insertion option.

```
prompt> optimize_clock_tree -clock_tree Clk -delay_insertion
```

The following example performs post-route clock tree optimization at the clock net only detail route stage:

```
prompt> optimize_clock_tree -routed_clock_stage detail
```

SEE ALSO

`compile_clock_tree(2)`

`set_clock_tree_optimization_options(2)`

optimize_dft

Performs placement-aware or clock-aware scan reordering.

SYNTAX

```
status optimize_dft
[-clock_buffer]
[-plan_group]
```

ARGUMENTS

-clock_buffer

Invokes clock buffer-aware scan reordering, which aims to minimize the number of clock buffer crossings in the scan chain for better hold violation reduction along scan path.

-plan_group

The option is designed for Design Planning to enable plan group aware scan chain repartition and reordering after plan groups are defined. It will optimize the design to minimize top-level scan wires, scan ports on the blocks and scan net feedthroughs. This option is expected to be used prior to global routing and pin assignment.

DESCRIPTION

The **optimize_dft** performs scan chain reordering. By default it performs placement aware scan reordering. It aims to reduce the scan chain wire-length, minimize congestion and improve routability. Prior to using this option you must first use either the **read_def** command or **trace_scan_chain** command to read in scan chain information of the design, and have performed placement on the design.

When invoked with the **-clock_buffer** option, **optimize_dft** performs clock buffer-aware scan reordering. The reordering aims to minimize the number of buffer crossings in the scan chain. Minimizing the number of buffer crossings can reduce hold time violations in the scan chain. For best results you should first perform placement aware scan reordering.

For best results we recommend to use **place_opt -optimize_dft** option and **clock_opt -optimize_dft** commands instead of **optimize_dft** command. The **optimize_dft** command is provided for advanced users who want to have finer control over the placement and clock tree synthesis processes.

The standalone **optimize_dft** command does not update extraction or timing data so the user must do that. For example, use **psynopt** after **optimize_dft**.

Moreover, before performing any optimization, we strongly recommend to perform the **check_scan_chain** command since only "VALIDATED"V scan chains will be optimized with the **optimize_dft** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

```

optimize_flip_chip_route

Beautifies the flip-chip routing patterns.

SYNTAX

```
status optimize_flip_chip_route
[-nets collection_of_nets
 | -nets_in_file nets_file]
[-layer tech_layer_number | layer_name]
[-change_route_type user_enter | signal_route]
```

Data Types

nets_file string

DATA TYPES

```
tech_layer_number integer
mX      string
MX      string
nets_file   string
layer_name   string
```

ARGUMENTS

-nets collection_of_nets

Specifies the nets to be optimized. By default, all flip-chip nets are optimize.

This option and the **-nets_in_file** option are mutually exclusive.

-nets_in_file nets_file

Specifies the name of a file that contains the list of nets to be optimized. This option and the **-nets** option are mutually exclusive.

-layer tech_layer_number | layer_name

Specifies the metal layer on which to optimize the flip-chip wires. You specify the metal layer by using its metal number or technology file layer number.

This option must be set.

-change_route_type user_enter | signal_route

Change all existing flip-chip wires, paths and vias route type to "user_enter" or "signal_route".

DESCRIPTION

This command beautifies the flip-chip routing patterns by doing L-shape and Z-shape optimization on the flip-chip wires.

EXAMPLES

The following example optimizes the flip-chip routing patterns on the top metal layer.

```
prompt> optimize_flip_chip_route
```

The following example changes the flip-chip routing route-type to user_enter.

```
prompt> optimize_flip_chip_route -change_route_type user_enter
```

optimize_fp_timing

Performs timing optimization on the design.

SYNTAX

```
status optimize_fp_timing
[-effort medium | high]
[-fix_design_rule]
[-area_recovery]
[-report_qor]
[-feedthrough_buffering_only]
```

ARGUMENTS

```
-effort medium | high
    Specifies how hard this command should attempt to optimize the design.
    Default effort is medium. Higher the effort, more number of tricks and more
    number of iterations will be performed on the design. Hence higher effort
    will result in higher CPU time. By default, the effort is medium.

-fix_design_rule
    Enables design rule violations fixing. By default, design rule fixing is not
    enabled.

-area_recovery
    Enables area recovery for the cells not on the timing critical paths. By
    default, area recovery is not enabled.

-report_qor
    Report wns and tns of the design. Report utilizations of each plan group and
    top level. Report number of buffer added and number of cell sized for each
    plan group and top level. By default, report qor is off.

-feedthrough_buffering_only
    Only add buffers for feedthrough nets. Do not perform optimization or update
    timing. This option minimizes design changes at the late stage of design
    planning. You must run analyze_fp_routing before using this option;
    Otherwise, the tool issues an error message and stops. By default, this option
    is off.
```

DESCRIPTION

The **optimize_fp_timing** command performs timing optimization on the design. The output of this command is a legally placed netlist. This command is plan group aware.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example optimizes the design timing and fix design rule violation.

```
prompt> optimize_fp_timing -fix_design_rule
```

The following example optimizes the design timing and reports the plan group related QOR after optimization.

```
prompt> optimize_fp_timing -report_qor
```

SEE ALSO

`psynopt(2)`
`analyze_fp_routing(2)`

optimize_netlist_hierarchy

Modifies the net-list tree structure contained in the input net-list in order to create physically partition-able hierarchy nodes in the top level such that the size of the nodes are relatively well-balanced while minimizing the number of top level nets that need to connect to hierarchy block interface.

SYNTAX

```
status optimize_netlist_hierarchy
-netlist_files filelist
-top topName
[-opaque_modules modulelist]
[-max_partition_to_chip_ratio sizeRatio]
[-keep_top_hier modulelist]
[-hier_marker symbol]
[-max_hier_mod_depth Level]
[-max_num_nodes Count]
[-size_metric {simple | instcnt | area}]
[-filename string]
```

Data Types

<i>filelist</i>	Tcl list
<i>topName</i>	String
<i>modulelist</i>	Tcl list
<i>sizeRatio</i>	float (>0)
<i>symbol</i>	Char
<i>Level</i>	integer (>0)
<i>Count</i>	integer (>0)

ARGUMENTS

```
-netlist_files filelist
    Specify list of Verilog design filenames for input. List should follow
    standard Tcl list format.

-top topName
    Specify the module name that should be treated as top module.

[-opaque_modules modulelist]
    Specify list of module names whose instances should retain (as given in input
    Verilog) their lower levels of hierarchy (all the way down to leaf cells).
    Default value is {none}.

[-max_partition_to_chip_ratio sizeRatio]
    This must be a positive floating value. The largest hierarchical node created
    will be smaller than (sizeRatio * total chip size). Size metric used is
    dependent on -size_metric option value. This ratio has an impact on number
    of new top level hierarchical nodes created. If the value specified is larger
    than 1, then no new hierarchy nodes are created. The output Verilog will
    contain top module which is completely flattened (except for the instances
    of cells specified in opaque module list constraint). While the actual number
```

of new hierarchical nodes created for a given sizeRatio can vary depending on the original hierarchy, a generally reliable way to estimate (when sizeRatio is between 0 and 1) is: number of new hierarchical nodes = $((4/3)*(1/\text{sizeRatio}) + 0.5)$, rounded to nearest integer.

`[-keep_top_hier modulelist]`

Specify list of module names whose instances in the design must be fixed in the top hierarchy, irrespective of their original hierarchy in the input Verilog. This is useful for example, to pull the I/O pad cells to the top so that floor-planning tools can work correctly.

`[-hier_marker symbol]`

By default, when hierarchical nodes are flattened, the names are encoded with original full hierarchy using "/" character. However, if the use of "/" character is not suitable in certain flows, users can optional specify any different character. No check is made if this optional specified character is indeed an unused character in the input Verilog. So users need to take care in using appropriate characters. If the hier_marker is a character that is already used in input Verilog, this command is likely to abort when writing output Verilog file.

`[-max_hier_mod_depth Level]`

The command modifies hierarchy from root down to this depth level. Levels of hierarchy deeper than this depth are preserved as in the original net-list.

`[-max_num_nodes Count]`

The value of count specified is in thousands. The command will load the net-list and internally break it into small units called "nodes". By setting a limit on the number of nodes, the command will automatically determine how to map the entire design into specified number of maximum nodes. The command will use only fewer or at most equal to specified number of nodes. From user perspective, controlling this number impacts how much memory the command uses. When memory is limited and design is big, this threshold should be lowered so that the command can execute. In general, the higher the threshold, the greater the quality of partitions but also uses more memory and run time and will modify hierarchy more extensively.

`[-size_metric {simple | instcnt | area}]`

The command uses this flag to know how to measure the partition sizes. Both "simple" and "instcnt" metrics refer to counting of leaf nodes while measuring the hierarchy node sizes. When using "simple" metric all opaque_modules are treated as a single standard cell where as in "instcnt" metric, opaque modules with 100 standard cells is treated as 100 times larger than a single standard cell. "Area" metric refers to measuring a hierarchy node by the area it will need to place all the leaf cells it contains. This is better when there are large sized hard macros in the design. By default, the "instcnt" metric is used.

DESCRIPTION

The gate-level netlist hierarchy structure in an input design (i.e Verilog file) can be considered to be a tree-type structure with top module as the root of the tree and leaf nodes of the tree as standard cells, hard macros (including I/O) or black-boxes. In order to create design convergence friendly physical partitions, it is

necessary to identify candidate hierarchy nodes in the tree that can be converted into well balanced physical partitions with least possible number of inter-partition nets (i.e minimize net cut cost). Quite often the logical hierarchy tree is not well balanced tree. This leads to poor quality physical partitioning resulting in overall hierarchical chip design QoR and run time degradation. In such cases, this command can be used to modify the incoming hierarchy structure into a more balanced, physical partitioning friendly hierarchy structure. The flat-level netlist in the output is guaranteed to be equivalent to the input design.

The command operates on input design (see option `-netlist_files`) specified in Verilog format file(s). The command can, optionally, preserve some part of the original hierarchy (see option `-opaque_modules`). So the output netlist will contain two components - one with modified hierarchy structure and another with preserved hierarchy. Thus the output is separated into three Text files. The first file is a Verilog format file (see option `-output`) that constraints the modified hierarchy component of the design. The second file (written into run directory as `opaque_modules.v`) contains the preserved hierarchy component of the design. The command skips writing `opaque_modules.v` file if it is empty but otherwise will create (or overwrite if pre-existing) `opaque_modules.v`. The third file (written into run directory as `partition_cmds.tcl`) contains the sequence of ungroup/group operations that were applied during the command. The third file provides an alternate way to generate the netlist contained in the other two output files. But using this to generate the netlist is inefficient since the other two output files already contain the resultant netlist. This file is primarily intended for generating new timing constraints file (SDC) given the original timing constraints file which may not work with the hierarchy modified netlist. Before sourcing this script in IC Compiler or DC compiler, users need to define Tcl procedures for grouping and ungrouping operations. See comments section in the file for further instructions and examples. Please refer to user guide on how to convert SDC files to make them work with hierarchy optimized netlist.

The qualitative aspects of the command functionality is briefly described here. The number of *physical partitioning-ready* hierarchy nodes created in the top level is implicitly defined by the constraint user gives on the maximum size of a partition (see option `-max_partition_to_chip_ratio`). The size itself could refer to leaf instance count or area (see option `-size_metric`). As described earlier, the option `-opaque_modules` allows user to give a list of module reference names whose instances will preserve their lower level hierarchy. This is a great way to control the command if the number of opaque modules are small and easily determinable by user. Users can, besides manually listing `opaque_modules`, also use the command's ability to auto-identify `opaque_modules`. For the command to auto-identify the appropriate `opaque_modules`, the command needs some user guidance (see options `-max_hier_mod_depth` and `-max_num_nodes`). Consider a case where the hierarchy must be preserved on all nodes at hierarchy level 3 or deeper. It is a bit cumbersome to open a hierarchy browser and manually collect all the reference names at hierarchy level 3 and mark them as `-opaque_modules`. The users could simply achieve the same by setting `-max_hier_mod_depth` to 3. The other use of `opaque_modules` is related to memory consumption in the command. The option `-max_num_nodes` implicitly puts a limit on maximum memory the command tries to consume. The command does so, by intelligently identifying a list of `opaque_modules`. But its illegal (will result in error message) to combine incompatible options (`-opaque_list`, `-max_hier_mod_depth`, and `-max_num_nodes`) in the same call. It is important to recognize that the instances of `opaque_modules` may be put into different hierarchy than the original (only their lower levels of hierarchy is preserved). Finally, users can also specify if in the final output certain master cell's instances should always be placed in

the top hierarchy (see option `-keep_top_hier`) irrespective of their original hierarchy level in the input. Such cell instances will not be pushed into any hierarchy node the command creates at the top level. One application of this option may be to relocate embedded I/O pad cells to the top.

Please note following limitations. In input Verilog file, bus names should be a valid net name plus a suffix of the form "[%d]" to indicate the bus-bit index and non-busses should not have the "[" and "]" characters in the name (for example, `abc[23]1` is not supported net name). If a bus port is declared as split-bus port in the reference design, then in the instance pin-map the split-bus port must be listed in sequence (i.e MSB to LSB). If they are listed out-of-sequence, the output Verilog files may be incorrect netlist (i.e design is different from the input) and may also trigger link/bind errors when loading in IC compiler.

EXAMPLES

The following example shows how to generate an hierarchy optimized netlist files {`output.v`, `opaque_modules.v`} given `input.v`. `partition_cmds.tcl` is output in the run directory as well.

```
prompt> optimize_netlist_hierarchy -netlist_files input.v -top MYTOP -  
max_partition_to_chip_ratio 0.3 -keep_top_hier {PDB08DGZ PDIANA2PC PDIDGZ} -  
max_num_nodes 500 -size_metric area -output nlout.v
```

SEE ALSO

optimize_power_switch

Optimizes IR drop by sizing header and footer cells up or down.

SYNTAX

```
status optimize_power_switch
-real_pg_net real_pg_net_name
-virtual_pg_net virtual_pg_net_name
[-lib_cell lib_cells_or_power_switches]
[-cells instances]
[-legalize_placement]
[-remove_preroute]
[-preroute_mode_real_pg_port rail | tie | net]
[-no_preroute_real_pg_port]
```

Data Types

<i>real_pg_net_name</i>	collection
<i>virtual_pg_net_name</i>	collection
<i>lib_cells_or_power_switches</i>	collection
<i>instances</i>	collection

ARGUMENTS

-real_pg_net *real_pg_net_name*

Specifies a real power or ground net to perform power network analysis. Real power nets connect to the real power pins of the MTMOS cells. The real power net is not powered down. The *real_pg_net_name* argument can be a collection or list of one item.

-virtual_pg_net *virtual_pg_net_name*

Specifies a virtual power or ground net on which to perform IR drop analysis. Virtual power nets connect to the virtual power pins of the MTMOS cells. The virtual power net can be powered down by the MTMOS header or footer cells to reduce leakage power. The *virtual_pg_net_name* argument can be a collection or list of one item.

-lib_cell *lib_cells_or_power_switches*

Specifies the header or footer multithreshold CMOS (MTMOS) lib cells to use for optimization. Use power switches for Unified Power Format (UPF) mode, and use lib cells for non-UPF mode. The *lib_cells_or_power_switches* argument can be a collection or list. By default, the command gets all the header and footer lib cells of the current design, whose power and ground type is the same as that of the real power and ground net.

-cells *instances*

Specifies the header and footer cells to be optimized. The *instances* argument can be a collection or list. By default, the command gets all header and footer cells that are connected to the real power and ground net and virtual power and ground net.

```

-legalize_placement
    Legalizes cell placement after each sizing loop.

-remove_preroute
    Removes the standard cell connection user via type of preroute after each
    sizing.

-preroute_mode_real_pg_port rail | tie | net
    Specifies the preroute mode for the real power and ground port of MTCMOS cells
    to pass to preroute_standard_cells. The default is rail.

-no_preroute_real_pg_port
    Skips the preroute real power and ground port of MTCMOS cells.

```

DESCRIPTION

This command optimizes the target IR drop by sizing up or down the MTCMOS header and footer cells in the design. The command attempts to size up cells in the neighborhood that exceeds the IR drop target. It sizes down cells in the neighborhood where the IR drop is much less than the specified target.

Prerequisites

Before executing this command, you must perform the following tasks, in order, that are necessary for the Power Network Analysis (PNA) engine to compute the IR drop.

1. Use the **set_attribute** command to set the "mtcmos_resistance" attribute to define power-on resistance of the header or footer cell.
2. Use the **set_attribute** command to set the "mtcmos_pin_layers" attribute to specify the metal layer of the power pins.
3. Use the **create_fp_virtual_pad** command to define the power pad or virtual power pad.
4. Use the **set_mtcmos_pna_strategy** command to define the target IR drop.
5. Use the **derive_pg_connection** command, if necessary, to ensure that the virtual and real power and ground nets of all standard cells have been properly connected logically in the netlist. A standard cell to be powered down should connect to a virtual power and ground net. A standard cell that always stays on should be connected to a real power and ground net.
6. Use the **set_mtcmos_pna_strategy** command to define the PNA-related option.

EXAMPLES

The following example optimizes the IR drop of the design by sizing the MTCMOS header and footer cells. The IR drop target is 150mV. The power nets to be analyzed are VIRTUAL_VDD and VDD.

```

prompt> set_mtcmos_pna_strategy -target_voltage_drop 150
1
prompt> optimize_power_switch -virtual_pg_net VIRTUAL_VDD\
-real_pg_net VDD
1

optimize_pre_cts_power

Performs power optimization before the clock tree synthesis stage.

SYNTAX

```
status optimize_pre_cts_power
[-operating_condition min | max(default) | min_max]
[-update_clock_latency]
```

ARGUMENTS

-operating_condition [min | max(default) | min_max]
Instructs the clock tree synthesis engine to use the specified operating condition.

-update_clock_latency
Instructs to invoke **update_clock_latency** before running power optimization.

DESCRIPTION

The command enables you to perform power optimization that includes power aware placement and clock gating optimization before clock tree synthesis (CTS) stage. This command only performs pre-CTS power optimization, thus no clock trees are seen at the completion of **optimize_pre_cts_power**. However, this command internally utilizes the CTS engine for clock tree estimations. Any ideal clock latency and/or clock uncertainty, specified on pins in the clock structure, are removed by the under-the-hood CTS engine. At the end of this command but before the actual CTS stage, if you need to report the timing based on the previously imposed ideal clock latency and clock uncertainty, reload them manually.

The **set_power_options** command is used to control the behavior of the pre-CTS power optimization by enabling or disabling options such as **-low_power_placement** and **-clock_gating**. When **-low_power_placement** is enabled, switching activity based on power-aware placement is utilized in an incremental way. For the maximum power optimization performance from the power-aware placement, you should specify the same coarse placement settings that are used during **place_opt** or include the settings in the **psyn_constraint_file** before running this command. The detailed options for ICG optimization strategy can be specified by using the **set_optimize_pre_cts_power_options** command.

If you specify **-psyn_constraint_file**, **-cts_constraint_file**, or both with the **set_optimize_pre_cts_power_options** command, the options will be sourced for physical synthesis and internal clock tree synthesis steps during the **optimize_pre_cts_power** command. Note that the constraints defined in either Tcl files will be persistent in the design, so they can affect future operations on the design. Ensure that the constraints for CTS are applied before running any actual CTS commands.

If **-update_clock_latency** is turned on, the **update_clock_latency** will be called before the **psynopt** command.

All the options for **optimize_pre_cts_power** are reported by the

`report_optimize_pre_cts_power_options` command.

Multicorner-Multimode Support

This command uses information from the clock tree synthesis scenario, as well as the active scenarios.

EXAMPLES

The following example shows how to invoke pre-CTS power optimization before CTS.

```
prompt> set_power_options -low_power_placement TRUE -clock_gating TRUE
prompt> set_optimize_pre_cts_power_options -honor_dont_touch
prompt> optimize_pre_cts_power
prompt> compile_clock_tree
```

SEE ALSO

```
set_power_options(2)
set_optimize_pre_cts_power_options(2)
report_optimize_pre_cts_power_options(2)
compile_clock_tree(2)
clock_opt(2)
```

optimize_wire_via

Optimizes the routing to minimize wire length.

SYNTAX

```
status optimize_wire_via
[-nets collection_of_nets]
[-exclude_nets collection_of_nets]
[-search_repair_loop num]
[-run_time_limit num]
[-num_cpus num]
```

Data Types

<i>num</i>	integer
------------	---------

ARGUMENTS

-nets *collection_of_nets*

Specifies the nets that will be optimized. The **-nets** and **-exclude_nets** options are mutually exclusive. If you do not specify either option, all nets are optimized.

-exclude_nets *collection_of_nets*

Specifies the nets that will not be optimized. The **-nets** and **-exclude_nets** options are mutually exclusive. If you do not specify either option, all nets are optimized.

-search_repair_loop *num*

Specifies the number of search and repair loops to be run. The default value is 50. Range is 0 to 1000.

-run_time_limit *num*

Specifies the cpu runtime limit in minutes. Default is no limit (-1). Range is -1 to 500.

-num_cpus *num*

Specifies the number of CPUs for distributed routing. Number must be >= 1. The default value is 1. Range is 0 to 500.

DESCRIPTION

This command invokes route optimization. It will optimize the routing to minimize wire length for all signal nets and clock nets.

Some options are set by using the **set_route_options command**. Please see the **set_route_options documentation**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> optimize_wire_via -search_repair_loop 3  
1
```

SEE ALSO

`set_route_options(2)`

order_rp_groups

Orders the relative placement groups created by the **extract_rp_group** command in a sequential manner.

SYNTAX

```
int order_rp_groups
    -group_name group_name
    [-output file_name]
    [-append]
    [-nosplit]
    [-apply]
    rp_groups
```

Data Types

<i>group_name</i>	string
<i>file_name</i>	string
<i>rp_groups</i>	list or collection

ARGUMENTS

-group_name *group_name*
Specifies a name for the relative placement group. Each relative placement group in the design must have a unique name.

-output *file_name*
Specifies the name of the output file to write the constraints to. If you do not specify this option, the constraints are written to the screen.

-append
Specifies that the constraints should be appended to the file specified in the -output option. By default, if the specified file exists, it is overwritten.

-nosplit
Specifies that the tool should not split the lines when writing out the relative placement constraints.

-apply
Specifies that the relative placement constraints generated by the **order_rp_groups** command are applied to the design. By default, the constraints are written out, but are not applied to the design.

rp_groups
Specifies a list of existing relative placement groups to include in the created group. These groups are added to the new group in the order in which they are specified.

DESCRIPTION

The **order_rp_groups** creates a hierarchical relative placement group that contains the specified groups in the order in which they are specified.

The command returns 1 if the group was created successfully, 0 otherwise.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples show the creation of relative placement groups using the forder_rp_groups command.

```
prompt> order_rp_group -
group_name group0 {top::misc0 top::misc1 top::misc2 top::misc3 top::misc4
top::misc5 top::misc6 top::misc9 top::misc03 top::misc04 top::misc05 top::
misc06 top::misc07 top::misc08} -apply
1
prompt> order_rp_group -
group_name group0 {top::misc0 top::misc1 top::misc2 top::misc3 top::misc4
top::misc5 top::misc6 top::misc9 top::misc03 top::misc04 top::misc05 top::
misc06 top::misc07 top::misc08} -output order.rp -append
1
```

SEE ALSO

[extract_rp_group\(2\)](#)

pack_fp_macro_in_area

Automatically packs macros in the specified area.

SYNTAX

```
status pack_fp_macro_in_area
[-preferred_edges edge_string]
[-objects collection]
[-area list_of_points]
```

Data Types

<i>edge_string</i>	string
<i>collection</i>	collection
<i>list_of_points</i>	list

ARGUMENTS

-preferred_edges *edge_string*

edge_string can be any combination of l (for left), r (right), t (top) and b (bottom). If set, the command will prefer the edges listed in *edge_string*. For example, if *edge_string* is "tlb", the macros will be placed in a "C" shape. Note that specifying no edges is not the same as specifying all edges. For example, if all macros are being pulled toward the bottom by wire length considerations, if no edge is specified, macros will end up in several layers along the bottom edge; if all edges are specified, they will fill up all the edges, thus producing an "O" shape. By default (if the option is omitted), no edges are specified.

-objects *collection*

The behavior depends on the collection.

If the collection is empty (or the option is not supplied) plan group macros will be packed inside the corresponding plan group boundaries; top level macros will be packed in the remaining area. If a plan group boundary is outside core, macros belonging to that plan group will be ignored. Note that if there are no plan groups, all macros will be packed in the core area. If the collection consists of plan groups, macros belonging to those plan groups will be packed inside the plan group boundaries. Top level macros and macros belonging to other plan groups (i.e. plan groups not in the collection) will be ignored.

If the collection consists of macros, the macros in the collection will be packed in the rectangle/polygon determined by the -area option.

-area *list_of_points*

Specifies a polygon/rectangle that is the boundary of the area to pack in. If only two points are specified, they are assumed to be lower left and upper right of a rectangle; else the list of points is assumed to be the list of points in a polygon.

If this option is not specified, the command will use the core boundary.

EXAMPLES

The following example will pack macros belonging to plan group named group1 inside its boundary.

```
prompt> pack_fp_macro_in_area -objects "group1"
```

The following example will pack selected macros in the rectangle with lower left in {450 450} and upper right in {1500 1500}.

```
prompt> pack_fp_macro_in_area -objects [get_selection] \
-area {{450 450} {1500 1500}}
```

The following example will pack macro named macro1 in the polygon determined by the list of points following the -area argument.

```
prompt> pack_fp_macro_in_area -objects [get_cells "macro1"] \
-area {{450 450} {2000 450} {2000 1000} {1200 1000} {1200 2200} {450 2200}}
```

DESCRIPTION

Automatically pack macros along edges of the chosen area.

place_flip_chip_array

Creates flip-chip bumps and places them in a two-dimensional matrix configuration.

SYNTAX

```
status place_flip_chip_array
-physical_lib_cell {phy_lib_cels}
-prefix prefix
-start_point start_point
-number num_bump
-delta {x y}
-repeat {i j}
[-orientation N | W | S | E | FN | FE | FS | FW]
[-cell_origin lower_left | center]
```

Data Types

<i>phy_lib_cels</i>	collection
<i>prefix</i>	string
<i>start_point</i>	point
<i>num_bump</i>	integer
<i>x</i>	distance
<i>y</i>	distance
<i>i</i>	integer
<i>j</i>	integer

ARGUMENTS

```
-physical_lib_cell {phy_lib_cels}
    Specifies a collection of physical library reference cells. The collection
    must contain only one reference cell of the flip chip bump cells to be placed.

-prefix prefix
    Specifies a string prefix to be used when naming bump cells.

-start_point start_point
    Specifies the lower-left X- and Y-coordinates of the array.

-number num_bump
    Specifies the number of flip chip bump instances to create and place. The
    num_bump must be greater than 0.

-delta {x y}
    Specifies the X-pitch and Y-pitch of the bump array in microns.

-repeat {i j}
    Specifies the X- and Y-dimensions of the array (i columns and j rows). The i
    and j arguments must be positive integers. If i*j does not match the specified
    num_bump, the tool chooses the smaller number between num_bump and i*j to
    create and place bumps.
```

```
-orientation N | W | S | E | FN | FE | FS | FW
    Specifies the orientation of the bump cells. Default is N.

-cell_origin lower_left | center
    Specifies the origin of the bump cell. Default is lower_left which means that
    the lower-left corner of a bump is placed at the specified matrix location.
    If the center option is used, the bump's center is placed at the specified
    matrix location.
```

DESCRIPTION

Creates flip chip bumps in the design and places them in a two-dimensional array pattern. The size of the array and the distances between two bumps are specified by the user. A flip chip bump is a special cell that generally consists of the topmost metal layer only. It is used to form electrical connections to the chip package.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates 24 flip chip bumps in an array of 2 by 12, starting at coordinate (100.500, 100.500) with an X-pitch of 1300um and Y-pitch of 200um between adjacent bumps.

```
prompt> place_flip_chip_array \
    -physical_lib_cell [get_physical_lib_cells BUMP] \
    -prefix "BUMP_CELL_" -number 24 \
    -start_point {100.500 100.500} -delta {1300 200} -repeat {2 12}
```

SEE ALSO

`place_flip_chip_ring(2)`

place_flip_chip_ring

Creates flip-chip bump cells and places them in a ring configuration.

SYNTAX

```
status place_flip_chip_ring
-physical_lib_cell {cell_name}
-prefix prefix
-number num_bump
-bump_spacing spacing
-ring_number ring_number
-ring_spacing ring_spacing
-boundary boundary_box
[-left_orientation N | W | S | E | FN | FS | FW | FE]
[-stagger_offset offset]
[-extra_spacing extra_spacing]
[-num_extra_spacing num_extra]
```

Data Types

<i>cell_name</i>	collection
<i>prefix</i>	string
<i>num_bump</i>	integer
<i>spacing</i>	distance
<i>ring_number</i>	integer
<i>ring_spacing</i>	distance
<i>boundary_box</i>	rectangle
<i>offset</i>	distance
<i>extra_spacing</i>	distance
<i>num_extra</i>	integer

ARGUMENTS

```
-physical_lib_cell {cell_name}
    Specify a collection of physical library cell reference. The collection must
    contain only one cell reference of the flip chip bump cells to be placed.

-prefix prefix
    Specifies a prefix string to be used for newly created bump cells.

-number num_bump
    Specifies a positive integer number of bump cells to be created and placed.

-bump_spacing spacing
    Specifies the minimum spacing between adjacent flip chip bump cells of the
    same ring in micron.

-ring_number ring_number
    Specifies a positive integer number of rings to be created.

-ring_spacing ring_spacing
    Specifies the spacing between adjacent rings in micron.
```

-boundary *boundary_box*
 Specifies the lower-left coordinate {llx lly} and up-right coordinate {urx ury} of the bounding box of the outermost ring in the format of {{llx lly} {urx ury}}.

-left_orientation N | W | S | E | FN | FS | FW | FE
 Specifies the orientation of bumps placed on the left edge of the ring. The top, right and bottom edge have an additional 90, 180 and 270 degrees of rotation respectively. Default is the N orientation.
 N rotate 0
 W rotate 90
 S rotate 180
 E rotate 270
 FN rotate 0 and mirror X
 FS rotate 0 and mirror Y
 FW rotate 90 and mirror X
 FE rotate 90 and mirror Y

-stagger_offset *offset*
 Specifies the stagger offset value between the first bump cells of two adjacent rings. The default is zero.

-extra_spacing *extra_spacing*
 Specifies additional spacing for a group of bump cells in micron. This option must be used together with -num_extra_spacing option to specify, for example, an addition spacing of 10um for every 5 bump cells. By default, there will be no additional spacing.

-num_extra_spacing *num_extra*
 Specifies the size of bump cell group for which additional spacing is inserted. This option should be used together with - extra_spacing option to specify, for example, an addition spacing of 10um for every 5 bump cells. By default, there will be no additional spacing. The num_extra should be a positive integer.

DESCRIPTION

The place_flip_chip_ring command creates flip chip bumps in the design and places them in a ring configuration. A flip chip bump is a special cell consists of a continuous metal pin placed on the topmost layer metal only. It is used to form electrical connection to the corresponding package bump on the chip packaging.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example creates 24 flip chip bumps and places them in 2 rings. The bump spacing is 10um and the ring spacing is 15um with the outer ring at coordinates (100,100), (900,900).

```
place_flip_chip_ring
1230
```

```
prompt> place_flip_chip_ring -physical_lib_cell {BUMP} -prefix "BUMP_CELL_"
-number 24 bump_spacing 10 -ring_number 2 -ring_spacing 15 -boundary {{100
100} {900 900}}
```

SEE ALSO

`place_flip_chip_array(2)`

place_fp_pins

Performs pin assignment for soft macros or at the block level.

SYNTAX

```
status place_fp_pins
[-block_level]
[-effort low | high]
[-verbose]
[soft_macros]
```

ARGUMENTS

-block_level
Performs pin assignment on the block of the top level cell, considering the connections within the soft macro rather than the top-level connections. By default, pin assignment is performed from the top-level design, considering the top-level connections.

-effort low | high
Specifies the method used to determine pin assignments. If you specify low effort (the default), a flyline-based algorithm is used. For top-level pin assignment (**-block_level** not specified), this algorithm considers all top-level connections for a soft macro pin before choosing the macro side to which the pin is assigned. For block-level pin assignment (**-block_level** specified), this algorithm considers all internal connections for a soft macro pin before choosing the macro side to which the pin is assigned. If you specify high effort, a global route-based algorithm is used. For top-level pin assignment, this algorithm performs global routing of the top-level connections and considers routing congestion as pins are placed. For block-level pin assignment, this algorithm performs global routing of the internal connections to determine the macro side to which the pin is assigned.
NOTE: If you require feedthrough creation (top-level pin assignment only), you must use high effort.

-verbose
Prints more information during command execution.

soft_macros
Specifies the soft macros on which to perform pin assignment. If you do not specify this argument, pin assignment is performed on all soft macros in the current design.

DESCRIPTION

This command places pins either along top cell boundary or on soft macros' boundary, depending on whether you specify the **-block_level** option. This command supports both rectangular and rectilinear soft macros.

For top-level pin assignment, the tool considers the top-level connections to plan groups, macros, and pads when determining the pin assignment. The pin assignments

are stored in the top-level design. If you open the soft macro design after pin assignment to view the result and then close it without saving it, the pins are discarded.

For block-level pin assignment, the tool considers the internal cell placement and connections when determining the pin assignment. And pins are assigned along top cell boundary.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses top-level pin assignment to assign pins to soft macros macroA and macroB using the global route-based method.

```
prompt> place_fp_pins -effort high [get_cells "macroA macroB"]
```

SEE ALSO

`set_fp_pin_constraints(2)`

place_freeze_silicon

Automatically places new cell instances by swapping out spare cells. This command is typically used in a freeze silicon ECO flow.

SYNTAX

```
status place_freeze_silicon
```

DESCRIPTION

The **place_freeze_silicon** command automatically places cell instances added during ECO. It does not move previously placed cells. Only new cells added by ECO are placed. ICC replaces the new cell instances with existing spare cells of the same reference library cell, or of the same gate_array_master_type attribute. First, ICC runs a fast placement of the new cell instances and then places each new instance at its closest matching spare cell.

An ECO routing command can then be used to complete the routing. The freeze silicon capability can be used to implement metal-only ECO changes an existing layout.

PREREQUISITES

The ECO changes need to be applied before running this command. The **read_mw_eco_list** or **update_mw_design_eco** commands can be used for this purpose. Set matching spare library cell and eco library cell to have the same gate_array_master_type.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

```
set_attribute(2)
read_mw_eco_list(2)
route_eco(2)
```

place_io_pads

Adjusts the placement of unconstrained pins and pads.

SYNTAX

```
status place_io_pads
[-io_style io_style | flipchip | center | core | distribute | abut | old]
[-adjust_core no_change | macro_and_region | offset_from_pads]
[-left_to_core double]
[-right_to_core double]
[-top_to_core double]
[-bottom_to_core double]
[-min_pad_height]
```

ARGUMENTS

```
-io_style netweighted | flipchip | center | core | distribute | abut | old
    Specifies the IO style to use for distributing the pads. The default is
    distribute.
    netweighted - Optimizes I/O pads based on the net length and net weight.
    flipchip - Optimizes the Flip Chip driving cell's location based on the
    corresponding bump.
    center - Pulls pads to the center of each side.
    core - Distributes pads evenly on each side within the area defined by the
    core.
    distribute - Distributes pads evenly on each side without regard to the core.
    abut - Distributes pads evenly on each side without regard to the core, abutting
    left/right and top/bottom pads.
    old - Meets constraints with no biasing.

-adjust_core no_change | macro_and_region | offset_from_pads
    Specifies the method you want to use for determining the core area. The
    default is no_change.
    no_change - Uses the existing core area.
    macro_and_region - Adjusts the core area to the minimum size required to
    enclose the macros and cell regions.
    offset_from_pads - Adjusts the core area while maintaining offsets from the
    pads.

-left_to_core double
    Specifies the distance to put between the core and the left side of the
    boundary. The tool uses this value to adjust the cell boundary.

-right_to_core double
    Specifies the distance to put between the core and the right side of the
    boundary. The tool uses this value to adjust the cell boundary.

-top_to_core double
    Specifies the distance to put between the core and the top of the boundary.
    The tool uses this value to adjust the cell boundary.
```

```
-bottom_to_core double
    Specifies the distance to put between the core and the bottom of the boundary.
    The tool uses this value to adjust the cell boundary.

-min_pad_height
    Sets the core area based on the minimum pad height.
```

DESCRIPTION

This command adjusts the placement of unconstrained pins/pads. Optionally, this command also adjusts the size of the core area and the size of the cell boundary.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example runs the command in default settings.

```
prompt> place_io_pads
1
```

```
place_io_pads
1236
```

place_opt

Performs simultaneous placement, routing, and optimization on the design.

SYNTAX

```
status place_opt
[-effort low | medium | high]
[-area_recovery]
[-optimize_dft]
[-congestion]
[-power]
[-cts]
[-num_cpus number_of_cpus]
```

Data Types

number_of_cpus int

ARGUMENTS

-effort low | medium | high

Specifies the effort level for **place_opt**. If you specify **high**, **place_opt** spends more time to further improve the quality of results (QoR). If you specify **low**, **place_opt** spends less time on improving the quality of results (QoR). The default effort level is **medium**.

-area_recovery

Enables area recovery for the cells not on the timing critical paths. By default, this option is off.

-optimize_dft

Enables placement aware scan reordering. The reordering is based on SCANCHAINS section of input DEF file, and aims to reduce the scan chain wirelength, minimize congestion and improve routability. Prior to using this option you must first use the **read_def** command to read in scan chain information of the design.

-congestion

Enables congestion removal algorithms for improved routability. By default, this option is off.

-power

Enables different power optimization in **place_opt**. The power optimization features are determined by the command's set_power_options. By default the tool runs leakage power optimization when you use the **-power** option. This option can be combined with all other current options to **place_opt**. This includes the **-area_recovery** option and the **-effort (low | medium | high)** option. By default, this option is off.

-cts

Enables clock tree compilation, optimization, and routing within the **place_opt** flows. It allows the optimization engine to work with propagated

clock network delays. When you specify this option, it expects to have all clock related constraints specified before invoking the **place_opt** command.

-num_cpus number_of_cpus

Specifies the number of CPUs used in parallel during coarse placement. The *number_of_cpus* is an integer value that is less than or equal to the number of free CPUs on your machine and greater than or equal to . The default is **1**.

DESCRIPTION

This command performs simultaneous placement, routing, and optimization on the current design. The output of this command is a legally placed netlist. If **-cts** is specified, then the output also includes fully synthesized, optimized, routed and extracted clock network.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example runs the **place_opt** command in timing-driven mode.

```
prompt> place_opt
```

```

Data Types

<i>collection_of_cells</i>	collection
<i>collection_of_nets</i>	collection
<i>layer_from_tech_file</i>	string
<i>h_layer</i>	string

<i>v_layer</i>	string
<i>one_d_pin_dist</i>	float
<i>connection_width</i>	float
<i>pin_connection_offset</i>	float
<i>special_rules_name</i>	string
<i>space_threshold</i>	float

ARGUMENTS

-ignore_macros
 Prevents connection of pins in macro cells.

-ignore_pads
 Prevents connection of pins in pad cells.

-ignore_cover_cells
 Prevents connection of pins in cover cells.

-consider_driver_cells
 Connects pins in flip-chip driver cells.

-connect_instances all_but_specified | specified | specified
 Specifies the instances to connect as **all_but_specified** or **specified**. You can use the **-cells** option to specify names, if necessary. The default is **all_but_specified**.

-cells {collection_of_cells}
 Specifies a collection of instances to use for the **-connect_instances** option.

-target_directions four_sides | vias_only | vias_only
 Specifies how to connect pins. Use the **four_sides** argument to connect pins in the directions of the four cell sides. Use the **vias_only** argument to connect pins only by dropping vias to the upper-layer and lower-layer targets. The default is **four_sides**.

-skip_left_side
 Selects to skip the left side of the instance you do not want connected when you use the **-target_directions** option with the **four_sides** argument.

-skip_right_side
 Selects to skip the right side of the instance you do not want connected when you use the **-target_directions** option with the **four_sides** argument.

-skip_bottom_side
 Selects to skip the bottom side of the instance you do not want connected when you use the **-target_directions** option with the **four_sides** argument.

-skip_top_side
 Selects to skip the top side of the instance you do not want connected when you use the **-target_directions** option with the **four_sides** argument.

-skip_vias_to_lower_layer
 Prevents the dropping of vias to the lower layer, when you use the **-target_directions** option with the **vias_only** argument.

```

-skip_vias_to_higher_layer
    Prevents the dropping of vias to the higher layer, when you use the -target_directions option with the vias_only argument.

-select_net_by_type pg | tieup_and_tiedown | pg_and_tieup_tiedown | specified |
tieup_and_tiedown | pg_and_tieup_tiedown | specified
    Specifies the type of nets to connect instances, using one of four valid values. The default is pg.

-nets {collection_of_nets}
    Specifies nets to be used for the -select_net_by_type option. If there is more than one net in the collection, separate each one by a space.

-route_pins_on_layer layer_from_tech_file
    Connects only pins on specified layer. Valid values for the layer_from_tech_file argument are layerNumber or maskName from the technology file. The default is to connect pins on all layers.

-primary_routing_layer preferred | pin | specified | pin | specified
    Specifies how to pick the layer on which to route. The valid arguments are preferred, pin, and specified. Use preferred to route on preferred metal layers. You can refine this choice by specifying the -preferred_routing_layer option. Use pin to route on the same layer on which the pins are located. Use specified to route on layers specified by the -specified_horizontal_layer and -specified_vertical_layer options.

-preferred_routing_layer high | low
    Specifies whether to route first on lower from pin, or higher from pin preferred metal layer when you use the -primary_routing_layer option with the preferred argument. Valid arguments are: high and low. Specify high to route on the next available higher preferred layer. If a higher preferred layer is not available, route on an available lower preferred layer. Specify low to route on the next available lower preferred layer. If a lower preferred layer is not available, route on an available higher preferred layer.

-specified_horizontal_layer h_layer
    Specifies the horizontal layers to route when you use the -primary_routing_layer option with the specified argument. Valid values for the layer_from_tech_file argument are layerNumber or maskName from the technology file. The default is the first horizontal layer.

-specified_vertical_layer v_layer
    Specifies the vertical layers to route when you use the -primary_routing_layer option with the specified argument. Valid values for the layer_from_tech_file argument are layerNumber or maskName from the technology file. The default is the first vertical layer.

-pad_pin_to_pad_boundary distance
    Specifies the nearness ratio of pin to pad boundary. Pins routed by the preroute_instances command must be near the boundary across which they are to be routed. The nearness test is determined by the bounding box of a pin and pad and the corresponding routing ratio. You can assume that pads are rectangular (but remember that if they are not, their bounding boxes are used). For example, for a left boundary pad, the command routes all pins to the right if the distance between a pin's right edge and that of the pad is

```

less than 0.1 times the distance between the left and right edges of the pad. The default 0.1.

Note that for macro cells, only "small" pins are considered. Small pins are those with x-dimension and y-dimension that both fail the `-one_d_pin` pin test.

-one_d_pin one_d_pin_dist

Specifies the nearness ratio of either the x-dimension and y-dimension of a pin to macro cell dimension. If exactly one dimension of the bounding box of a multi-rectangle pin is greater than or equal to 0.75 times the corresponding dimension of the macro, the pin is a 1-D pin. A 1-D pin is routed along its length, unless you turn on the **-customize** option to switch to routing along its width. The default is 0.75.

-boundary_pad_to_top_cell_boundary distance

Specifies the nearness ratio of a pad to the top cell boundary. For example, a pad near the top cell's left boundary is a boundary pad if the distance between its left edge and the top cell's left boundary is less than or equal to 0.05 times the distance between its left and right edges. Non-boundary pads are treated as macros. When a boundary pad is routed toward the core, only one side is routed. Corner pads are boundary pads that pass this test for two top cell boundaries, and they are not routed toward the core. Pad rings can be generated only for boundary pads. The default is 0.05.

-macro_pin_to_macro_boundary distance

Specifies the nearness ratio of a small pin to a macro boundary. The default is 0.1.

-customize

Customizes connections to `one_d_pin` pins.

-routing_width connection_width

Specifies the width of the connection to the macro or pad pins when using the **-customize** option. You might need to customize connections if you have 1-D pins.

-connect_to_pins_at center | low_end | high_end | low_end | high_end

Specifies where to connect wires to pin when using the **-customize** option.

Valid values are **center**, **low_end**, and **high_end**. Use **center** to connect to the center of the pins. Use **low_end** to connect to the left or bottom end of the pins. Use **high_end** to connect to the right or top end of the pins. The default is **center**.

-offset pin_connection_offset

Specifies the distance by which you want to offset the pin connection from the center, low end, or high end when using the **-customize** option. The default is 0.0.

-extend_to_boundaries_and_generate_pins

Creates a power and ground extension wire to the cell boundary and generates a power and ground pin for the extension wire, if the top cell does not have pads. The pin is marked as fixed to prevent it from being moved by placement and routing operations. To extend wires, the following conditions must be met:

- The power and ground pin cannot be already connected to power and ground in the direction where the **preroute_standard_cells** command would create the extension wire.

- Creating the power and ground extension wire does not cause a design rule violation.

-force_extend_to_boundaries_and_generate_pins

Forces execution of the **-extend_to_boundaries_and_generate_pins** option, even if the power and ground pin is already connected to power and ground.

-route_small_pins_using_wider_dimension

Specifies for the **preroute_instances** prerouter to always connect to the wider side of a small pin. A small pin is routed only if it is close enough to at least one boundary. If so, the pin is routed toward and, most likely, out of the closest boundary to the first target and the connection is made to the corresponding side of the pin. As a result, the prerouter might connect to the narrower or the wider side of a small pin. This option directs it to the wider side.

-route_boundary_coinciding_edges_only

Controls exactly the widths and locations of the connections to the pins. This option forces the prerouter to connect only the edges of the pins that are co-linear with a boundary, using the edge width of the pin.

-skip_pad_pins_touching_pad_side_boundaries

Skips those pad pins that touch the side boundaries of pads.

-advanced_via_rules

Uses advanced via rules that have been previously set.

-special_rules *special_rules_name*

Refers to a set of special rules specified by the **set_preroute_special_rules** command. The value of the *special_rules_name* argument must be exactly the same as the string specified in the **-name** option of that command.

-extend_for_multiple_connections

Extends normal pin connections to reach more targets on the same net. The extension continues until either of the following conditions are true:

- There are no more targets in the respective directions.
- The next target exceeds the spacing threshold set by using the **-extension_gap** option.

-extension_gap *space_threshold*

Specifies the space threshold for multiple connections. Adjacent targets closer than the value of the *space_threshold* argument are connected together.

-undo

Removes connections created by the last run of the **preroute_instances** command.

DESCRIPTION

This command connects pins in macros and pads to trunks or other pins on the same net. The width of the connection is the same as the width of the originating pin, unless otherwise changed. You can change the internal application of design rule checking (DRC) rules by using the **set_preroute_drc_strategy** command.

Prerequisites

Specify port-to-net connections for power and ground nets that are not in the netlist by using the **derive_pg_connection** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example preroutes all macro, pad, and cover instances, except those specified in the **-cells** option, with nets VDD and VSS, only for pins on layer M3 only.

```
prompt> preroute_instances\  
-connect_instances all_but_specified\  
-cells {hier_1/i_ram0/i_testA/uMEM hier_1/i_ram7/i_testB/uMEM}\  
-nets {VDD VSS}\  
-route_pins_on_layer M3
```

The following example connects left and right I/O pads with a ring following special rules specified by the **set_preroute_special_rules** command.

```
prompt> preroute_instances\  
-nets VDD\ -ignore_macros\  
-ignore_cover_cells -skip_bottom_side\  
-skip_top_side -primary_routing_layer pin\  
-route_pins_on_layer PM\  
-special_rules specIOhor
```

See the **set_preroute_special_rules(2)** man page, 4th example) for more detail.

```

ARGUMENTS

```
-mode rail | tie | net
    Specifies one of three modes for standard cell connections:
    * rail to connect standard cells by rails
    * tie to connect standard cells by tying all the
        power and ground pins to nearby targets
    * net to connect the pins of standard cells to a nearby
        power ring or strap by creating Steiner tree with restrictions
        (see options -max_fanout, -h_layer, -v_layer, -h_width, -v_width below).
    The default is rail.
```

```
-connect horizontal | vertical | both
    Specifies the direction of the power and ground connections: horizontal |
vertical | both.
    The default is horizontal.
```

```
-nets {collection_of_nets}
    Specifies the nets used to connect standard cells.
    By default, power and ground nets are used.
```

```
-route_pins_on_layer layer
    Specifies to connect pins on the specified metal layer only. You can specify
    the value either as the layerNumber or the maskName from the technology file.
    By default, all pins on all layers are connected.
```

```
-within {{llx lly} {urx ury}}
    Specifies the area within which to connect pins.
    By default, the top cell boundary box is used.
```

```
-no_routing_outside_working_area
    Prevents standard cell connections from extending beyond the specified
    working area. The default is false, so that if this option is skipped,
    connections can extend beyond the area specified in the within option.
```

```
-special_via_rule
    Creates a matrix of small vias instead of one large via at wire intersections.
    Using smaller vias could free some routing space. You must specify the x and
    y offsets, size, and step by using the -offset_both_sides_for_special_via,
-special_via_x_offset, -special_via_y_offset, -special_via_x_size,
-special_via_y_size, -special_via_x_step, and -special_via_y_step options.
```

```
-offset_both_sides_for_special_via
    Applies the x- and y-offsets to both the lower left and upper right corners
    of the wire intersection area.
    By default, the offsets are applied only to the lower left corner of the wire
    intersection area.
```

```
-special_via_x_offset distance
    -special_via_y_offset distance
    Specifies the x- and y-offset from the lower left corner of the wire
    intersection area where you want to create the first special via.
    The default is 0.0.
```

-special_via_x_size *distance*
-special_via_y_size *distance*
 Specifies the size of the special vias. The number you type is the x- or y-length in your units.

-special_via_x_step *distance*
-special_via_y_step *distance*
 Specifies the x- and y-distance between the special vias. The distance is in user units, between two left sides of adjacent via cuts in the x-direction, and between two bottom sides of adjacent via cuts in the y-direction. When there are design rule violations, some vias might not be created.

-skip_macro_pins
 Specifies not to connect standard cells to macro pins.

-skip_pad_pins
 Specifies not to connect standard cells to pad pins.

-remove_floating_pieces
 Specifies to remove floating (unconnected) rail segments. They are kept by default.

-pin_width_by_extreme_edges
 Determine pin widths by the width of the pin at its extreme edges.

-pin_width_by_most_extended_pin
 Determine pin widths by the width of the most extended pin.

-tie_mode_max_route_width *distance*
 Specifies the maximum routing width for **tie** mode. The default of 0.0 means no limit.

-extend_to_boundaries_and_generate_pins
 Creates a power and ground extension wire to the cell boundary and generates a power and ground pin for the extension wire, if the top cell does not have pads. The pin is marked as fixed to prevent it from being moved by placement and routing operations. To extend wires, the following conditions must be met:
 a) The power and ground pin is not already connected to power and ground in the direction where **preroute_standard_cells** would create the extension wire.
 b) Creating the power and ground extension wire does not cause a design rule violation.

-force_extend_to_boundaries_and_generate_pins
 Forces the **-extend_to_boundaries_and_generate_pins** option, even if the power and ground pin is already connected to power and ground.

-avoid_merging_vias
 Prevents the merging of existing vias.

-optimize_via_locations
 Adjusts the vias by small distances horizontally or vertically so that more

tracks are saved for detail routing.

-snap_shapes_to_tracks
 Allows you to request that all newly created shapes are placed (snapped) onto tracks of appropriate metal layers.
 This option can be used only if the standard cell pins are connected using **-mode net**. If a connection cannot meet the requirement, the command should leave the pins unconnected.

-do_not_route_over_macros
 Prevents the prerouter from generating wires over macro cells. By default, this option is off. If you enable it, the tool removes the parts of a route that go over a macro.

-fill_empty_rows
 Fills all rows, even those without cells, with power and ground rails.

-cut_out_empty_spans
 Prevents creation of rails between neighboring power straps or rings of the net if no standard cell pins of the net are found in that area.

-extend_for_multiple_connections
 Extends the low and high ends of the standard cell connections to reach more targets on the same net. The extension continues until either there are no more targets in the respective directions, or the next target exceeds the spacing threshold set in the **-extension_gap** option. This option is off by default.

-extension_gap *distance*
 Specifies the space threshold for multiple connections. Adjacent targets closer than this value are connected together.

-num_cpu *int_number*
 Specifies the number of CPUs (greater than one) used for distributed routing when the routing process can be computed in parallel on the distributed machines. This option can speed up the routing process significantly for large designs. You must set up the working machines setup before running this command (see the **set_distributed_route** man page for more information). The specified number of CPUs should not exceed the number of setup CPUs.

-max_fanout *int_number*
 Specifies the maximum number of pins in a tree connecting them to a ring or strap (for **-mode net** only). The default is 10.

-h_layer *name_of_metal_layer*
 Specifies the routing layer to be used for horizontal segments (for **-mode net** only). If the layer is not set (or is not a routing layer), the command sets the layer automatically.

-v_layer *name_of_metal_layer*
 Specifies the routing layer to be used for vertical segments (for **-mode net** only). If the layer is not set (or is not a routing layer), the command sets the layer automatically.

-h_width *distance*
 Specifies the width of horizontal segments (for **-mode net** only). If the width is 0.0 (the default value), the command uses a width of the thinnest pin in a set. If the width does not correspond to the maximum or minimum width of the layer, it is adjusted automatically.

-v_width *distance*
 Specifies the width of vertical segments (for **-mode net** only). If the width is 0.0 (the default value), the command uses a width of the thinnest pin in a set. If the width does not correspond to the maximum or minimum width of the layer, it is adjusted automatically.

-port_filter *pattern*
 Specifies list of patterns to be tested against a pin name to decide whether it should be routed. Each pattern can contain a regular expression. Patterns must be separated by commas. Default is *.**

-cell_master_filter *pattern*
 Specifies list of patterns to be tested against a reference cell name to decide whether its pins should be routed. Each pattern can contain a regular expression. Patterns must be separated by commas. Default is *.**

-cell_instance_filter *pattern*
 Specifies list of patterns to be tested against a cell name to decide whether its pins should be routed. Each pattern can contain a regular expression. Patterns must be separated by commas. Default is *.**

-voltage_area_filter *pattern*
 Specifies list of patterns to be tested against the name of the voltage area where a cell placed to decide whether its pins should be routed. Each pattern can contain a regular expression. Patterns must be separated by commas. Default is *.**

-port_filter_mode off | select | skip
 Specifies one of three modes for the port filter:
 * **off** ignores the filter (this is the default mode)
 * **select** selects a pin for routing if its name corresponds to at least one pattern of the filter
 * **skip** excludes a pin from routing if its name corresponds to at least one pattern of the filter.

-cell_master_filter_mode off | select | skip
 Specifies one of three modes for the cell master filter:
 * **off** ignores the filter (this is the default mode)
 * **select** selects pins of a cell for routing if the name of its reference corresponds to at least one pattern of the filter
 * **skip** excludes pins of a cell from routing if the name of its reference corresponds to at least one pattern of the filter

-cell_instance_filter_mode off | select | skip
 Specifies one of three modes for the cell instance filter:
 * **off** ignores the filter (this is the default mode)
 * **select** selects pins of a cell for routing if its name corresponds to at least one pattern of the filter
 * **skip** excludes pins of a cell from routing if its name

```

corresponds to at least one pattern of the filter

-voltage_area_filter_mode off | select | skip
Specifies one of three modes for the voltage area filter:
* off ignores the filter (this is the default mode)
* select selects pins of the cell for routing if the name
of the voltage area in which it is placed corresponds to at
least one pattern of the filter
* skip excludes pins of a cell from routing if the name of
the voltage area in which it is placed corresponds to at least
one pattern of the filter

-undo
Removes connections created by the last preroute_standard_cells run.

```

DESCRIPTION

The **preroute_standard_cells** command connects power and ground pins in the standard cells to the power and ground rings or straps, and connects power and ground rails in the standard cells.

You can change the internal application of DRC rules by using the **set_preroute_drc_strategy** command.

Prerequisites:

Specify port-to-net connections for power and ground nets that are not in the netlist by using the **derive_pg_connection** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

To preroute standard cells in both direction by rail (the default mode) with the VDD and VSS nets, for pins on the metal 3 layer only, within the boundaries of (10.0 10.0)(1400.0 1400.0), enter

```

prompt> preroute_standard_cells\
-nets {VDD VSS} -connect both\
-route_pins_on_layer M3\
-within {{10.0 10.0} {1400.0 1400.0}}

```

print_message_info

Prints information about diagnostic messages which have occurred or have been limited.

SYNTAX

```
string print_message_info
[-ids id_list] [-summary]
```

Data Types

id_list list

ARGUMENTS

-ids *id_list*

List of message identifiers to report. Each entry can be a specific message or a glob-style pattern which matches one or more messages. If this option is omitted and no other options are given, then all messages which have occurred or have been limited will be reported.

-summary

Generate a summary of error, warning and informational messages which have occurred so far.

DESCRIPTION

The **print_message_info** command enable you to print summary information about error, warning, and informational messages which have occurred or have been limited with the **set_message_info** command. For example, if the following message is generated, information about it is recorded.

```
Error: unknown command 'wrong_command' (CMD-005)
```

It is useful to be able to summarize all recorded information about generated diagnostic messages. Much of this can be done using the **get_message_info** command but you need to know a specific message id. By default, **print_message_info** will summarize all of the information. It will provide a single line for each message which has occurred or has been limited, and one summary line which shows the total number of errors, warnings, and informational messages which have occurred so far. If an *id_list* is given, then only messages matching those patterns will be displayed. If **-summary** is given, then a summary will be displayed.

Using a pattern in the *id_list* is intended to show a specific message prefix, for example, "CMD*". Note that this will not show all messages with that prefix. Only those which have occurred or have been limited will be displayed.

EXAMPLES

The following example uses **print_message_info** to show a few specific messages.

```
prompt> print_message_info -ids [list "CMD*" APP-99]
```

Id	Limit	Occurrences	Suppressed
CMD-005	0	7	2
APP-99	1	0	0

At the end of the session, you might want to generate some information about a set of interesting messages, such as how many times each occurred (which includes suppressions), how many times each was suppressed, and whether a limit was set for any of them. The following shows how to use `print_message_info` in this way.

```
prompt> print_message_info
```

Id	Limit	Occurrences	Suppressed
CMD-005	0	12	0
APP-027	100	150	50
APP-99	0	1	0

Diagnostics summary: 12 errors, 150 warnings, 1 informational

Note that the suppressed count is not necessarily the difference between the limit and the occurrences, since the limit can be dynamically changed with `set_message_info`.

`set_message_info(2)`
`suppress_message(2)`

print_proc_new_vars

Check for new variables created within a Tcl procedure.

SYNTAX

```
string print_proc_new_vars
```

DESCRIPTION

The **print_proc_new_vars** command is used in a Tcl procedure to show new variables created up to that point in the procedure. If the **sh_new_variable_message_in_proc** and **sh_new_variable_message** variables are both set to true, this command is enabled. If either variable is false, the command does nothing. The result of the command is always empty.

When enabled, the command will issue a CMD-041 message for each variable created in the scope of the procedure so far. Arguments to the procedure are excluded.

For procedures which are in a namespace (that is, not in the global scope), **print_proc_new_vars** also requires that you have defined some aspect of the procedure using **define_proc_attributes**.

Warning: This feature has a *significant* negative impact on CPU performance. This should be used only when developing scripts or in interactive use. When you turn the feature on, the application issues a message (CMD-042) to warn you about the usage of this feature.

EXAMPLES

Given that the appropriate control variables are true, the following commands show new variables created within procedures:

```
prompt> proc new_proc {a} {                                set x $a
               set y $x
               unset x
               print_proc_new_vars
}
prompt> new_proc 67
=New variable report for new_proc:
Information: Defining new variable 'y'. (CMD-041)
=END=
prompt>
prompt> proc ns::p2 {a} {                                set x $a
               print_proc_new_vars
}
prompt> define_proc_attributes ns::p2
prompt> ns::p2 67
=New variable report for ns::p2:
Information: Defining new variable 'x'. (CMD-041)
=END=
```

SEE ALSO

`define_proc_attributes(2)`
`sh_new_variable_message(3)`
`sh_new_variable_message_in_proc(3)`

print_suppressed_messages

Displays an alphabetical list of message ids that are currently suppressed.

SYNTAX

string **print_suppressed_messages**

DESCRIPTION

The **print_suppressed_messages** command displays all messages that you suppressed using **suppress_message**. The display lists in alphabetical order. You only can suppress informational and warning messages. The result of **print_suppressed_messages** is always the empty string.

EXAMPLES

This example shows the output from **print_suppressed_messages**.

```
prompt> print_suppressed_messages
No messages are suppressed
prompt> suppress_message {XYZ-001 CMD-029 UI-1}
prompt> print_suppressed_messages
The following 3 messages are suppressed:
    CMD-029, UI-1, XYZ-001
```

SEE ALSO

suppress_message(2)
unsuppress_message(2)

printenv

Prints the value of environment variables.

SYNTAX

```
string printenv
[variable_name]
```

Data Types

```
variable_name      string
```

ARGUMENTS

```
variable_name
    Optional name of a single environment variable to print.
```

DESCRIPTION

Prints the values of the environment variables inherited from the parent process or set from within the application with **setenv**. With no arguments, all environment variables are listed. With a single *variable_name*, if that variable exists, its value is printed. There is no useful return value from **printenv**.

To retrieve the value of a single environment variable, use **getenv**.

EXAMPLES

These examples show the output from **printenv**.

```
prompt> printenv SHELL
/bin/csh
prompt> printenv EDITOR
emacs
```

SEE ALSO

```
getenv(2)
setenv(2)
```

printvar

Prints the values of one or more variables.

SYNTAX

```
string printvar
[pattern] [-user_defined] [-application]
```

Data Types

pattern string

ARGUMENTS

pattern

Variable names which match *pattern* will be printed. The optional *pattern* argument can include the wildcard characters "*" and "?". If omitted, all variables are printed.

-user_defined

Show only user-defined variables. If combined with -application, the behavior is as though neither option was used.

-application

Show only application variables. If combined with -user_defined, the behavior is as though neither option was used.

DESCRIPTION

The **printvar** command prints the values of one or more variables. If the *pattern* argument is not specified, the command prints out the values of all the variables (both application and user defined variables). The -user_defined option limits the variables to those which you have defined. The -application option limits the variables to those created by the application. If both options are used, they cancel each other out.

Some variables are suppressed from the output of **printvar**. For example, the Tcl environment variable array *env* is not shown. In order to see the environment variables, use the **printenv** command. Also, the Tcl variable *errorInfo* is not shown. To see the error stack, use the **error_info** command.

EXAMPLES

The following command prints the values of all the variables.

```
prompt> printvar
```

The following command prints the values of all application variables that match the pattern *sh*a**.

```
prompt> printvar -application sh*a*
sh_arch = "sparcOS5"
sh_command_abbrev_mode = "Anywhere"
sh_enable_page_mode = "false"
sh_new_variable_message = "false"
sh_new_variable_message_in_proc = "false"
sh_source_uses_search_path = "false"
```

The following command prints the value of the variable search_path.

```
prompt> printvar search_path
search_path = ". /designs/newcpu/v1.6 /lib/cmos"
```

The following command prints the value of the user defined variables.

```
prompt> printvar -user_defined
a = "6"
designDir = "/u/designs"
```

SEE ALSO

proc_args

Displays the formal parameters of a procedure.

SYNTAX

```
string proc_args
proc_name
```

Data Types

```
proc_name      string
```

ARGUMENTS

```
proc_name
    Specifies the name of the procedure.
```

DESCRIPTION

The **proc_args** command is used to display the names of the formal parameters of a user defined procedure. This command is essentially a synonym for the Tcl builtin command **info** with the *args* argument.

EXAMPLES

This example shows the output of **proc_args** for a simple procedure.

```
prompt> proc plus {a b} {return [expr $a + $b]}
prompt> proc_args plus
a b
prompt> info args plus
a b
prompt>
```

SEE ALSO

```
info(2)
proc_body(2)
```

proc_body

Displays the body of a procedure.

SYNTAX

```
string proc_body
proc_name
```

Data Types

proc_name string

ARGUMENTS

proc_name
Specifies the name of the procedure.

DESCRIPTION

The **proc_body** command is used to display the body (contents) of a user defined procedure. This command is essentially a synonym for the Tcl builtin command **info** with the *body* argument.

EXAMPLES

This example shows the output of **proc_body** for a simple procedure.

```
prompt> proc plus {a b} {return [expr $a + $b]}
prompt> proc_body plus
   return [expr $a + $b]
prompt> info body plus
   return [expr $a + $b]
prompt>
```

SEE ALSO

info(2)
proc_args(2)

process_particle_probability_file

Encrypts or decrypts the particle probability function file.

SYNTAX

```
process_particle_probability_file
-key
-input_file
[-output_file ]
```

ARGUMENTS

-key encryption_key

This is the key used to encrypt/decrypt the particle probability function file. The value of string could be a combination of alphabets and numbers. It should be at least 8 characters long. The key specified for encryption of a file must be identical to that specified for decryption. This command fails if they do not match. It is a mandatory option.

-input_file filename

Specify the particle probability file name. If input file is in ascii format, output is an encrypted file. If input file is an encrypted file, output is an ascii file.

-output_file

Specify the output file. To specify this is optional. If it is not specified, this name is derived by appending "_out" to the input file name.

DESCRIPTION

This command encrypts or decrypts the particle probability function file. This encryption protects the content of the particle probability file. An encrypted particle probability file can be specified as input to the **report_critical_area** command. There is no need to specify the key for that command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command performs encryption of particle probability function file.

```
prompt> process_particle_probability_file \
-key abc123456 -input_file "datafile.txt" \
-output_file "datafile.enqr"
```

SEE ALSO

`report_critical_area(2)`

propagate_constraints

Propagates timing constraints from lower levels of the design hierarchy to the current design.

SYNTAX

```
status propagate_constraints
[-design design_list]
[-all]
[-clocks]
[-disable_timing]
[-dont_apply]
[-false_path]
[-gate_clock]
[-ideal_network]
[-ignore_from_or_to_port_exceptions]
[-ignore_through_port_exceptions]
[-max_delay]
[-min_delay]
[-multicycle_path]
[-operating_conditions]
[-power_supply_data]
[-output file_name]
[-port_isolation]
[-verbose]
[-case_analysis]
[-target_library_subset]
```

Data Types

<i>design_list</i>	list
<i>file_name</i>	string

ARGUMENTS

-design *design_list*
Specifies a list of names of lower-level designs from which constraints are to be propagated. The constraints are propagated from every instance of the designs in this list. By default, constraints are propagated from every lower-level design in the hierarchy.

-all
Specifies to propagate clocks, **gate_clock** checks, **false_path** exceptions, **multicycle_path** exceptions, **max_delay** and **min_delay** exceptions, instance specific operating conditions, power supply data, and **disable_timing** attributes. This is the default. Issuing the command without options has the same effect as specifying the **-all** option.

-clocks
Specifies to propagate only clocks previously created by using the **create_clock** command. Virtual clocks are not propagated. By default, this option is off.

-disable_timing
Specifies to propagate only **disable_timing** attributes previously set by using the **set_disable_timing** command. By default, this option is off.

-dont_apply
Specifies that the propagated constraints are not to be applied to the current design. Warnings are still reported. You can use this option with the **-verbose** option to see the effect of running the command, without actually running it. If you do not use the **-verbose** option, the command displays warnings regarding conflicting exceptions. By default, this option is off.

-false_path
Specifies to propagate only **false_path** exceptions previously specified by using the **set_false_path** command. By default, this option is off.

-gate_clock
The **propagate_constraints -gate_clock** option will be obsolete in a future release. Clock-gating insertion with **compile_ultra -gate_clock** automatically propagates clock gate setup and hold time.
Specifies to propagate upwards only setup and hold clock gating checks previously specified by using the **set_clock_gating_check** command. RTL clock gating automatically imposes setup and hold time constraints during elaboration. By default, this option is off.

-ideal_network
Specifies to propagate ideal networks previously created by using the **set_ideal_network** command. By default, this option is off.

-ignore_from_or_to_port_exceptions
Specifies to propagate exceptions for ports on *from_lists* and/or *to_lists* of commands that set timing constraints. By default, the command converts from port and to port exceptions into through exceptions and propagates them to the current design. By default, this option is off.

-ignore_through_port_exceptions
Specifies not to propagate exceptions for ports on *through_lists* of commands that set timing constraints. By default, these exceptions are propagated.

-max_delay
Specifies to propagate only **max_delay** exceptions previously specified by using the **set_max_delay** command. By default, this option is off.

-min_delay
Specifies to propagate only **min_delay** exceptions previously specified by using the **set_min_delay** command. By default, this option is off.

-multicycle_path
Specifies to propagate only **multicycle_path** exceptions previously specified by using the **set_multicycle_path** command. By default, this option is off.

-operating_conditions
Specifies to propagate only **operating_conditions** previously specified by using the **set_operating_condition** command. It propagates the operating conditions specified on instances as well as those specified on lower level sub-designs. By default, this option is off.

```

-power_supply_data
    Specifies to propagate only power intent data, including UPF (supply network,
    power state table, and various power intent strategies) and operating
    voltages on the supply nets. By default, this option is off.

-output file_name
    Specifies to write the command output to file specified by file_name. By
    default, this option is off.

-port_isolation
    Specifies to propagate exceptions previously set by the set_isolate_ports
    command. By default, this option is off.

-verbose
    Echos equivalent commands that are applied to the current design by using the
    propagate_constraints command. Following each propagated constraint, the
    name enclosed in /* */ is the name of the lower-level design from which the
    constraint is propagated. By default, this option is off.

-case_analysis
    Specifies to propagate user case values previously set by using the
    set_case_analysis command. By default, this option is off.

-target_library_subset
    Specifies to propagate target library subsets that have been specified by
    using the set_target_library_subset command. It propagates the target library
    subset specified on instances as well as those specified on subdesigns. By
    default, this option is off.

```

DESCRIPTION

This command collects constraints from instances of lower-level designs and applies those constraints to the current design for use during timing analysis and compilation. Once the constraints are propagated, they can be removed, overridden, or reported like any other constraints that are set on the current design. Issuing the command without options is the same as issuing it with the **-all** option.

The command produces a warning in some cases where it does not propagate constraints because of one of the following conditions:

- Clock name conflict: multiple clocks from different designs have the same name.
- Clock source conflict: an object is specified as a clock source of more than one clock.
- Clock exception from/to unpropagated clock: if a clock is not propagated, exceptions from or to the clock are not propagated. The command does not propagate a clock if you do not use the **-clock** option, if the clock is a virtual clock, or if propagating the clock creates a conflict.

The command does not propagate a constraint that creates a conflict and is echoed in comments using the object names in the current design.

You must propagate timing **gated_clock** checks before compilation if automatic clock

gating has been performed during elaboration.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example propagates only setup and hold time constraints, from all lower-level designs to the current design:

```
prompt> propagate_constraints -gate_clock
```

The following example propagates only **multicycle_path** exceptions from the *SUB1* subdesign to the current design:

```
prompt> propagate_constraints -design SUB1 -multicycle_path
```

The following example propagates clocks, exceptions, **gated_clock** checks, and **disable_timing** arcs to the current design from all instances of lower-level designs. The output is shown in non-verbose mode. Clock warnings are issued in this mode.

```
prompt> propagate_constraints -all
```

```

propagate_ilm

Propagates specified information of the interface logic model (ILM) blocks to the top-level design.

SYNTAX

```
status propagate_ilm
[-clock_mesh_annotation]
[-verbose]
[cell_list]
```

ARGUMENTS

-clock_mesh_annotation
Propagates clock mesh annotations from ILM to top-level. This option is used in the hierarchical clock-mesh flow using ILMs.

-verbose
Turn verbose messaging on.

cell_list
List of ILM blocks for which information must be propagated. Each cell in the list must be hierarchical ILM cell at any level in the logical hierarchy of the current design.

DESCRIPTION

This command propagates specified information for ILM blocks to the current design. Issuing the command without any options is considered as legacy style usage and interpreted as user intention to propagate keepout, placement, delay from ILMs. Since keepout, placement and delay information is auto-propagated, tool will not take any action in such a usage with no options specified.

The current design before executing this command must be the top design. This command links the current design before propagating the information.

-clock_mesh_annotation
Propagates clock mesh annotations from ILM to top-level. The clock mesh annotations are stored during block-level `clock_mesh` flow when `analyze_subcircuit` command is run. The same annotation is retained in the ILM during `create_ilm` command and is propagated to TOP level when this option is used. The clock mesh annotation data can be MCMM scenario specific. Therefore the `propagate_ilm` command is recommended to be run after activating required scenarios if the design has MCMM scenarios. Once propagated, the `clock_mesh` annotation gets stored in the top-level design when the design is saved to Milkyway. Subsequently, when the saved design is opened, the earlier propagated `clock_mesh` annotation will get restored. Therefore there is no need to run this command with this option after each time the design is opened. Refer to Hierarchical Clock Mesh related documentation in IC Compiler User Guide for further details on usage of this feature within the whole clock-mesh flow.

Multicorner-Multimode Support

This command uses information from active scenarios only.

propagate_switching_activity

Forces a propagation of the power switching activity information.

SYNTAX

```
int propagate_switching_activity
[-effort low | medium | high]
[-verbose]
[-infer_related_clocks]
```

ARGUMENTS

-effort low | medium | high

Specifies the effort level used during switching activity propagation. The tool uses more randomly generated switching activities to propagate the switching activity on higher effort levels. When this option is not specified, the value of the **power_sa_propagation_effort** variable is used as the effort level.

-verbose

Specifies that the switching activity mechanism is run in verbose mode, displaying displays more information and warning messages

-infer_related_clocks

Specifies that only related clock information is to be inferred. When this option is used, static probability and toggle rate information is not propagated; but related clock information is inferred for design objects that request a related clock.

DESCRIPTION

The **propagate_switching_activity** command forces a propagation of the power switching activity information.

During switching activity propagation, the information annotated using the **read_saif**, **set_switching_activity**, **merge_saif** commands is used to estimate the activity on unannotated nets. All commands that need switching activity information on all design objects use the switching activity propagation mechanism automatically. In most cases, you do not need to explicitly call the **propagate_switching_activity** command. The **propagate_switching_activity** command allows you to access propagated switching activity values directly without using a command such **report_power**, which propagates the switching activity as a side-effect.

The mechanism to propagate switching activity uses the static probability and toggle rate information you annotate to estimate the static probability and toggle rate information on unannotated design objects.

The mechanism used by the tool is based on a stochastic simulation method, which is that random activity based on the annotated switching activity is generated on the annotated design objects, and this activity is propagated across the design using a zero delay simulator. This is repeated for a few thousand times, depending on the

effort level.

The **-infer_related_clocks** option is used to restrict the action of the **propagate_switching_activity** command to inferring only the related clock information on design objects on which it was requested. Use the **-clock **** argument of the **set_switching_activity** command to specify that the related clock on the specified design object will be inferred automatically by the tool. Related clock information is inferred when commands that need switching activity information (such as **report_power**) are used. Use the command with the **-infer_related_clocks** option to infer only the related clock information. The related clock is placed in the **related_clock** attribute on the design objects.

The method in which the related clock information is described in the steps below.

First, the tool determines a starting set of inferred related clocks using the following rules:

- The inferred related clock on an object with a user set related clock, is the user set related clock.
- The inferred related clock on a clock source port or pin is the clock.
- If the **power_rclock_inputs_use_clocks_fanout** variable is set to **true**, then primary input nets that do not have an inferred related clock according to the rules above, then the following applies. If the transitive fanout of the input contains a clock network object, then the inferred related clock on the input is the clock driving the network. A clock network is the transitive fanout of a clock port or pin, stopping and including sequential cells. If more than one of this type of a clock object exists, then the fastest clock of this type is chosen as the related clock.

The related clocks are then inferred on design objects by the following rules:

- For flip-flop cells, if the **power_rclock_use_asynch_inputs** variable is set to **false**, then the inferred related clock on the cell's outputs is the inferred related clock on the cell's clock pin. If **power_rclock_use_asynch_inputs** is set to **true**, then the inferred related clock on the cell's outputs is the fastest inferred related clock on the cell's clock pin and the cell's asynchronous input pins.
- The inferred related clock on clock-gating cell outputs is the inferred related clock on the cell's clock input pin.
- For non-flip-flop and non-clock-gating cells, the inferred related clock on the cell's outputs is the fastest related clock on the cell's inputs.

The inferred related clocks are then made to be the design object's related clock for objects that requested a related clock. The inferred related clock information on design objects that did not request a related clock is discarded. For design objects that requested a related clock, but no clock was inferred by the above rules, the fastest design clock is set as the related clock if the **power_rclock_unrelated_use_fastest** variable is set to **true**.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example propagates the power switching activity information with high effort:

```
prompt> propagate_switching_activity -effort high
```

power_rclock_unrelated_use_fastest(3)
power_rclock_use_asynch_inputs(3)
```

psynopt

Performs incremental synthesis on the design.

SYNTAX

```
int psynopt
[-area_recovery]
[-only_area_recovery]
[-congestion]
[-no_design_rule | -only_design_rule]
[-only_hold_time]
[-in_place_size_only]
[-size_only]
[-on_route]
[-preserve_footprint]
[-use_annotation]
[-power]
[-only_power]
```

ARGUMENTS

-area_recovery

Enables area recovery for the cells not on the timing critical paths. By default, area recovery is not enabled.

-only_area_recovery

Specifies that only area recovery is performed. Timing optimizations and design rule checking are not performed. This option cannot be used with the **-only_design_rule** or the **-only_hold_time** option.

-congestion

Enables congestion removal algorithms for improved routability. By default, congestion is not enabled.

-no_design_rule | -only_design_rule

Specifies whether or not the tool fixes design rule violations before exiting. If **-no_design_rule** is specified, the tool exits before fixing design rule violations. You can check the results in a constraint report before fixing the violations. If **-only_design_rule** is specified, the tool performs only design rule fixing, and timing optimizations are not performed. The default is to perform both design rule fixing and timing optimizations before exiting.

The **-no_design_rule** and **-only_design_rule** options are mutually exclusive.

-only_hold_time

Specifies that only hold time violations are fixed. This option cannot be used with the **-no_design_rule** option. Use the **set_fix_hold** command to perform hold time fixing.

-in_place_size_only

Restricts optimization to sizing changes only. Optimization procedures that insert new cells and remove cells are disabled. With the **-in_place_size_only**

option, sizing changes are further constrained for minimal engineering change order (ECO) placement changes. For example, a cell is sized to improve timing or design rule costs only if the newly-sized cell can fit into any available space adjacent to the original cell location. The resulting transformation is verified to ensure it is legal.

The **-in_place_size_only** option is recommended for postroute flow, so optimization changes are constrained for minimal ECO changes. The **psynopt** command with the **-in_place_size_only** option is run as a final step after the design is finalized and legal, in order to provide extra quality of results (QoR) without causing significant ECO changes. Since the optimization on the entire design is highly constrained, significant QoR changes are not to be expected with **-in_place_size_only**.

-size_only

Restricts optimization to sizing changes only. Optimization tricks that insert new cells and remove cells are disabled. The **-size_only** and **-in_place_size_only** options are mutually exclusive. See the description for the **-in_place_size_only** option for additional information on how to constrain sizing changes more.

-on_route

Invokes the on-route optimization flow. RC extraction is performed automatically, if the design is not extracted. Optimization is restricted to sizing on free space and buffering on the existing route.

-preserve_footprint

Specifies to perform only footprint preserving sizing. Footprint preserving sizing is done by using footprint attribute added by vendors. When the tool sizes the cell, it checks the number of pins is the same, the name of pins is the same and the footprint attribute is the same as well as the size of the cell is the same. However, the tool does not check the physical pin location is the same and the tool assumes it is done by library vendor when it added footprint attribute.

-use_annotation

Invokes back annotation based optimization flow.

-power

Enables power optimization in **psynopt**. The type of power optimization will be determined by the command `set_power_options`. If the command `set_power_options` is not specified, then by default the tool will run leakage power optimization.

-only_power

Enables only power optimization in **psynopt**. The type of power optimization will be determined by the command `set_power_options`. If the command `set_power_options` is not specified, then by default the tool will run leakage power optimization.

DESCRIPTION

The **psynopt** command performs incremental preroute or postroute synthesis on the current design. The output of this command is a legally placed netlist.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example runs the **psynopt** command in preroute flow:

```
prompt> psynopt
```

create_placement(2)
legalize_placement(2)
place_opt(2)
set_power_options(2)
```

push_down_fp_objects

Transfers physical objects from the top level to the soft macro level.

SYNTAX

```
status push_down_fp_objects
[-object_type {routing | route_guides | blockages | cells | rows | shapes}]
[-cut_type push_down | cut_down | copy_down]
[-no_overlap_checking]
[-connect_copy_down_wires]
[-wire_net_type {pg | clock | signal}]
[-freeze_push_down_nets]
[-allow_feedthroughs]
[-nets net_object_list]
[-partial_overlap]
[-row_offset_x int]
[-row_offset_y int]
[-include all | shapes_with_net_id | shapes_without_net_id]
[soft_macros]
```

Data Types

<i>net_object_list</i>	collection or list
<i>soft_macros</i>	collection or list

ARGUMENTS

-object_type {routing | route_guides | blockages | cells | rows | shapes}
| shapes}" Specifies the types of object to be pushed down. You can specify more than one object type. If you do not specify this option, the default object type is routing.

The descriptions for the supported object types are as follows:

routing This object type includes wires, paths, vias and pins.
If a net is connected to these objects at the top level, but does not exist in the soft macro, child net will be created in the soft macro.

If a top level terminal is overlapped with soft macro, the terminal will be copied into child cell as a soft macro pin with the same shape of terminal.

For the case of pushing down PG nets in MIM design, if instances of MIMs are not aligned with MIM master instance, and they do not have PG rings around them, this command will leave gaps between the top level PG strap and the PG pin on such MIM instances (so that later PG routing could connect them).

route_guides This object type includes route guides and their corresponding attributes.

blockages This object type includes all blockages on metal blockage layers and soft or hard placement blockages.

cells	This object type includes all standard cells within the boundary of the specified soft macros that are marked as flip chip bumps or drivers. If a net is connected to these cells at the top level, but does not exist in the soft macro, the net is created in the soft macro.
rows	This object type includes all cell rows that touch the specified soft macros.
shapes	This object type includes all rectangular and rectilinear shapes that touch the specified soft macros on routing layers. Shape means metal segment here, and the rectangular placement blockage is handled as blockages object type. Wires, paths, vias and pins are handled as routing object type. If you specify shapes in -object_type , all rectangles and polygons with or without net id will be included.

-cut_type push_down | cut_down | copy_down
 Specifies how the command should process the pushed-down objects. If you do not specify this option, the **push_down** method is used. This option is a "one-of" type option and the specified option should be specified without using {} delimiters.

If you specify **push_down**, the tool creates a copy of the object in the soft macro and deletes the object from the top level. The tool also creates pins for routing objects where the routing object touches the soft macro boundary. This method applies to the following object types: routing, route_guides, blockages, and cells. For rows, **push_down** behaves the same as **copy_down**. The wires or paths passing through the soft macro area are removed from the parent cell and moved into the child cell. However, when the wires or paths are partially overlapped with the cell boundaries and the wire type is power/ground net, they are not removed from the parent cell, a copy will be created within child cell and pins will be created at edge of child cell boundary where copied wires/paths are ended at. If wires or paths are partially overlapped with the cell boundaries and the wire type is not power/ground net, push down will skip this net. If push down power/ground net and the net doesn't have connection with soft macro, push down will create a new input power/ground port on soft macro and create pin(s) for this new port. Push down processes tie high/low nets the same way as power/ground nets except it will skip those which have colinear overlap with child cell boundary.

If you specify **cut_down**, the tool creates pins for routing objects where the routing object touches the soft macro boundary and deletes the object from the top level. For routings, route_guides, blockages, and cells, **cut_down** behaves the same as **push_down**. For rows, **cut_down**

behaves the same as **copy_down**.

If you specify **copy_down**, the tool creates a copy of the object in the soft macro, but keeps the object in the top level. Unlike **push_down** and **cut_down**, the tool doesn't create pins for power and ground nets during **copy_down**

-no_overlap_checking

Push down the objects without checking for routing overlaps. This means that routing overlaps are ignored, even if they cause shorts. This option is only valid for routing object type.

-connect_copy_down_wires

Connect wires that are pushed down to their nets. This option should be used with -copy_down cut type. By default, -copy_down cut type doesn't connect the routings to the child net inside soft macro. For other cut type, push down will connect routings to their nets automatically. In addition, this option is only valid for routing object type and does not impact other object types.

-wire_net_type {pg | clock | signal}

Specifies what types of nets to process. You can specify more than one type of net. If you do not specify this option, pg (power, ground, tie high/low) nets and signal nets are processed.

Push down routing does not push down routes of signal nets which are colinear with the cell boundary. If you see the warning message of skipping the routes colinear with cell boundary, please re-route and possibly apply route guides to avoid routes going colinear with the boundaries.

This option is ignored if **routing** is not included in **-object_type**.

-freeze_push_down_nets

Sets the frozen attribute on the pushed down nets which have routing at the top level before pushing down. With this option, the router will not touch the routings that being pushed down.

This option is valid only for routing object type.

-allow_feedthroughs

This option is used only for signal/clock net and will be ignored for power/ground and tie high/low nets.

Specifies how the command should process physical routings. If this option is not specified, the command does not create new ports for feedthrough routings if the top level net has connection with the soft macro. If you do not specify this option and the soft macro has a port connected to the top level net, pins will be created at each

crossing points between soft macro boundary and physical routings. Multiple pins may be created for one port on the soft macro level. It does not create new net on the top level for the routing connections between soft macros. If you specify this option, the command will create new ports for feedthrough routings and create new net at top level for the split net.

This option is effective only for routing object.

-nets *net_object_list*

Specifies the nets whose associated routing objects (wires, paths, vias, via arrays...) are to be pushed down.

If you do not specify this argument, the command processes all nets whose associated routing objects are spatially coincident with soft macros in the current design.

-partial_overlap

Pushes down cells which partially overlap the soft macro boundary.

By default, only those cells that are completely within the soft macro boundary are pushed down. In flip chip design, if this option is not specified and the flip chip cells have overlap with soft macro, routing blockages will be created for overlapped flip chip pins.

This option is ignored if **cells** is not included in **-object_type**.

-row_offset_x *int*

Specifies the horizontal offset between the soft macro core and rows.

The default is 0. This option is valid only for "rows" object type.

-row_offset_y *int*

Specifies the vertical offset between the soft macro core and rows.

The default is 0. This option is valid only for "rows" object type.

-include *all | shapes_with_net_id | shapes_without_net_id*

Specifies what type of shapes this command should process. If you specify **-include shapes_with_net_id**, only shapes connected to net will be processed; If you specify **-include shapes_without_net_id**, only shapes not on any net will be processed. The default value of this option is **all**, which means both shapes with and without net id are processed.

This option is valid only when **shapes** is included in **-object_type**.

soft_macros

Specifies the soft macros into which to push down the specified objects.

push_down_fp_objects

If you do not specify this argument, the command processes all soft macros in the current design.

DESCRIPTION

This command transfers physical objects from the top level to the soft macro level.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example pushes down routing and cell objects for all soft macros in the current design. Wires that are pushed down are connected to their nets.

```
prompt> push_down_fp_objects -object_type {routing cells}
```

The following example pushes down "VDD" routing for all soft macros in the current design. Wires that are pushed down are connected to "VDD" nets in the soft macros.

```
prompt> push_down_fp_objects -object_type {routing} \
   -wire_net_type pg -nets [get_nets VDD]
```

SEE ALSO

`push_up_fp_objects(2)`

push_flip_chip_route

Pushes routed flip-chip wires either in a specified direction or away from the specified nets.

SYNTAX

```
status push_flip_chip_route
-nets collection_of_nets
  | -nets_in_file nets_file
[-layer mX | MX | tech_layer_number]
[-direction up | down | left | right]
[-mode 1 | 2 | 3]
[-sweep_range sweep_range]
[-all]
```

Data Types

<i>collection_of_nets</i>	collection
<i>nets_file</i>	string
<i>sweep_range</i>	integer

DATA TYPES

<i>collection_of_nets</i>	collection
<i>nets_file</i>	string
<i>tech_layer_number</i>	integer
<i>number</i>	integer
<i>sweep_range</i>	integer
<i>mX</i>	string
<i>MX</i>	string

ARGUMENTS

-nets *collection_of_nets*
Specifies the flip-chip nets to be pushed when using modes 1 or 2. For mode 3, this option specifies the nets to push routed wires away from.
The **-net**, **-nets_in_file** options are mutually exclusive. You must specify one of these options.

-nets_in_file *nets_file*
Specifies the name of a file that contains the flip-chip nets to be pushed when using modes 1 or 2. For mode 3, this option specifies the nets to push routed wires away from.
The **-net**, **-nets_in_file** options are mutually exclusive. You must specify one of these options.

-layer mX | MX | tech_layer_number
Specifies the metal layer on which to push the specified flip-chip wires. You can specify only a single metal layer. (m1 to m15) You specify the metal layer by using its technology file layer number or m1 to m15.

By default, the tool pushes the wires on the top metal layer.

-direction up | down | left | right

Specifies the direction in which to push the flip-chip nets.

If you do not specify the direction, the tool does not push any wires.

-mode 1 | 2 | 3

Specifies the mode in which to push the flip-chip nets. The meanings for each mode are

* Mode 1 (default mode)

Pushes the flip-chip nets in the specified direction.

A wire is pushed until it is totally blocked by a routing obstruction (a metal blockage or wire) or it meets the bounding box of the target routed net. When a wire is blocked, the tool splits the wire and tries to push parts of the wire. For example, assume that a vertical wire A is being pushed to the right, as shown in Figure 1, but blockage B partially blocks the way. When the tool finishes pushing the wire, wire A is split into 3 parts: vertical wire A1, horizontal wire C, and vertical wire A2, as shown in Figure 2.

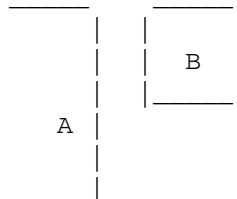

Figure 1

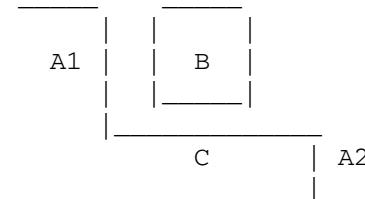

Figure 2

When pushing wires, the tool respects the spacing requirements defined by **set_route_flip_chip_options -layer_spacing**. The

The net length of the pushed net should be less than or equal to the original net length.

* Mode 2

Pushes the nets as described in mode 1, but does not push the segment inside of I/O driver cells.

* Mode 3

Pushes the nearest $2 \times N$ nets away from a specific net, where N is specified in the **-sweep_range** option.

Use mode 3 to push the neighboring wires away from an open net so that the net can be routed.

-sweep_range *sweep_range*

Specifies the sweep range value used with mode 3. The default is 10.

DESCRIPTION

This command provides several modes to manually push routed flip-chip wires.

A flip-chip net is a net that connects a flip-chip driver I/O cell to a bump cell

(which is also called a flip-chip pad). You can write the flip-chip nets to a file by using the **write_flip_chip_nets** command.

When the tool pushes a wire, it moves the wire in a certain direction until it is blocked by other obstacles, respecting the spacing requirements defined by **set_route_flip_chip_options -layer_spacing**. The wires remain on their original metal layer and the connectivity is not changed.

EXAMPLES

The following command pushes flip-chip nets NET1 and NET2 on metal layer 57 up using mode 2.

```
prompt> push_flip_chip_route -layer 57 -mode 2 \
-nets {NET1, NET2} -direction up
```

The following command pushes 40 neighboring nets sway from flip-chip net NET3.

```
prompt> push_flip_chip_route -layer m9 -mode 3 \
-nets NET3 -sweep_range 20
```

push_up_fp_objects

Transfers physical objects from the soft macro level to the top level.

SYNTAX

```
status push_up_fp_objects
[-object_type {routing | pins | route_guides | blockages | cells | rows}]
[-layers layer_object_list]
[-to_object_type routing | terminals]
[-top_level_interface_nets net_object_list]
[-preserve_child_preroutes]
[-include pushed_down_objects_only | all]
[-child_object_names object_list]
[soft_macros]
[-ignore_not_push_down_nets]
```

Data Types

<i>net_object_list</i>	collection
<i>object_list</i>	collection
<i>soft_macros</i>	collection

ARGUMENTS

-object_type {routing | pins | route_guides | blockages | cells | rows}
Specifies the types of object to be pushed up. You can specify more than one object type. If you do not specify this option, the default object type is routing.
The descriptions for the supported object types are as follows:
routing This object type includes wires, paths, and vias.
pins This object includes soft and hard macro pins.
route_guides This object type includes route guides and their corresponding attributes.
blockages This object type includes all blockages on metal blockage layers and soft or hard placement blockages.
cells This object type includes all standard cells within the boundary of the specified soft macros.
rows This object type includes all cell rows that touch the specified soft macros.
Rows are not pushed up to the top level (the top level already contains the row objects), they are just removed from the soft macros.

-layers *layer_object_list*
Limits the objects that are pushed up to specific layers.
Use this option with routing or pin objects only.

-to_object_type *routing | terminals*
Specifies the type for objects after they are pushed up to the top level from soft macros. You should use this option when pushing up soft or hard macro pins or routings only.

You can push up soft or hard macro pins from the soft macro to the top level as wire routing or as top-level terminals.

You can push up child-level routing to top-level routing or to top-level terminals if there are top-level ports on the connected top-level nets. If the child-level routing is pushed up to top-level terminals and the routing is rectilinear, the pushed-up routing is broken into rectangular electrically equivalent (EEQ) pins.

Here is a description of the supported object types.

routing This object type includes wires, paths, and vias.

terminals This object includes top-level terminals.

-top_level_interface_nets *net_object_list*
Specifies a collection of top-level interface nets for which routing or pin objects are pushed up. Only child objects with logical connections to those top-level nets are pushed up.

-preserve_child_preroutes

Do not delete routing objects from the soft macro after creating them at the top level. You should use this option used when pushing up routings

.

-include *pushed_down_objects_only | all*

Specifies the objects to be pushed up. This option applies only to cells, nets, and routing objects. By default (**pushed_down_objects_only**), only the object types that were created from the **push_down_fp_objects** command are pushed up to the top level. If you specify **all**, the object types that are created solely inside soft macros are also pushed up.

This option is ignored for route guides, blockages, and row object types. For these object types, the command always pushes up both previously pushed down objects and objects that are created solely inside soft macros.

-child_object_names *object_list*

Specifies the objects inside soft macros to push up.

The object names must be full hierarchical names. They can be cell instance names or net names.

soft_macros

Specifies the soft macros from which to push up objects.

push_up_fp_objects

If you do not specify this argument, objects are pushed up from all soft macros in the current design.

DESCRIPTION

This command transfers physical objects from the soft macro level to the top level.

Any netlist connections made by the **fp_push_down_objects** command are deleted by this command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example pushes up routing and cell objects for all soft macros in the current design.

```
prompt> push_up_fp_objects -object_type {routing cells}
```

SEE ALSO

[push_down_fp_objects\(2\)](#)

pwd

Displays the pathname of the present working directory (pwd), also called the current directory.

SYNTAX

string **pwd**

ARGUMENTS

None

DESCRIPTION

Displays the pathname of the current directory. The directory from which you invoke the Design Analyzer or dc_shell is the initial current directory.

A file specification of dot (.) is shorthand for the current directory. Dot is commonly included in the **search_path** variable.

Use the **cd** command to change the current directory. Note that changing the current directory in the Design Analyzer does *not* affect the current directory of the UNIX shell from which you invoked the Design Analyzer.

EXAMPLES

```
prompt> pwd
/usr/designer/joe
```

SEE ALSO

[cd\(2\)](#)
[search_path\(3\)](#)

query_objects

Searches for and displays objects in the database.

SYNTAX

```
string query_objects
[-verbose]
[-class class_name]
[-truncate elem_count]
object_spec
```

Data Types

<i>class_name</i>	string
<i>elem_count</i>	int
<i>object_spec</i>	list

ARGUMENTS

-verbose

Displays the class of each object found. By default, only the name of each object is listed. With this option, each object name is preceded by its class, as in "cell:U1/U3".

-class *class_name*

Establishes the class for a named element in the *object_spec*. Valid classes are design, cell, net, and so on.

-truncate *elem_count*

Truncates display to *elem_count* elements. By default, up to 100 elements display. To see more or less elements, use this option. To see all elements, set *elem_count* to 0.

object_spec

Provides a list of objects to find and display. Each element in the list is either a collection or an object name. Object names are explicitly searched for in the database with class *class_name*.

DESCRIPTION

The **query_objects** command (a simple interface) finds and displays objects in the runtime database of Design Compiler. The command does not have a meaningful return value; it simply displays the objects found and returns the empty string.

The *object_spec* is a list containing collection handles or object names. For elements of the *object_spec* that are collection handles, **query_objects** simply displays the contents of the collection.

For elements of the *object_spec* that are names (or wildcarded patterns), **query_objects** searches for the objects in the class specified by *class_name*. Note that **query_objects** does not have a predefined, implicit order of classes for which searches are initiated. If you do not specify *class_name*, only those elements that are collection handles display. Messages display for the other elements (see

EXAMPLES).

To control the number of elements displayed, use the `-truncate` option. If the display is truncated, you see the elipsis (...) as the last element. Note that if the default truncation occurs, a message displays showing the total number of elements that would have displayed (see EXAMPLES).

NOTE: For those of you familiar with the dc_shell `find` command, the `query_objects` command covers part of the functionality of `find`. The output from `query_objects` looks similar to the output of `find`, but remember that the result of `query_objects` is always the empty string.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

These following examples show the basic usage of `query_objects`.

```
prompt> query_objects [get_cells o*]
{"or1", "or2", "or3"}
prompt> query_objects -class cell U*
 {"U1", "U2"}
prompt> query_objects -verbose -class cell \
    [list U* [get_nets n1]]
 {"cell:U1", "cell:U2", "net:n1"}
```

When you omit the `-class` option, only those elements of the `object_spec` that are collections generate output. The other elements generate error messages.

```
prompt> query_objects [list U* [get_nets n1] n*]
Error: No such collection 'U*' (SEL-001)
Error: No such collection 'n*' (SEL-001)
 {"n1"}
```

When the output is truncated, you get the elipsis at the end of the display. For the following example, assume the default truncation is 5 (it is actually 100).

```
prompt> query_objects [get_cells o*] -truncate 2
 {"or1", "or2", ...}
prompt> query_objects [get_cells *]
 {"or1", "or2", "or3", "U1", "U2", ...}
Output truncated (total objects 126)
```

SEE ALSO

get_ports(2)
get_timing_paths(2)
```

quit

Exits the shell.

SYNTAX

string **quit**

ARGUMENTS

None.

DESCRIPTION

This command exits from the application. It is basically a synonym for **exit** with no arguments.

EXAMPLES

The following example exits the current session.

```
prompt> quit
```

SEE ALSO

exit(2)

read_antennaViolation

The command is used to read antenna violation file to ICC.

SYNTAX

```
int read_antennaViolation
[-format hercules]
[-file file_name]
```

ARGUMENTS

-format *hercules*
Specifies the antenna violation file format.

-file *file_name*
Specifies the antenna violation file name.

DESCRIPTION

This command is used to read antenna violation file. The `insert_diode` and `connect_spare_diode` command may use this information.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of the `read_antennaViolation` command.

```
prompt> read_antennaViolation \
-format Hercules -file antenna.rpt
```

The following is an example of the input file.

```
C 272.799988 128.000000 METAL METAL 77.773973 0.350400 4
```

SEE ALSO

`insert_diode(2)`
`connect_spare_diode(2)`

read_ddc

Reads in one or more design files in .ddc (Synopsys logical database) format.

SYNTAX

```
status read_ddc
file_names
[-scenarios scenario_list]
[-active_scenarios active_scenario_list]
```

Data Types

<i>file_names</i>	list
<i>scenario_list</i>	list
<i>active_scenario_list</i>	list

ARGUMENTS

file_names

Specifies the names of one or more files to be read. If specifying more than one file name, enclose the names in braces ({}).

-scenarios scenario_list

Specifies a list of scenarios whose constraints should be read from the .ddc file. For complete information on this option see the man page for the **read_file** command.

-active_scenarios active_scenario_list

Specifies a list of scenarios that should be made active as the file is read. For complete information on this option see the man page for the **read_file** command.

DESCRIPTION

The **read_ddc** command reads design information from the Synopsys logical database (.ddc) files into **dc_shell**.

This command is derived from **read_file -format ddc**. For more information, see the man page for the **read_file** command.

Multicorner-Multimode Support

This command uses information from both active and inactive scenarios.

SEE ALSO

read_file(2)

read_def

Annotates the design with the data from a file in Design Exchange Format (DEF).

SYNTAX

```
status read_def
[-check_only]
[-enforce_scaling]
[-no_incremental]
[-verbose]
[-turn_via_to_inst]
[-inexactly_matched_via_to_inst]
[-lef lef_file_names]
[-snet_no_shape_as_user_enter]
[-snet_no_shape_as_detail_route]
[-preserve_wire_ends]
def_file_names
```

Data Types

<i>lef_file_names</i>	list
<i>def_file_names</i>	list

ARGUMENTS

-check_only
Turn on `read_def` `check_only` mode. `check_only` mode is used to analyze the input DEF file before doing real object annotation, and to give diagnostic information on the correctness and integrity of DEF file. `check_only` mode does not annotate any DEF information into the Milkyway.

-enforce_scaling
Instructs the tool to continue to annotating information given in the DEF input regarding of possible roundoff errors due to unit conversion.

-no_incremental
Specifies that all pre-existing physical annotations will be removed, and the physical information in the DEF file will be read in.

-verbose
Enables the printing of additional debugging messages of two types: those that contain information and those that contain warnings. The **-quiet** and **-verbose** options are mutually exclusive; you should use only one. If you specify both options, the tool honors **-verbose**.

-turn_via_to_inst
Specifies that turn vias are created as via cell instances. Turn vias are represented in DEF as a single rectangle (usually a piece of dangling metal). By default, turn vias are created as path objects.

-inexactly_matched_via_to_inst
Specifies that inexactly matched vias are created as via cell instances.

Inexactly matched vias are vias which match a Milkyway technology contact code's cut dimensions, but the enclosure dimensions are larger than the contact code's enclosure dimensions. By default, inexactly matched vias are created as contact arrays and extra paths on the enclosure layers.

-lef lef_file_names

Specifies to import the rotated vias and design-specific nondefault rules from the LEF files into the design. The incremental LEF files are generated by the **write_def** command.

-snet_no_shape_as_user_enter

Marks the wire segments without "+ SHAPE" statement in special nets with the route type "user enter".

-snet_no_shape_as_detail_route

Marks the wire segments without "+ SHAPE" statement in special nets with the route type "detail route".

-preserve_wire_ends

Indicates that special power/ground wiring should be created as paths without extensions (that is, square ends), special fill wiring should be created as rectangles, and all other special and regular wiring should be created as wires with half-width extensions (that is, square ends by half-width).

def_file_names

Specifies the name of the file from which to draw physical data to annotate onto the design. This file must be in Design Exchange Format (DEF). For multiple files, the def files are read in as incremental mode, and you must specify the def files in the right order. It strongly recommended that you remove overlapping floorplanning data, such as ROWS, and duplicate routing geometry data in the DEF files. These conditions might be error prone in the subsequent flow.

DESCRIPTION

This command annotates the design with physical design data taken from a file in Design Exchange Format (DEF). The command can read either an uncompressed or compressed (in gzip format) DEF file.

The command reads physical data associated with the current design from a DEF file. If cell, port, or net specified in the DEF file do not exist in the database, they will be created as the corresponding object in Milkyway.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In the following example, the design is annotated with the physical data defined in the file named top.def.

```
prompt> read_def top.def
```

SEE ALSO

`write_def(2)`

read_drc_error_file

Creates an error cell from the given drc error file.

SYNTAX

```
status read_drc_error_file
[-drc_type type]
[-error_cell cell_name]
drc_file
```

Data Types

<i>type</i>	string
<i>cell_name</i>	string
<i>drc_file</i>	string

ARGUMENTS

-drc_type *type*

Type of the *drc_file*. Valid values are: *calibre*. If this option is not specified, the default type is "calibre".

-error_cell *cell_name*

Name to assign the error cell.

For *calibre* drc report, if this option is not specified, <*cell_name*>.err is used by default, where <*cell_name*> is found inside the drc report file.

If this option is not specified and <*cell_name*> is not found, this command will abort.

drc_file

The DRC error report to read in.

DESCRIPTION

read_drc_error_file takes a drc error report as input and creates an error cell. The error cell can then be loaded with the error browser.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of how to run **read_drc_error_file** command.

```
prompt> read_drc_error_file drc_report
```

SEE ALSO

`report_error_coordinates(2)`

read_file

Reads designs or libraries into memory, or reads libraries into the shell.

SYNTAX

```
list read_file
file_list
[-format format_name]
[-ilm]
[-single_file single_file_name]
[-scenarios scenario_list]
[-active_scenarios active_scenario_list]
```

Data Types

file_list	list
format_name	string
single_file_name	string
scenario_list	list
active_scenario_list	list

SYNTAX for lc_shell

ARGUMENTS

```
file_list
    Specifies a list of files to read. When specifying more than one input_file,
    enclose the list of names in braces ({}).

-format format_name
    Specifies the format in which a design is read. The format_name can be one
    of the following formats:
        Format Description
        ddc      Synopsys internal database format (default)
        db       Synopsys internal database format
        equation  Synopsys equation format
        pla      Berkeley (Espresso) PLA format
        st       Synopsys State Table format

-ilm
    Reads from the Milkyway ILM (interface logic model) view.

-single_file single_file_name
    Puts the designs in the file_list option into the single internal design file
    specified by single_file_name, regardless of the input format.

-scenarios scenario_list
    Specifies a list of scenarios whose constraints should be read from the .ddc
    file. Constraints for any scenarios that are not listed are not read, which
    may save memory and time if the file is large and certain scenarios are not
    required in the current session. If this option is not used then all scenarios
```

will be read from the file. This option may only be used with the .ddc format.

-active_scenarios active_scenario_list

Specifies a list of scenarios that should be made active as the file is read. Any scenarios that are not listed will be restored in the inactive state. This option must be used in conjunction with the **-scenarios** option and may contain only scenarios that are listed in **-scenarios scenario_list**. If the **-active_scenarios** option is not used then the active or inactive state of the scenarios will be restored according to the state that was recorded when the file was written (unless the scenarios already exist). This option may only be used with the .ddc format.

DESCRIPTION

This command reads the designs in *file_list* into memory. The current design is automatically set to the first design that is read. The **read_file** command also can read the libraries in *file_list* into the shell.

While it is good practice to always specify the **-format** option, if **-format** is not specified then the tool will attempt to infer the format based on the file name extensions, if any. The recognized extensions are .ddc (ddc); .db, .pdb, .sdb, .sldb (db); .v or .verilog (verilog); .sv or .sverilog (sverilog); .vhd or .vhdl (vhdl). Extensions are not case-sensitive. If the file name ends in .gz then the preceding extension, if any, is used -- e.g., an extension of .v.gz is recognized as verilog format. (The .gz extension is not supported for ddc files.) If multiple files are specified on the same command line then their formats must all be the same. If the format cannot be inferred from the file names then the default format, ddc, is used.

Internally, designs are stored in design files. An internal design file is a "container" of designs and has a complete, unique, UNIX-type filename associated with it. The designs in a design file also have unique names, but designs with the same name can exist in different design files. For information about displaying design files and their contents, see the **list_designs** man page.

By default, when the tool reads files in a format other than .ddc or .db, it places each design in its own internal design file named in the *input_file_path/design_name.ddc* format. The names of files read in .db or .ddc format remain the same.

When the tool reads an HDL parameterized design file, the design is not converted to a .ddc file, but instead is parsed and stored in an intermediate format. You then can build the design by using the **elaborate** command or by instantiating the design in another HDL design.

Because internal database files at lower levels of hierarchy are automatically read when they are linked, you do not need to read them separately. Designs are not automatically linked at the time they are read. You can use the **link** command after the **read_file** command to ensure that referenced designs are read correctly. For information on automatic loading, see the **link** man page.

Internally, libraries are stored in library files. An internal library file is a "container" of libraries and has a complete, unique, UNIX-type filename associated with it. The libraries in a library library file also have unique names, but libraries with the same name can exist in different library files. For information

about displaying library files and their contents, see the **list_libs** man page.

By default, when the tool reads non-database format files, each library is placed in its own internal library file named in the *input_file_path/file_name.db:library_name* format. The names of files read in .db format remain the same.

An input file can have either a simple or a complex filename. A simple filename has no directory specification, which means (in UNIX) that it does not contain a / (slash). Simple filenames such as adder.ddc or library.db must be found in a directory listed in the **search_path** variable. A complex filename has a directory specification in it, which means that it does contain one or more slashes. Complex filenames such as ./test.ddc, ../test.ddc, or ~john/test/test.ddc are not searched for in the **search_path**.

Multicorner-Multimode Support

This command supports an option to specify which active scenarios it should work with.

EXAMPLES

The following example uses simple and complex filenames to read in a file of equations. This is a complex path specification, so **search_path** is not used.

```
prompt> read_file -format equation ~bill/dc/test/test.fnc
Loading file '/usr/bill/dc/test/test.fnc'
test
```

The following example uses a simple file name to specify the same file as shown in the example above. Thus, its directory must appear in the **search_path**.

```
prompt> search_path = {~bill/dc/test}
~bill/dc/test
prompt> read_file -format equation test.fnc
Loading file '/usr/bill/dc/test/test.fnc'
test
```

The following example uses simple and complex filenames to read the library. This is a complex path specification, so the **search_path** is not used.

```
prompt> read_file ~bill/dc/test/test.db
Loading db file '/usr/bill/dc/test/test.db'
{test}
```

The following example shows that in order to specify the same file as shown in the example above as a simple filename, its directory must appear in the **search_path**.

```
prompt> search_path = {~bill/lc/test}
{~bill/lc/test}
```

```
prompt> read_file test.db
Loading db file '/usr/bill/lc/test/test.db'
{test}
```

read_flip_chip_bumps

Reads bump locations and connected nets from a file with the advanced input format (AIF).

SYNTAX

```
status read_flip_chip_bumps
-physical_lib_cell {phy_lib_cels}
[-orientation N | W | S | E | FN | FE | FS | FW]
file_name
```

Data Types

<i>phy_lib_cels</i>	collection
<i>file_name</i>	string

ARGUMENTS

```
-physical_lib_cell {phy_lib_cels}
    Specify a collection of physical library cells. The collection must contain
    one cell whose location serves as the reference point from which the flip-
    chip bump cells are placed in the die area.

-orientation N | W | S | E | FN | FE | FS | FW
    Specifies the orientation of the bump cells. The default is N.

file_name
    Specifies the name of the input file. The format of the file must be AIF.
```

DESCRIPTION

This command reads bump locations and net connections from a text file in the AIF format. The file can be specified with a relative or absolute path. The tool reads the bump locations and connected nets from the [NETLIST] section of the file even though the file might contain other unrelated data. The coordinates of the bump cells are referencing to the center of the die. The die size in the file is taken into account when calculating its coordinates referencing the lower-left corner.

The following is an example of AIF file.

```

```

Descriptions:

[DATABASE]

Identifies the file as an AIF file and contains the version and units of the coordinates.

[DIE]

Describes the width and height of the die and a name for the die. Width is measured along the horizontal X axis and height is measured along the vertical Y axis. The width and height are defined per die nominal described dimensions.

[PADS]

The PADS section defines all pad types needed for the die.

[NETLIST]

Defines each net and the coordinates of each die pad. Each column must have an entry. If a particular data item is not present, you must use a hyphen as a placeholder.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reads bump locations and net connections from file bump_loc.

```
prompt> read_flip_chip_bumps -  
physical_lib_cel [get_physical_lib_cells "BUMP"] .../scripts/bump_loc
```

SEE ALSO

```
write_flip_chip_bumps(2)  
place_flip_chip_array(2)  
expand_flip_chip_cell_locations(2)
```

read_floorplan

Reads in a script that describes a floorplan into current Milkyway cel.

SYNTAX

```
int read_floorplan
file_name [-echo]
```

Data Types

file_name string

ARGUMENTS

file_name Specifies the name of the file that contains the floorplan script to be read.
-echo Indicates that each command is to be echoed as it is executed.

DESCRIPTION

The **read_floorplan** command reads in a script file, which contains commands describing floorplan information.

Like **source**, the **read_floorplan** command is sensitive to variables that control script execution (for example, **sh_continue_on_error** and **sh_script_stop_severity**). The **read_floorplan** command uses **sh_source_uses_search_path** to determine if **search_path** is used to find the script.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reads the floorplan script **top.fp**.

```
prompt> read_floorplan top.fp
```

```
Reading floorplan ...
1
```

SEE ALSO

```
source(2)
write_floorplan(2)
search_path(3)
sh_continue_on_error(3)
sh_script_stop_severity(3)
sh_source_uses_search_path(3)
```

read_io_constraints

Reads I/O constraints into the specified design.

SYNTAX

```
status read_io_constraints
[-append]
[-cell name]
io_constraints_file
```

Data Types

<i>name</i>	string
<i>io_constraints_file</i>	string

ARGUMENTS

-append

Appends the I/O constraints to the current Milkyway cell. By default, the command overwrites the existing I/O constraints.

-cell *name*

Specifies the name of the Milkyway cell or plan group into which the I/O constraints are read. If you do not specify this option, the constraints are read into the current Milkyway cell.

io_constraints_file

Specifies the name of the file that contains the Tcl commands of the **set_pin_physical_constraints** **set_pad_physical_constraints** and **set_chiplevel_pad_physical_constraints** commands.

In this file, the **set_pin_physical_constraints** and **set_pad_physical_constraints** commands must be in the following formats:
`set_pin_physical_constraints -pin_name ... set_pad_physical_constraints -pad_name ...`

Neither **-cell name** nor **object** should appear in these two commands.

DESCRIPTION

Reads the I/O constraints defined in the *io_constraints_file* into the current Milkyway cell.

I/O constraints are used for pad and terminal placement during the floorplan stage.

By default, a Milkyway cell is required to be open before reading the I/O constraints. If no Milkyway cell is open, you can use the **open_mw_cel** command to open one. The **current_mw_cel** command can be used to set an open Milkyway cell as the current Milkyway cell.

If you want to append any constraints, you must use the **-append** option. For example, if there are physical constraints for pin A in the current cell, but there is no pin A constraints entry in *io_constraints_file*, the physical constraints of pin A will

be erased if the `read_io_constraints` `io_constraints_file` is used.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In the following example, an I/O constraint file is read into the current Milkyway cell and the existing I/O constraint is overwritten.

```
prompt> read_io_constraints top.tcl
1
```

To load I/O constraints in incremental mode, the `-append` option is specified.

```
prompt> read_io_constraints -append top_1.tcl
1
```

```

read_lib

Reads a technology library, physical library, or symbol library into the shell.
Creates a physical library for GDSII.

SYNTAX

```
int read_lib
[-format format_name]
[-symbol intermediate_symbol_library_file]
[-plib physical_library_output_file]
[-pplib pseudo_physical_file_name]
file_name
[-no_warnings]
[-names_file file_list]
[-test_model CTL_file_list]
[-html]
[-lib_message_var_name lib_msg_var_name]
```

Data Types

<i>format_name</i>	string
<i>intermediate_symbol_library_file</i>	string
<i>physical_library_output_file</i>	string
<i>pseudo_physical_file_name</i>	string
<i>file_name</i>	string
<i>file_list</i>	list
<i>CTL_file_list</i>	list

ARGUMENTS

-format *format_name*
Specifies the name of the external format of the specified symbol library.
Use this option if you want to specify EDIF/GDSII format; the default is
Synopsys Library Compiler format. If the format is GDSII, the **read_lib**
command creates a physical library file.

-symbol *intermediate_symbol_library_file*
Specifies the name of a symbol library file to be created in Synopsys library
format. This option is used with EDIF symbol library description files and
in conjunction with the **-format EDIF** option.

-plib *physical_library_output_file*
Specifies the name of the intermediate pseudo-physical library file, which
is generated from GDSII. This file is also read into the tool for generating
a memory database. It is used with the GDSII physical library file and in
conjunction with the **-format GDSII** option of GDSII.

-pplib *pseudo_physical_file_name*
Specifies the name of the technology file, as given out by the vendor. This
file should be in the pseudo-library format for the tool to read technology-
specific information. It is used with the GDSII physical library file and in
conjunction with the **-format GDSII** option of GDSII.

file_name
 Specifies the name of the library file to be read. A technology or physical library must be in Synopsys Library Compiler format. A symbol library might be in either Synopsys Library Compiler format or EDIF format. If it is in GDSII format, the file name should be *gdsii* file.

-no_warnings
 Specifies that all messages of severity 'warning' are to be suppressed. By default, all messages are issued. Warning messages can identify serious library problems; use this flag sparingly.

-names_file file_list
 Specifies a set of one or more name-mapping files when this option is used in conjunction with the **-format edif** option. Design Compiler's EDIF reader uses this set of files to change the names of symbols or symbol pins in the incoming EDIF files (*file_name*) to resolve name-based consistency issues. If these files are required, you must create them before executing the **read_lib** command. When specifying more than one name-mapping file, enclose them in braces ({}).

-test_model CTL_file_list
 Specifies a set of one or more CTL files as test model of cells in the library. The format of the CTL_file_list is <cell_name:>file_name where cell_name is optional and is to specify the particular cell a CTL file models. When the cell_name is missing, the environment name in the CTL file is used as the cell name it is modelling. When specifying more than one CTL file, enclose them in braces ({}).

-html
 Specifies that library screener results are reported in html.

DESCRIPTION

Reads a library file into the shell (or GUI). The library file is automatically compiled by the Synopsys Library Compiler.

This command is also used to extract the geometries from GDSII files.

Technology specific information to extract GDSII files should be in Synopsys pseudo-library format.

The **names_file** option enables you to change the names of symbol and symbol pins. The general format of the name-mapping files is the same for the **read_lib** command as it is for the **change_names** command. The object types for the **read_lib** command are **reference** or **component** (to change symbol names), and **pin** (to change symbol pin names).

The library specified in *file_name* can have either a simple or complex filename. A simple filename has no directory specification, which means (in UNIX) that it does not contain a "/" (slash). Simple filenames such as *test.lib* or *library.db* must be found in a directory listed in the **search_path** variable. A complex filename has a directory specification in it, which means that it does contain a slash. Complex filenames such as *./test.lib* or *~synopsys/dc/test.lib* are not searched for in **search_path**.

You can read any number of libraries into the shell. Two libraries can have the same name in the system as long as they are read from different sources. The command **list_libs** shows all the libraries present in the system.

For details on library file syntax, see *Library Compiler Reference Manual*. Function statements and state information are ignored when reading technology library files if you do not have a Library Compiler license. You do not need a license to read symbol library files.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In the following example, the library file "tech_lib.lib", which contains technology information in Synopsys technology library entry format, is read. The **-no_warnings** flag causes all Library Compiler warning messages to be suppressed.

```
prompt> read_lib ~synopsys/libraries/tech_lib.lib -no_warnings
```

The following example reads a symbol library in EDIF format. It also specifies that a library file named *sym_lib.sdb* be created in Synopsys symbol library entry format.

```
prompt> read_lib sym_lib.edif -format EDIF -symbol sym_lib.slib
```

The following example shows a name-mapping file called lib.names and its usage:

Design	Type	Old Name	New Name
lib	reference	NR2	nr2
NR2	pin A	a	
NR2	pin B	b	
NR2	pin Z	z	
lib	reference	HO22	aoi2
HO22	pin I1	a	
HO22	pin I2	b	
HO22	pin I3	c	
HO22	pin O1	z	

```
prompt> read_lib foo.edif -format EDIF -names_file lib.names \
-symbol foo.slib
```

The following example reads a list of GDSII files names *foo1* and *foo2*, and a technology file named *barplib* and generates an intermediate pseudo-plib file named *fooplib*. The *foolib*, which contains technology information in Synopsys technology library entry format, is read.

```
prompt> read_lib -format gdsii -plib foo -plib barplib \
{foo1.gdsii foo2.gdsii}
```

The following example reads a library file as well as a CTL file when **-test_model** option is used.

```
prompt> read_lib bar.lib -test_model {foo1.ctl foo2:foo2.ctl}
```

The following example reads a library file and report screener messages in html.

```
prompt> read_lib bar.lib -html
```

`compare_lib(2)`
`list_libs(2)`
`write_lib(2)`
`search_path(3)`

read_mw_eco_list

Reads an ECO change file and performs ECO operations on Milkyway designs.

SYNTAX

```
status read_mw_eco_list
[designcell_name]
[-library lib_name]
[-change_file change_filename]
[-explicit_uniq]
[-loose_name_match]
[-softmacro]
```

Data Types

<i>designcell_name</i>	string
<i>lib_name</i>	string
<i>change_filename</i>	string

ARGUMENTS

designcell_name

The name of Milkyway design cell that will be changed. If not specified, the current design will be used. Make sure the design cell should be opened first before running this command.

NOTE: The hierarchy preservation data and the flat design data of the cell need to be consistent.

-library *lib_name*

The name of Milkyway Library in which the design cell stores. If not specified, the current edited library will be used, or TCL variable *mw_design_library* will be used.

-change_file *change_filename*

The file name of Milkyway ECO change file. The file shall be hierarchy ECO change file for hierarchy ECO. **NOTE:** Syntax error in the change file will make Milkyway ECO fail.

-explicit_uniq

ECO will automatically uniquify the parent cell instances by default. If the flag is set, all of the parent cell instances will be required to be uniquified before making ECO change into the design.

-loose_name_match

ECO will match hierarchy nets with exact same name as change files by default. If this flag is set, hierarchical net names will be matched with loose rules. ECO will match hierarchy nets with exact same name at first, and then try the match again with escaped or unescaped name. **NOTE:** This flag is only applicable to nets.

-softmacro

ECO will make changes only to logical hierarchy design by default. All logical

hierarchy data exist in single Milkyway cell. If this flag is set, ECO will make changes in physical hierarchy designs, which include multiple Milkyway cells and are stored as softmacro instances in top level Milkyway design.

DESCRIPTION

This command updates both flat and hierarchy information of the design cell according to the hierarchy ECO change file. The hierarchy information data will keep consistency with the flat cell.

Hierarchy ECO (HECO) Syntax

read_mw_eco_list will read the hierarchy ECO change file and modify both hierarchical and flat data step by step. The operations supported by **read_mw_eco_list** include:

Uniquification

 Uniquify hierarchical cell instance
 +HU [hierPath/]hierCIName newHierCIMName

Port Operations

 Add new port / hierarchical port instance
 +HP [hierPath/]hierCIName hierPoIMName direction

 Remove port / hierarchical port instance
 -HP [hierPath/]hierCIName hierPoIMName

 Rename port / hierarchical port instance
 *HP [hierPath/]hierCIName hierPoIMName newHierPoIMName

Net Operations

 Add new flat / hierarchical net
 +HN hierPath/NetName

 Remove flat / hierarchical net
 -HN hierPath/NetName

 Rename flat / hierarchical net
 *HN hierPath/NetName newNetName

Connection Operations

 Connect flat / hierarchical net with port / hierarchical port instance
 +HC hierPath/NetName [childCIName/]PoIMName
 Disconnect port / hierarchical port instance from flat / hierarchical net
 -HC hierPath/NetName [childCIName/]PoIMName

Instance Operations

 Add new flat / hierarchical cell instance
 +HI [hierPath/]CIName CIMasterName [viewName]

 Remove flat / hierarchical cell instance
 -HI [hierPath/]CIName [CIMName] [CIType]

```
Rename flat / hierarchical cell instance
*HI [hierPath/]CIName newCIName

Resize flat cell instance
+HR [hierPath/]CIName newCIMName [oldCIMName]
Note: only flat cell instance resizing is supported

Move flat / hierarchical cell instance into another
hierarchical branch
*HT [hierPath/]CIName [newHierPath/]newCIName
Note: all connections to the cell instance will be cut down
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

Following are examples of changes made on Milkyway design cells.

The following example is to make changes from the hierarchy ECO to a change file

```
prompt> read_mw_eco_list \
-change_file eco_changefile.txt orig_design
```

SEE ALSO

read_parasitics

Reads parasitics information from a disk file for the delay calculation tools.

SYNTAX

```
int read_parasitics
[-format SPEF | SBPF]
[-syntax_only]
[-max_file max_file_name
[-min_file min_file_name]]
[-keep_capacitive_coupling]
[-triplet_type min | typ | max]
| | [-eco]
[-ilm_context]
[file_list]
```

Data Types

<i>max_file_name</i>	string
<i>min_file_name</i>	string
<i>file_list</i>	list

ARGUMENTS

-format SPEF | SBPF
Specifies that parasitics files are to be read in either Standard Parasitic Exchange Format (SPEF) or Synopsys Binary Parasitic Format (SBPF).

-syntax_only
Specifies only to parse the files.

-max_file *max_file_name*
Specifies to read the file that contains the maximum parasitic data for the current design. This option is can be used alone or in conjunction with the **-min_file** option. The **-max_file** and *file_list* options are mutually exclusive; you can use only one.

-min_file *min_file_name*
Specifies to read the file that contains the minimum parasitic data for the current design. If you use this option, you must also use the **-max_file** option. The **-min_file** and *file_list* options are mutually exclusive; you can use only one.

-keep_capacitive_coupling
Specifies to retain coupling capacitances.

-triplet_type min | typ | max
Specifies the type of RC values stored in the SPEF file. This option is only valid for SPEF files.

-eco
Reads parasitics in engineering change order (ECO) mode.

```
-ilm_context
    Reads parasitics with the interface logic model (ILM).

file_list
    Specifies the files to read. If not specified, the tool reads from the
    design_name_parasitics.reduced file, where you substitute the name of the
    current design for design_name. The file_list option is mutually exclusive
    with the -max_file and -min_file options.
```

DESCRIPTION

This command reads parasitics for the current design from a disk file.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example reads parasitics for all nets in the current design. The file named *top.sbpf* is in reduced Synopsys Binary Parasitic Format (SBPF).

```
prompt> read_parasitics -format sbpf top.sbpf
```

reset_design(2)
write_parasitics(2)
```

read_rail_maps

Reads rail map data from a map file.

SYNTAX

```
status read_rail_maps
[-file file_name]
```

Data Types

file_name string

ARGUMENTS

```
-file file_name
      Reads the specified map data file into IC Compiler. This map data file must
      have been generated by a compatible version of PrimeRail.
```

DESCRIPTION

This command reads a map data file generated by PrimeRail and loads it into IC Compiler. Reading a map data file into IC Compiler enables the display of PrimeRail maps generated by the **analyze_rail** command. It is not required to have a layout window open at the time this command is executed, but viewing of the loaded maps does require an open layout window. A map data file can contain data for one or many maps, depending upon the specific analyses performed via **analyze_rail** or the map file exported from **pgExportICCData** in PrimeRail standalone version. Please refer to *PrimeRail User Guide* for details.

EXAMPLES

The following example shows how to read a map file.

```
prompt> read_rail_maps -file map_file
```

SEE ALSO

analyze_rail(2)
remove_rail_maps(2)

read_saif

Reads a SAIF file and annotates switching activity information on nets, pins, ports, and cells in the current design.

SYNTAX

```
status read_saif
    -input file_name
    -instance_name name
    [-target_instance instance]
    [-ignore ignore_name]
    [-ignore_absolute ig_absolute_name]
    [-exclude exclude_file_name]
    [-exclude_absolute ex_absolute_file_name]
    [-names_file name_changes_log_file]
    [-scale scale_value]
    [-unit_base unit_value]
    [-khrate khrate_value]
    [-map_names]
    [-auto_map_names]
    [-rtl_direct]
    [-verbose]
```

Data Types

<i>file_name</i>	string
<i>name</i>	string
<i>ignore_name</i>	string
<i>ig_absolute_name</i>	string
<i>exclude_file_name</i>	string
<i>ex_absolute_file_name</i>	string
<i>name_changes_log_file</i>	string
<i>scale_value</i>	integer
<i>unit_value</i>	string
<i>khrate_value</i>	float

ARGUMENTS

```
-input file_name
    Specifies the name of the SAIF file to be read.

-instance_name name
    Specifies the name of the instance of the current design as it appears in the
    SAIF file. The read_saif command assumes that the current design is
    instantiated as an instance in the testbench used to generate the SAIF file.
    The current design appears as an instance in the SAIF file. The read_saif
    command annotates all sub-instances in the hierarchy of the specified
    instance, and annotates the instance itself. Please enter each instance name
    completely, without any trailing hierarchy separator (/).

-target_instance instance
    Specifies the target instance on which the switching activity in the SAIF
```

file is to be annotated. If not specified, the target instance is assumed to be the current instance.

-ignore ignore_name

Specifies the name of an instance in the SAIF file for which switching activity is to be ignored. The **read_saif** command ignores switching activity within the hierarchy of that instance in the SAIF file. The *ignore_name* option can be a hierarchical name separated by a slash (/). The **-instance_name** is applied first. The **read_saif** command then strips off the prefix of a net name that matches *name* before deciding whether or not this net name is under the hierarchy specified by the **-ignore** option.

-ignore_absolute ig_absolute_name

Specifies the name of an instance in SAIF file for which switching it ignored, but this option is not affected by the **-instance_name** argument. The **read_saif** command determines whether a net name is under the **-ignore** hierarchy before applying the **-instance_name** argument.

-exclude exclude_file_name

Specifies the name of a file that contains a list of names to be ignored. The *exclude_file_name* option is used when you want to ignore switching activity for several instances. The file must contain each *ignore_name* on a separate line, without the **-exclude** option. The ignored names are recognized after the **-instance_name** argument.

-exclude_absolute ex_absolute_file_name

Specifies the name of a file that contains a list of absolute names to be ignored. The absolute names are not affected by the **-instance_name** argument.

-names_file name_changes_log_file

Specifies a previously-created log file, which is usually the output of a **change_names -log** command. The log file is used as the input to **read_saif**. Whereas the design file can contain multiple name changes, the SAIF file contains only the original object names. So the object search by name might fail to find objects with names that were changed. The *name_changes_log_file* contains a list of **change_names** commands for cells, ports, and nets in the current design. The file provides mapping information so that **read_saif** can identify the correct objects, even if the names have changed. Note that *name_changes_log_file* is a text file, and it can be edited manually to include other name changes that are not captured by the **change_names** command.

-scale scale_value

Specifies the value of the scaling factor for the base synthesis time unit. Allowed values for *scale_value* are **1** (the default), **10**, or **100**. The synthesis time unit is usually obtained automatically from the target library. In some cases the target library is unknown and **read_saif** issues a warning that the intended synthesis time unit is assumed to be 1 ns (nanosecond). For example, this can occur when **read_saif** is issued before the **compile** command. If this warning message appears and the time unit of the intended target library is not 1 ns, then use the **-scale** and **-unit_base** options to specify the time unit of the intended target library. For instance, if the intended time units are 100 ps, the required options are **-scale 100 -unit_base ps**.

-unit_base unit_value

Specifies the base synthesis time unit. Allowed values for *unit_value* are **ns**

(the default), **us**, or **ps**. See the **-scale** argument above for information about using it with the **-unit_base** option.

-khrate *khrate_value*

Specifies a default derating factor value to use for inertial glitches in the SAIF file. If **-khrate** is not specified, the tool uses the default derating factor of 0.5.

-map_names

Specifies that the SAIF name mapping mechanism is used to match the objects in the SAIF file with the design objects.

-auto_map_names

Specifies that a name mapping will be created automatically using SAIF file, and the created name mapping will be used to read the SAIF file. The **-auto_map_names** flag basically has the effect of creating the name mapping information using **saif_map -create_map** and reading in the SAIF file information using **read_saif -map_names**.

-rtl_direct

Indicates that the SAIF file was generated from RTL simulation without reading in an RTL forward SAIF file. When using this option, make sure that the SAIF file obtained from simulation was done on an RTL design, and that no RTL forward SAIF files were used.

Examples of RTL simulation flows that do not use RTL forward SAIF files include:

- When using the vpower PLI/FLI, the **read_rtl_saif** command was not performed, and the net monitoring was set to *rtl_on* using the **set_gate_level_monitoring** command in the PLI, and the **set_net_monitoring_policy** command in FLI.
- When using the vcd2saif utility, the **-rtl** argument was not used. For more information about using the vpower PLI for Verilog, the power FLI interface for the MTI VHDL simulator, and the vcd2saif application, see the Power Compiler manuals. manuals and the appropriate usage files. Please note that flows involving forward RTL SAIF files, and flows involving the **read_saif -rtl_direct** will be made obsolete in future releases. Use flows involving the **saif_map** and **read_saif -map_names** and **-auto_map_names** instead.

-verbose

Specifies to show information in verbose message mode. Verbose messages include showing the warnings on design objects in the SAIF file that cannot be annotated on the design.

DESCRIPTION

The **read_saif** command reads a SAIF file, and annotates the switching activity attributes **toggle_rate** and **static_probability** for nets, ports, and pins of the current design. The **report_power** command uses this information to calculate dynamic power values. If a particular object in the SAIF file is not found in the current design, the tool ignores the object and issues a warning message. The **read_saif** command returns 1 if at least one of the objects in the file is successfully annotated. Otherwise, it returns 0.

To identify the instance (and corresponding subinstances) you want to annotate, use the **-instance_name** option. To set the synthesis timing unit, use **-unit_base** and **-scale**, unless you are certain that the synthesis timing unit is 1 ns. To specify a default derating factor other than 0.5, use the **-khrate** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example annotates the switching activity on the current design, which has been instantiated as Test/U1 in the simulation testbench:

```
prompt> read_saif -input file -instance_name Test/U1
```

The following commands annotate the current design, which has been instantiated as Test/U1 in the simulation testbench, assuming that the man library timing unit is 10 ns:

```
prompt> read_saif -input file -instance Test/U1 -scale 10 \
-unit ns
```

```
prompt> read_saif -input file -instance Test/U1 -scale 10
```

The commands below demonstrate annotation of multiple designs. The *foo1* design is instantiated as Test1/U1, and the *foo2* design is instantiated as Test1/U2.

```
prompt> current_design foo1
```

```
prompt> read_saif -input file_1 -instance Test1/U1 -scale 10
```

```
prompt> current_design foo2
```

```
prompt> read_saif -input file_2 -instance Test1/U2 -scale 10
```

The following examples illustrate the use of the **-names_file** option. In the first three commands, the *name_changes.log* file is created. In the fourth command, the *name_changes.log* file is used as input to the **read_saif** command. The name changes recorded in *name_changes.log* are used in name matching during execution of **read_saif**.

```
prompt> read_ddc design.ddc
prompt> define_name_rules my_rules -restricted "A-Z"
prompt> change_names -rule my_rules -log name_changes.log
prompt> read_saif -input file -instance Test/U1 \
-names name_changes.log
```

read_saif

1326

read_sdc

Reads in a script in Synopsys Design Constraints (SDC) format.

SYNTAX

```
status read_sdc
file_name
[-echo]
[-syntax_only]
[-version sdc_version]
```

Data Types

<i>file_name</i>	string
<i>sdc_version</i>	string

ARGUMENTS

<i>file_name</i>	Specifies the name of the file that contains the SDC script to be read.
<i>-echo</i>	Indicates that each constraint is to be echoed as it is executed.
<i>-syntax_only</i>	Indicates that SDC script is processed only to check the syntax and semantics of the script.
<i>-version <i>sdc_version</i></i>	Specifies the version of SDC to which the file conforms. Allowed values are 1.0, 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, and latest (the default).

DESCRIPTION

This command reads in a script file in Synopsys Design Constraints (SDC) format, which contains commands for use by PrimeTime or by Design Compiler in its Tcl mode. SDC is also licensed by external vendors through the Tap-in program. SDC formatted script files are Tcl scripts that use a subset of the commands supported by PrimeTime and Design Compiler.

By default, **read_sdc** executes the constraints as they are read. If there are errors part way through the script, it is possible that some constraints are applied, and some are not. You can use the **-syntax_only** option to simply check the script without applying any constraints. This also verifies conformance to the specified SDC version. If there are any errors during the checking phase, then the result of **read_sdc** is 0.

Like **source**, the **read_sdc** command is sensitive to variables that control script execution (for example, **sh_continue_on_error** and **sh_script_stop_severity**). The **read_sdc** command uses **sh_source_uses_search_path** to determine if **search_path** is used to find the script.

read_sdc supports several file formats. The file can be a simple ascii script file, an ascii script file compressed with gzip, or a Tcl bytecode script, created by TclPro Compiler.

Note that SDC does not allow command abbreviation. Also note that **exit** and **quit** do not cause the application to exit, but they do cause the reading of the SDC file to stop.

The latest SDC Version supports the following commands. Those added for versions 1.3 and later are noted. Some constraints which PrimeTime ignores are not listed.

```

For a complete guide to using SDC with Synopsys applications, see the *Using the Synopsys Design Constraints Format Application Note* which is available through SolvNET at <http://solvnet.synopsys.com>.

The usage of some of these commands is restricted when reading SDC. In some cases, some command options are not allowed. In some applications, some of the commands are not supported. For example, PrimeTime does not support the **set_logic*** commands. These commands are ignored when loaded in with **read_sdc**, with a message (for an example, see the EXAMPLES section). If a command not supported by SDC is found by **read_sdc**, it appears as an unknown command, with a message. The same condition exists for command options. If an option is not supported by SDC, a message is issued indicating that condition. However, if the option is unknown, a different message is issued.

Note that although **create_generated_clock** is supported (beginning with version 1.3), there is no provision for the **get_generated_clocks** shortcut which is available in PrimeTime and Design Compiler. Generated clocks are simply clocks with some additional attributes and in SDC, they are retrieved through the **get_clocks** command.

The following features are added for SDC Version 1.5 or later:

set_clock_latency -clock option, **set_timing_derate** command with all options, **set_max_transition -clock_path -data_path -rise -fall** options, **set_clock_uncertainty -rise/fall_from/to** options, **set_operating_conditions -object_list** option, synonyms for all **get_object** commands, **get_objects -nocase** support independently with **-regexp**, **get_objects -regexp** support, **get_objects -of_objects** support for **get_cells/get_nets/get_pins**.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example reads the SDC script top.sdc.

```
prompt> read_sdc top.sdc -version 1.2
```

```
Reading SDC version 1.2...
1
```

The following example reads the SDC script top2.sdc. The script contains commands not supported by SDC, and CMD-005 messages are generated for those commands.

```
prompt> read_sdc -syntax_only top2.pt -version 1.2
Checking syntax/semantics using SDC version 1.2...
Error: Unknown command 'link_design' (CMD-005)
** Completed syntax/semantic check with 1 error(s) **
0
```

The following example shows the result when an unsupported command is in an SDC file. One SDC message is generated per instance of an unsupported command. At the end of the read, a summary of all unsupported commands in the file is generated. This SDC file was read into PrimeTime.

```
prompt> read_sdc t2.sdc -version 1.2
Reading SDC version 1.2...
Warning: Constraint 'set_logic_zero' is not supported by pt_shell. (SDC-3)
Warning: Constraint 'set_logic_zero' is not supported by pt_shell. (SDC-3)
Warning: Constraint 'set_logic_one' is not supported by pt_shell. (SDC-3)

Summary of unsupported constraints:
Information: Ignored 1 unsupported 'set_logic_one' constraint. (SDC-4)
Information: Ignored 2 unsupported 'set_logic_zero' constraints. (SDC-4)

1
```

The following example is a script that is not SDC-compliant, because it contains unsupported commands or command options.

```
current_design TOP
set_resistance -value 12.2 [get_nets i1t2]
```

The following example shows the output generated by **read_sdc** when reading the previous script. In SDC, **current_design** can be used only to get the current design; no arguments are allowed. Also, there is no **-value** option for **set_resistance**, so an appropriate message is generated.

```
prompt> read_sdc t3.tcl -echo -version 1.2
Reading SDC version 1.2...
current_design TOP
Error: extra positional option 'TOP' (CMD-012)
```

```
set_resistance -value 12.2 [get_nets i1t2]
Error: unknown option '-value' (CMD-010)
0
```

The following example shows the message generated when an option is supported by the command but not by SDC.

Information: The '-value' option for set_resistance is unsupported. (CMD-038)

read_sdf

Reads leaf cell and net timing information from a file in Standard Delay Format (SDF) and uses that information to annotate the current design.

SYNTAX

```
string read_sdf
[-load_delay net | cell]
[-path path_name]
[-min_type sdf_min | sdf_typ | sdf_max]
[-max_type sdf_min | sdf_typ | sdf_max]
[-worst]
[-min_file min_sdf_file_name]
[-max_file max_sdf_file_name]
sdf_file_name
```

Data Types

<i>path_name</i>	string
<i>min_sdf_file_name</i>	string
<i>max_sdf_file_name</i>	string
<i>sdf_file_name</i>	string

ARGUMENTS

-load_delay net | cell
Indicates whether load delays are included in net delays or in cell delays in the timing file being read. The load delay is the portion of cell delay arising from the capacitive load of the net driven by the cell. The default is **cell**.

-path *path_name*
Specifies the path from the current design to the subdesign for which the timing file has been created.

-min_type *sdf_min* | *sdf_typ* | *sdf_max*
Specifies which of the SDF triplet delay values are to be read from the SDF file for minimum delay. Delays in SDF are represented in the form of triplets (*sdf_min*:*sdf_typ*:*sdf_max*). If this is not specified, the command uses **sdf_min**.

-max_type *sdf_min* | *sdf_typ* | *sdf_max*
Specifies which of the SDF triplet delay values are to be read from the SDF file for maximum delay. Delays in SDF are represented in the form of triplets (*sdf_min*:*sdf_typ*:*sdf_max*). If this is not specified, the command uses **sdf_max**.

-worst
Indicates that **read_sdf** is to annotate the current design only with delays worse than the current annotated delays; this applies to annotated net and cell delays and annotated timing checks. For the hold timing check, the minimum numerical value is annotated after comparing the current annotated

value and the new value. For all other timing checks and delays, the maximum numerical value is annotated after comparing the current annotated value and the new value. Use this option when the timing file contains conditional timing.

To annotate the worst timing delay and timing checks of all timing conditions for each pin-to-pin annotation, use the **remove_annotated_delay** command with the **-all** option and the **remove_annotated_check** command before using the **read_sdf** command with the **-worst** option. Note that this behavior does not depend on the type of timing arc being read (that is, whether the arc is a setup or a hold arc), even though it might appear that minimum values are read for hold timing arcs. The correct behavior is one where all the values read from SDF files are either minimum, typical, or maximum, regardless of the type (setup or hold).

-min_file min_sdf_file_name

Specifies the file from which minimum delay timing information is to be read. The timing file must be in SDF format version v1.0, v2.0, or v2.1. Use this option only if the minimum and maximum delays are in two separate SDF files. The default is for minimum and maximum delays to be in a single SDF file.

-max_file max_sdf_file_name

Specifies the file from which maximum delay timing information is to be read. The timing file must be in SDF format version v1.0, v2.0, or v2.1. Use this option only if the minimum and maximum delays are in two separate SDF files. The default is for minimum and maximum delays to be in a single SDF file.

sdf_file_name

Specifies the name of the file from which the timing information is to be read. The timing file must be in SDF format version v1.0, or v2.1.

DESCRIPTION

This command reads from a disk file SDF leaf cell and net timing information and uses it to annotate the current design. The timing file must be in SDF format v1.0 or v2.1. Instance-specific pin-to-pin cell and net delays are read from the SDF file and annotated on the current design. When you specify the **-path** option, the command annotates the current design with information from a timing file created for an instance of a subdesign of the current design. When you specify a subdesign, you cannot annotate the current design with the net delays to the ports of the subdesign.

The load delay, also known as extra source gate delay, is that portion of the cell delay caused by the capacitive load of the driven net. Some delay calculators consider the load delay part of the net delay; others consider the load delay part of the cell delay. By default, the **read_sdf** command treats the load delay as part of the cell delay in the timing file being read. Use the **-load_delay net** option to indicate that your timing file includes the load delay in the net delay instead of in the cell delay.

Setup and hold, recovery, and removal timing checks, when present in the timing file, are used to annotate the current design. The SDF constructs for setup and hold are "SETUP" and "HOLD". The SDF construct for recovery and removal are "RECOVERY", "REMOVAL" and "RECREM."

Instance names in the design must match instance names in the timing file. For example, if the timing file is created from a design using VHDL naming conventions, the design must use VHDL naming conventions. To modify design names, use the **change_names** command.

To remove delays read and annotated by using the **read_sdf** command, use the **reset_design** or **remove_annotated_delay** command. To remove timing checks annotated with **read_sdf**, use the **remove_annotated_check** command.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example reads the adder.sdf timing file from disk and uses it to annotate the timing on the current design. The timing file contains load delays included in the cell delays.

```
prompt> read_sdf -load_delay cell adder.sdf
```

The following example reads the timing information of instance *u1* of design *MULT16* from the *mult16_u1.sdf* disk file, which contains the timing for instance *u1* of design *MULT16*. The timing is annotated on the design *MY DESIGN*. In this case, load delay is included in the net delays.

```
prompt> current_design MY DESIGN
prompt> read_sdf -load_delay net -path u1 mult16_u1.sdf
```

The following example reads minimum and maximum timing information from two separate SDF files and annotates the current design with delays corresponding to minimum and maximum operating conditions, respectively.

```
prompt> read_sdf -min_file min.sdf -max_file max.sdf
```

read_tdf_ports

Reads in a Top Design Format (TDF) file and translates the "pin" and "pad" to mpc constraints for ports in the floorplan in the mpc flows.

SYNTAX

```
int read_tdf_ports
[TDF file]
-output string
-apply
-verbose
```

ARGUMENTS

TDF file
Specifies TDF file to be read. This argument is mandatory.

-output string
Specifies the output file created by the command containing the mpc constraints for the input data which can be applied to the design. This command will just write the output file if you want to apply at the same time are writing the output file then provide the -apply switch.

-apply
Specifies the mpc constraints generated should be applied directly to the design.

-verbose
Instructs the command to write out verbose messages while parsing and processing the data from TDF file.

DESCRIPTION

This command reads in the pin and pad functions from the Timing Definition Format (TDF) file and creates port constraints for MPC as specified in the **set_mpc_port_options** command.

If you are having trouble creating a TDF file you can create same constraints using the **set_mpc_port_options** command.

MPC flow supports pad placement by getting its location from the port it is connected to.

The following functions will be read in from a tdf file pad padName padSide [padorder] [padOffset] pin pinName layer width height pinSide [pinOrder] [pinOffset]

For details on tdf Syntax see the TDF syntax documentation.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples shows how read in a tdf file.

```
prompt> read_tdf_ports -output "port_cons.tcl" input_tdf.tdf prompt>
read_tdf_ports -output "port_cons.tcl" -apply input_tdf.tdf prompt>
read_tdf_ports -verbose input_tdf.tdf
```

```

read_verilog

Reads in one or more design or library files in Verilog format.

SYNTAX

```
status read_verilog
[-dirty_netlist]
[-allow_black_box]
[-verbose]
[-bus_direction_for_undefined_cell connection | msb | lsb]
[-keep_module keep_module_list]
[-top top_module_name]
[-cell cell_name]
| verilog_files
```

Data Types

<i>keep_module_list</i>	list
<i>top_module_name</i>	string
<i>cell_name</i>	string
<i>verilog_files</i>	list

ARGUMENTS

-dirty_netlist

Controls whether the Verilog reader handles a dirty netlist. A dirty netlist is a Verilog netlist that contains objects that are inconsistent with the design libraries, such as floating pins, nets, and pins or ports. When the Verilog reader reads in a dirty netlist, it checks for the following missing or incomplete information issues warning messages, and then creates objects that allow the tool to continue:

- Missing reference cell in the reference library

There is no reference cell available in the reference libraries and the definition is not in the input Verilog file.

- Port definition is inconsistent with the reference library

There are additional ports present that are not available in the reference library.

- Port definition is inconsistent with the reference cell

There are additional ports present that are not available in the reference cell definition.

-allow_black_box

Allows the tool to continue if a module cannot be found in the reference libraries or in the input Verilog file.

If you do not specify this option, **read_verilog** issues an error message and quits when it finds an undefined module.

-verbose

Displays verbose information including possible top module names, black box

names, and module names with mismatched ports.

-bus_direction_for_undefined_cell connection | msb | lsb
Specifies the bus direction for an undefined cell. If an undefined module is instantiated, **read_verilog** determines the bus direction according to one of following three factors: connection, msb, or lsb. By default, it determines the bus direction from the connection.

-keep_module *keep_module_list*
Specifies the list of keep modules. For each module in the list, the Verilog reader does not expand it into the top cell. Instead, it expands it into a soft macro cell and instantiates it in the top cell. This is for the design planning top-down flow.

-top *top_module_name*
Specifies the top module name. The top module is the module that is not instantiated by any other modules. Generally there is only one top module in a design and **read_verilog** can scan and identify the top module automatically. However, if the design has multiple top modules, you must use this option to specify one of the modules.

-cell *cell_name*
Specifies the cell name. The tool creates the design in the Milkyway database using the specified cell name. If not specified, the tool uses the name of the top module as the cell name.

verilog_files
Specifies the name of one or more Verilog files to be read.

DESCRIPTION

The **read_verilog** command loads in netlist information from one or more Verilog files.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

rebuild_mw_lib

Rebuilds the Milkyway library.

SYNTAX

```
status_value rebuild_mw_lib
libName
```

Data Types

libName string

ARGUMENTS

libName

Specifies the Milkyway library to be rebuilt. The value of *mw_lib* should be a valid library name. The library must be closed for this command to work.

DESCRIPTION

This command rebuilds a Milkyway library by scanning all designs in the associated library directory.

The command returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example rebuilds the current Milkyway library:

```
prompt> rebuild_mw_lib
Scanning library...
place.CEL;5
place.CEL;4
place.CEL;3
place.CEL;2
place.CEL;1
place.EXP;1
place.NETL;1
place.PARA;1
Rebuilding library...
A total of 8 items have been rebuilt. (0 removed, 0 new added)
1
```

`open_mw_lib(2)`
`rename_mw_lib(2)`
`report_mw_lib(2)`

recover_tie_connection

Recover tie connection from direct PG implementation.

SYNTAX

```
status recover_tie_connection
[-net pg_net_list]
[-cell cell_list]
[-hierarchy_based]
```

Data Types

pg_net_list list

ARGUMENTS

-net pg_net_list

If this option is specified, the recovery will be performed on these flat/hierarchical PG nets and the PG nets connecting to them. If anything in the list is not found or is not a PG net, the command will issue an error message and stop. If this option is not specified, the operation will be performed on all PG nets.

-cell cell_list

If a leaf cell is specified, the recovery will be performed on the tie pin/port which drives the tie on the leaf cell. If a hier cell is specified, the recovery will be performed on all the leaf cells within this hier cell as if all these leaf cells are specified.

If anything in the list is not found or is not a cell, the command will issue an error message and stop. If this option is not specified, the operation will be performed on the entire design.

-hierarchy_based

This option needs to be specified with "-cell" option. When both "-hierarchy_based" and "-cell" options are specified, "-cell" option has to specify hierarchical cells. Under this circumstance, the recovery will be performed on all ties within those specified hierarchical cells.

DESCRIPTION

This command disconnects PG net connection to a tie pin/port, and then connects the tie pin/port to a tie net.

EXAMPLES

The following example uses the **recover_tie_connection** to recover tie connection from direct PG implementation. The **report_tie_net** command is used to verify the Milkyway net connection before and after the command.

```
prompt> recover_tie_connection
```

```
1
prompt> report_tie_net
Design has 1 tie high net(s):

net SNPS_LOGIC1 connects with following port(s) or pin(s):
U222/A
1
```

SEE ALSO

`derive_pg_connection(2)`

redirect

Redirects the output of a command to a file.

SYNTAX

```
string redirect
[-append] [-tee] [-file
| -variable
| -channel] [-compress]
target
{command_string}
```

Data Types

<i>target</i>	string
<i>command_string</i>	string

ARGUMENTS

-append

Appends the output to *target*.

-tee

Like the unix command of the same name, sends output to the current output channel as well as to the *target*.

-file

Indicates that *target* is a file name, and redirection is to that file. This is the default. It is exclusive of **-variable** and **-channel**.

-variable

Indicates that *target* is a variable name, and redirection is to that Tcl variable. It is exclusive of **-file** and **-channel**.

-channel

Indicates that *target* is a Tcl channel, and redirection is to that channel. It is exclusive of **-variable** and **-file**.

-compress

Compress when writing to file. If redirecting to a file, then this option specifies that the output should be compressed as it is written. The output file is in a format recognizable by "gzip -d". You cannot specify this option with **-append**.

target

Indicates the target of the output redirection. This is either a filename, Tcl variable, or Tcl channel depending on the command arguments.

command_string

The command to execute. Intermediate output from this command, as well as the result of the command, will be redirected to *target*. The *command_string* should be rigidly quoted with curly braces.

DESCRIPTION

The **redirect** command performs the same function as the traditional unix-style redirection operators > and >>. The *command_string* must be rigidly quoted (that is, enclosed in curly braces) in order for the operation to succeed.

Output is redirected to a file by default. Output can be redirected to a Tcl variable by using the *-variable* option, or to a Tcl channel by using the *-channel* option.

Output can be sent to the current output device as well as the redirect target by using the *-tee* option. See the examples section for an example.

The result of a **redirect** command which does not generate a Tcl error is the empty string. Screen output occurs only if errors occurred during execution of the *command_string* (other than opening the redirect file). When errors occur, a summary message is printed. See the examples.

Although the result of a successful **redirect** command is the empty string, it is still possible to get and use the result of the command that you redirected. Construct a **set** command in which you set a variable to the result of your command. Then, redirect the **set** command. The variable holds the result of your command. See the examples.

The **redirect** command is much more flexible than traditional unix redirection operators. With **redirect**, you can redirect multiple commands or an entire script. See the examples for an example of how to construct such a command.

Note that the builtin Tcl command **puts** does not respond to output redirection of any kind. Use the builtin **echo** command instead.

EXAMPLES

In the following example, the output of the plus procedure is redirected. The echoed string and the result of the plus operation is in the output file. Notice that the result was not echoed to the screen.

```
prompt> proc plus {a b} {echo "In plus" ; return [expr $a + $b]}
prompt> redirect p.out {plus 12 13}
prompt> exec cat p.out
In plus
25
```

In this example, a typo in the command created an error condition. The error message indicates that you can use **error_info** to trace the error, but you should first check the output file.

```
prompt> redirect p.out {plus2 12 13}
Error: Errors detected during redirect
      Use error_info for more info. (CMD-013)
prompt> exec cat p.out
Error: unknown command 'plus2' (CMD-005)
```

In this example, we explore the usage of results from redirected commands. Since the result of **redirect** for a command which does not generate a Tcl error is the empty string, use the **set** command to trap the result of the command. For example, assume that there is a command to read a file which has a result of "1" if it succeeds, and "0" if it fails. If you redirect only the command, there is no way to know if it succeeded.

```
redirect p.out {read_a_file "a.txt"}  
# Now what? How can I redirect and use the result?
```

But if you set a variable to the result, then it is possible to use that result in a conditional expression, etc.

```
redirect p.out {set rres [read_a_file "a.txt"]}  
if {$rres == 1} { echo "Read ok!"  
}
```

The **redirect** command is not limited to redirection of a single command. You can redirect entire blocks of a script with a single **redirect** command. This simple example with **echo** demonstrates this feature:

```
prompt> redirect p.out {  
?     echo -n "Hello "  
?     echo "world"  
?  
}  
prompt> exec cat p.out  
Hello world  
prompt>
```

The **redirect** command allows you to tee output to the previous output device and also to redirect output to a variable. This simple example with **echo** demonstrates these features:

```
prompt> set y "This is "  
This is  
prompt> redirect -tee x.out {  
echo XXX  
redirect -variable y -append {  
echo YYY  
redirect -tee -variable z {  
echo ZZZ  
}  
}  
}  
XXX  
prompt> exec cat x.out  
XXX  
prompt> echo $y  
This is YYY  
ZZZ
```

```
prompt> echo $z
ZZZ
```

SEE ALSO

`echo(2)`
`error_info(2)`

redo

Redoes last undo operation

SYNTAX

```
status redo
[-all]
[-mark string]
```

ARGUMENTS

```
-all
    Redo all operations in undo stack

-mark string
    Redo all operations in undo stack to the named mark
```

DESCRIPTION

This command redoes the last undone operation. The **redone** command can be undone using the **undo** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example undoes the result of **move_objects** and then redoes it.

```
prompt> move_objects -to {1400 1600} [get_route_guides *]
prompt> undo
prompt> redo
```

SEE ALSO

```
undo(2)
undo_mark(2)
undo_config(2)
```

reduce_fp_rail_stacked_via

Given a complete or partial power network, you can select a set of stacked vias in the power network for removal to reduce congestion. This command honors the specified voltage (IR) drop constraint and maintains power network connectivity. The layer-based global route congestion maps are required for this command.

route_zrt_global, **route_global** or **route_fp_proto** can be used to create the congestion maps. The **reduce_fp_rail_stacked_via** command does not physically remove the selected stacked vias. Signal vias are not removed. Power network stacked vias in hard-macros or soft-macros are not removed. Power network stacked via reduction does not support running more than two nets at a time.

SYNTAX

```
status reduce_fp_rail_stacked_via
-nets nets
[-power_budget power]
[-analyze_power]
[-lowest_voltage_drop]
[-target_voltage_drop target_voltage]
[-voltage_supply voltage]
[-effort low | medium | high]
[-pad_lib_cells pad_lib_cells]
[-read_pad_instance_file file_name]
[-read_pad_lib_cell_file file_name]
[-extract_stacked_via_only]
[-use_pins_as_pads]
[-top_level_only]
[-ignore_blockages]
[-ignore_conn_view_layers layer]
[-read_power_compiler_file file_name]
[-read_prime_power_file file_name]
[-read_default_power_file file_name]
[-output_directory directory_name]
```

Data Types

<i>nets</i>	collection or list
<i>power</i>	float
<i>target_voltage</i>	float
<i>voltage</i>	float
<i>pad_lib_cells</i>	string
<i>file_name</i>	string
<i>layer</i>	collection of list
<i>directory_name</i>	string

ARGUMENTS

-nets *nets*
Specifies the names of the power or ground nets on which to perform power network stacked via reduction.

-power_budget power
 Specifies a total power budget for the design. The power budget is divided among the instances according to their sizes. For hard macros or standard cells, the power budget is computed based on the percentage of the total area. For a hierarchical block, it is computed based on the sum of all cells and blocks inside it. The power unit is in milliwatts. The default is **1000**.

-analyze_power
 Specifies power analysis for each cell instance from IC Compiler by considering specified switching probabilities. Before using this option for power analysis, the default toggle rate (default is 0.1) and default static probability (default is 0.5) for primary inputs and black box outputs can be set by using the **set power_default_toggle_rate** and **set power_default_static_probability** commands. The toggle rate and/or static probability for a specified object, for example, a net, pin or port can be set by using the **set_switching_activity** command. The switching activity interchange format (SAIF) file may also be read by using the **read_saif** command. The **set_cell_internal_power** command can be used to set the power value of a pin per toggle. Refer to the **report_power** command for more detailed information. It is recommended that you run the **report_power -cell -flat -nosplit** command before you use **-analyze_power** option.
 The **-analyze_power** option can be used concurrently with the **-power_budget** option. If a power budget is specified using **-power_budget** together with **-analyze_power** and the power budget is larger than the sum of the instance power calculated by **-analyze_power**, the difference between the power budget and the total power by **-analyze_power** will be assigned to those instances that are not assigned in **-analyze_power** if there are any such instances. Otherwise, the power budget is ignored. By default, the power budget is set to 0 with **-analyze_power** option.
-analyze_power can also be used concurrently with **-read_default_power_file**. The power specified in the default power file has a higher priority than that calculated by the **-analyze_power** option, that is, if the power value is calculated and read from the default power file for one instance, the instance is assigned with the power from the default power file.
"-analyze_power" is mutually exclusive with "-read_power_compiler_file" and "-read_prime_power_file".
 By default, power is NOT calculated from IC Compiler unless this option is explicitly used.

-lowest_voltage_drop
 Specifies power network stacked via reduction to maintain the voltage (IR) drop of the existing power network when removing stacked vias. By default, this option is off.

-target_voltage_drop target_voltage
 Specifies target voltage (IR) drop constraint for power network stacked via reduction when stacked vias are removed from the existing network. The unit is millivolt.

-voltage_supply voltage
 Specifies the supply voltage for the power network. The voltage unit is volts. The default is **1.5**.

-effort low | medium | high
 Specifies the CPU effort for power network stacked via reduction. The default

is medium effort.

-pad_lib_cells pad_lib_cells

Specifies the pad library cells and the associated net as follows

net_name:pad_lib_cell_name

If net name is not specified, the pad library cell is used for both power and ground nets. By default, all the pads logically connected to signal **1** or **0** are assumed as power pads.

-read_pad_instance_file file_name

Specifies the pad instance file name and optionally, the net name. If you do not specify the net name, the command assumes that the specified pad instance is used for both power and ground nets.

The *instance_and_net* format is as follows:

instance_name [net_name]

For example, a valid *instance_and_net* value might be **VDD1 VDD**. By default, this option is off.

-read_pad_lib_cell_file file_name

Specifies the pad library cell file name and optionally, the net name. If you do not specify the net name, the command assumes that the specified pad library cell is used for both power and ground nets. The *lib_cell_name_and_net* format is as follows:

lib_cell_name [net_name]

For example, a valid *lib_cell_name_and_net* value might be **VDD.FRAM VDD**. By default, this option is off.

-extract_stacked_via_only

Extracts all the removable stacked vias from the existing power network. The removable stacked vias can be extracted without affecting the power network connectivity, that is, each instance can still connect to a power pad through the power network, even when these removable stacked vias are removed.

This option also calculates the total congestion overflow and estimates the total congestion overflow due to all stacked vias in the power network, and the maximum potential overflow reduction if all removable stacked vias were removed. Voltage (IR) drop analysis is NOT performed with this option. In other words, this option estimates the most optimistic congestion reduction without considering the IR drop impact. When this option is on, options such as **-power_budget**, **-analyze_power**, **-lowest_voltage_drop**, **-target_voltage_drop**, **-voltage_supply**, **-effort** are ignored because the IR drop impact is not considered. By default, this option is off.

-use_pins_as_pads

Allows power network synthesis to use PG pins on the design boundary as PG pads. This option is useful in block-level simulation. The default is off.

-top_level_only

Ignores cells inside soft macros, but considers all the power and ground net wires and vias in the design. By default, all cell instances in each soft macro are flattened to the top-level design. Note that this option is only used for power network analysis purpose. The stacked vias in soft-macros are not to be removed. The default is off.

```

-ignore_blockages
    Ignores blockages due to hard macro blocks for virtual pad pseudo connection.
    By default, this option is off.

-ignore_conn_view_layers layer
    Ignores all metal layers (select the All option) or ignores specified metal
    layers (select the Specified option) in connectivity (.CONN) views. By
    default, this option is off and none of the metal layers is ignored.

-read_power_compiler_file file_name
    Obtains the power calculation source from a Power Compiler report file. By
    default, this option is off.

-read_prime_power_file file_name
    Obtains the power calculation source from a Prime Power/Prime Time PX report
    file. By default, this option is off.

-read_default_power_file file_name
    Uses the default format to obtain a power calculation. Refer to the
    synthesize_fp_rail or analyze_fp_rail commands for more detailed information
    regarding the default power file format.
    By default, the command also reads a power information file generated from
    AstroRail by using the poDumpPowerInfo command.

-output_directory directory_name
    Specifies the name of the directory in which to store the IR drop and
    electromigration results with the file name design_name.net_name.pw_hl.pna
    and the power allocation results with the file name design_name.net_name.power.
    The default is pna_output.

```

DESCRIPTION

This command allows you to perform power network stacked via reduction in a complete or partially built PG network. The layer-based global route congestion maps are required for this command. **route_zrt_global**, **route_global** or **route_fp_proto** can be used to create the congestion maps. A set of stacked vias in a congested area is selected for removal such that the voltage (IR) drop constraint is satisfied and the connectivity of the existing power network is maintained. After performing stacked via reduction, you can preview the IR drop map and electromigration (EM) if the selected stacked vias were removed. This command also estimates the congestion overflow reduction based on the existing congestion map if the selected stacked vias were to be removed. You can also find out where stacked vias are to be removed in the updated IR drop map. (The stacked via is not in the IR drop map if it is to be removed.) If the results and constraints are satisfied, you can commit the stacked via removal and remove these objects from the database by using the **remove_fp_rail_stacked_via** command.

If you use the **-extract_stacked_via_only** option, this command only estimates the congestion due to all stacked vias and the maximum potential reduction in congestion if all removable stacked vias were removed without affecting power network connectivity. IR drop impact is NOT considered with this option. With this option, you are able to decide if it is worthwhile to perform the actual stacked via reduction and reduce the turn-around time.

EXAMPLES

The following example shows how to perform stacked via reduction with medium effort on net *VDD* and *VSS* in the power network. The total power budget in the design is 1000mW, the voltage supply is 1.2V, the pad library cell is *pvdi.FRAM* for net *VDD* and *pvdo.FRAM* for net *VSS*, the lowest target IR drop is used for each net.

```
prompt> reduce_fp_rail_stacked_via\
    -nets {VDD VSS}\\
    -lowest_voltage_drop\
    -effort medium\
    -power_budget 1000\
    -voltage_supply 1.2\
    -pad_lib_cells "VDD:pvdi.FRAM VSS:pvdo.FRAM"
```

The following example shows how to estimate the congestion due to all stacked vias in net *VDD* and the maximum potential congestion overflow reduction if all removable stacked vias were removed without considering IR drop impact but maintaining the network connectivity.

```
prompt> reduce_fp_rail_stacked_via\
    -nets VDD\
    -extract_stacked_via_only\
```

```

refine_fp_macro_channels

Refines channels between macros to avoid congestion.

SYNTAX

```
status refine_fp_macro_channels
```

ARGUMENTS

The **refine_fp_macro_channels** command has no arguments.

DESCRIPTION

This command moves macros to adjust channels between them to the width as close to the optimal width based on the congestion map as possible. The command needs a congestion map to run. It will attempt to use the global route congestion map; if unavailable it will attempt to use the placement congestion map; if that one is unavailable as well, it will produce an error. The command will not touch fixed hard macros. Non-fixed hard macros must be inside core and not overlap each other or blockages. For a corresponding command to adjust channels between plan groups, see **shape_fp_blocks -adjust_channels**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLE

```
prompt> refine_fp_macro_channels
```

SEE ALSO

shape_fp_blocks(2)

refine_placement

Performs incremental placement with congestion optimization.

SYNTAX

```
int refine_placement
[-congestion_effort low | medium | high]
[-perturbation_level min | medium | high | max]
[-ignore_scan]
[-num_cpus number_of_cpus]
[-coordinate {X1 Y1 X2 Y2}]
```

Data Types

<i>number_of_cpus</i>	integer
<i>X1</i>	float
<i>Y1</i>	float
<i>X2</i>	float
<i>Y2</i>	float

ARGUMENTS

-congestion_effort low | medium | high
Specifies the effort level of the incremental congestion optimization. The default effort level is **medium**.

-perturbation_level min | medium | high | max
Specifies the perturbation level for the placement in order to optimize congestion. Specifying **min** produces the least amount of movement from the placement. The higher the level specified, the more movement you may expect from the placement, so specifying **max** produces the most movement from the placement. The default effort level is **medium**.

-ignore_scan
Ignores scan chain connections during placement.

-num_cpus *number_of_cpus*
Specifies the number of CPUs used in parallel during coarse placement. The *number_of_cpus* is an integer value that is less than or equal to the number of free CPUs on your machine and greater than or equal to 1. If unspecified, the default is to use 1 CPU.

-coordinate {*X1 Y1 X2 Y2*}
Specifies the coordinates of the area from which to run incremental congestion removal. The default is to run incremental congestion removal for the entire design.

DESCRIPTION

The **refine_placement** command performs incremental congestion optimization for the current design. This command does not touch netlist and it provides a legalized

placement at the end.

Multicorner-Multimode Support

This command uses information from active scenarios only.

EXAMPLES

The following example runs the **refine_placement** command in low effort congestion mode:

```
prompt> refine_placement -congestion_effort low
```

SEE ALSO

```
create_placement(2)
remove_congestion_options(2)
report_congestion(2)
report_congestion_options(2)
set_congestion_options(2)
```

remove_all_spacing_rules

Removes all inter-cell spacing rules from the current library.

SYNTAX

```
status remove_all_spacing_rules
```

ARGUMENTS

There are no arguments for this command

DESCRIPTION

This command removes permanently inter-cell spacing rules that have been set with commands `set_lib_cell_spacing_label` and `set_spacing_label_rule` from the currently opened library. In order to re-instate inter-cell spacing constraints, the user will have to rerun `set_lib_cell_spacing_label` and `set_spacing_label_rule` commands. If there are rules defined in multiple libraries, this command must be run for each library in order to delete all inter-cell spacing rules.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In the following example all rules are removed.

```
prompt> remove_all_spacing_rules
```

```
Info: Removing rules from library tsmc18_6lm
```

SEE ALSO

```
set_lib_cell_spacing_label(2)
set_spacing_label_rule(2)
report_spacing_rules(2)
```

remove_annotated_check

Removes annotated timing check information.

SYNTAX

```
int remove_annotated_check
-all | -from from_list | -to to_list
[-rise | -fall]
[-clock rise | fall]
[-setup] [-hold]
[-recovery] [-removal]
[-nochange_low] [-nochange_high]
```

Data Types

<i>from_list</i>	list
<i>to_list</i>	list

ARGUMENTS

-all

Specifies to remove all annotated checks in the current design. This includes rise and fall values for setup, hold, recovery, removal, and nochange pin-to-pin timing checks. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments or options.

-from *from_list*

Specifies a list of leaf cell clock pins that are the startpoints of the timing arcs from which annotated checks are to be removed. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments or options.

-to *to_list*

Specifies a list of leaf cell data pins that are the endpoints of the timing arcs from which annotated checks are to be removed. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments or options.

-rise | **-fall**

Specifies whether the check to be removed is for data rise or fall transition. If you don't specify either **-rise** or **-fall**, both values are removed.

-clock *rise* | *fall*

Specifies whether the check to remove is for clock rising or falling. By default, checks for both clock rise and fall are removed.

-setup

Indicates to remove only setup timing check information.

-hold

Indicates to remove only hold timing check information.

```
-recovery
    Indicates to remove only recovery timing check information.

-removal
    Indicates to remove only removal timing check information.

-nochange_low
    Indicates to remove only the nochange timing check against data low
    information.

-nochange_high
    Indicates to remove only the nochange timing check against data high
    information.
```

DESCRIPTION

Removes annotated timing checks between the specified pins. Data rise and fall and clock rise and fall annotated checks are removed by default.

You can use the **remove_annotated_check** command for pins at lower levels of the design hierarchy. These pins are specified as "INSTANCE1/INSTANCE2/PIN_NAME."

If the design is not already linked, **remove_annotated_check** links it automatically.

The **remove_annotated_check** command removes annotated timing checks set by **set_annotated_check**, and also removes setup, hold, recovery, removal, or nochange annotated timing checks set by **read_sdf**. The **reset_design** command removes annotated timing checks in addition to other information.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example removes an annotated setup check between pins "u1/u2/CP" and "u1/u2/D".

```
prompt> remove_annotated_check -setup -from u1/u2/CP -to u1/u2/D
```

The following example removes all annotated timing checks on the current design.

```
prompt> remove_annotated_check -all
```

SEE ALSO

```
current_design(2)
link(2)
read_sdf(2)
report_annotated_check(2)
reset_design(2)
set_annotated_check(2)
```

remove_annotated_check

remove_annotated_delay

Removes the annotated delay between two pins.

SYNTAX

```
int remove_annotated_delay
-all
| -cell_all
| -net_all
| -non_clock_cell_all
| -non_clock_net_all
| -from from_list
| -to to_list
```

Data Types

<i>from_list</i>	list
<i>to_list</i>	list

ARGUMENTS

-all
Specifies to remove all net and cell annotated delays in the current design. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments.

-cell_all
Specifies to remove all cell annotated delays in the current design.

-net_all
Specifies to remove all net annotated delays in the current design. The user can specify **-cell_all** and **-net_all** together to remove all cell and net annotated delays.

-non_clock_cell_all
Specifies to remove all cell annotated delays in the current design except those on the clock network.

-non_clock_net_all
Specifies to remove all net annotated delays in the current design except those on the clock network. The user can specify **-non_clock_cell_all** and **-non_clock_net_all** together to remove all cell and net annotated delays not on the clock network.

-from *from_list*
Specifies a list of leaf cell pins or top-level ports that are the startpoints of the timing arcs from which to remove annotated delays. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments.

-to *to_list*
Specifies a list of leaf cell pins or top-level ports that are the endpoints

of the timing arcs from which to remove annotated delays. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments.

DESCRIPTION

Removes annotated delays between the specified pins, which must be on the same net or on the same cell. Both rise and fall annotated delays are removed. There must be a timing arc between the pins in *from_list* and the pins in *to_list* or no annotated delay is removed.

You can use **remove_annotated_delay** for pins at lower levels of the design hierarchy. These pins are specified as "INSTANCE1/INSTANCE2/PIN_NAME."

If the current design is hierarchical, you must link the design with **link -all** before using **remove_annotated_delay**.

To annotate net delay values between pins in a design, use **set_annotated_delay -net**. To annotate cell delay values between pins in a design, use **set_annotated_delay -cell**. You must use **-from** and **-to** in the same manner you used them to set annotated values. For example, use **remove_annotated_delay -from** to remove an annotated delay set with **set_annotated_delay -from**. To remove an annotated delay set with **set_annotated_delay -to**, use **remove_annotated_delay -to**. To remove an annotated delay set with **set_annotated_delay -from -to**, use **remove_annotated_delay -from -to**.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example removes an annotated net delay between output pin "Z" of cell instance "U1/U2/U3" and input pin "A" of cell instance "U6". The delay to remove was annotated with the **set_annotated_delay -net <value> -from U1/U2/U3/Z -to U6/A**.

```
prompt> remove_annotated_delay -from U1/U2/U3/Z -to U6/A
```

The following example removes the annotated lumped net delay between output pin "Z" of cell instance "U1/U2/U3" and all fanout pins on that net. The delay to be removed was annotated with "set_annotated_delay -net <value> -from U1/U2/U3/Z".

```
prompt> remove_annotated_delay -from U1/U2/U3/Z
```

The following example removes all annotated net and cell delays from the current design.

```
prompt> remove_annotated_delay -all
```

SEE ALSO

`link(2)`

`remove_annotated_delay`

```
report_timing(2)
reset_design(2)
set_annotated_delay(2)
```

remove_annotated_transition

Removes the annotated transition at a pin.

SYNTAX

```
int remove_annotated_transition
-all
```

ARGUMENTS

-all

Specifies to remove annotated transition time from every pin in the current design. You must specify either **-all** or **-at**; if you specify **-all**, you cannot specify any other arguments.

DESCRIPTION

Removes annotated transitions at specified pins. Both rise and fall annotated transitions will be removed.

To annotate net transition values at pins in a design, use **set_annotated_transition**.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example removes the annotated transition at every pin in the design.

```
prompt> remove_annotated_transition -all
```

The following example removes the annotated transition at the output pin "Z" of cell instance "U1/U2/U3". The transition to be removed was annotated with "set_annotated_transition value U1/U2/U3/Z".

```
prompt> remove_annotated_transition -at U1/U2/U3/Z
```

SEE ALSO

```
current_design(2)
link(2)
report_timing(2)
reset_design(2)
set_annotated_transition(2)
```

remove_annotations

Removes all annotated information on the design.

SYNTAX

```
status remove_annotations
```

ARGUMENTS

The fbremove_annotations command has no arguments.

DESCRIPTION

The **remove_annotations** command removes all annotations on the design, including delay, transition, resistance, capacitance, and check. These include the data set by the **set_annotated_check**, **set_annotated_delay**, **set_annotated_transition**, **set_resistance**, and **set_load** commands.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example removes all annotated information set by previous commands:

```
prompt> set_annotated_check 0.25 -from m2/st_reg[0]/CP -to m2/st_reg[0]/D -setup
Warning: There is no 'setup_falling' timing arc between pins
        'm2/st_reg[0]/CP' and 'm2/st_reg[0]/D'. (OPT-815)
1

prompt> set_annotated_delay -cell 0.03 -from m1/U18/A -to m1/U18/Z
Information: Annotated 'cell' delays are assumed to include load delay. (UID-282)
1

prompt> set_annotated_transition 0.07 m2/st_reg[0]/D
1

prompt> remove_annotations
1
```

1364

remove_antenna_rules

Deletes all of the antenna rules stored in the library.

SYNTAX

```
status_value remove_antenna_rules  
[mw_lib]
```

Data Types

mw_lib list

ARGUMENTS

mw_lib

Specifies the Milkyway library to be updated. The value of *mw_lib* can be a library name or a one-element collection of a library. The *mw_lib* option is optional. The default is to use the current Milkyway library.

DESCRIPTION

This command deletes all of the antenna rules stored in the library. The command returns a status indicating success or failure.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

```
prompt> remove_antenna_rules
```

SEE ALSO

```
define_antenna_rule(2)  
define_antenna_layer_ratio_scale(2)  
define_antenna_layer_rule(2)  
report_antenna_rules(2)
```

remove_attribute

Removes an attribute from the specified objects.

SYNTAX

```
collection remove_attribute
[-class class_name]
[-quiet]
object_list
attribute_name
```

Data Types

<i>class_name</i>	string
<i>object_list</i>	list
<i>attribute_name</i>	string

ARGUMENTS

-class *class_name*
Specifies the class name for the object specified in *object_list*, if the element of *object_list* is a name. Valid classes are design, port, cell, net, etc.

-quiet
Turns off the warning messages that would otherwise be issued if the attribute or objects are not found.

object_list
Specifies a list of objects from which the attribute is to be removed. Each element in the list is either a collection or a pattern that is combined with the *class_name* to find the objects.

attribute_name
Specifies the name of the attribute to be removed.

DESCRIPTION

This command removes the specified attribute from the specified objects. For a complete listing of attributes, refer to the **attributes** man page.

This command creates a collection of objects that have the specified attribute removed. A returned empty string indicates that no object has been removed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the first command defining a new attribute named "X" on the net. The second command sets the "X" attribute to 30 on all the nets in the current hierarchy. The third command removes the "X" attribute from the nets named VSS and VDD. The fourth command retrieves the "X" attribute from the net named VDD. The fifth command retrieves the "X" attribute from a net named in.

```
prompt> define_user_attribute -type int -class net X
Info:User-defined attribute 'X' on class 'net'.
1
prompt> set_attribute [get_nets * -all] X 30
{"out", "in", "VDD", "VSS"}
prompt> remove_attribute [get_nets V* -all] X
{"VDD", "VSS"}
prompt> get_attribute [get_nets VDD -all] X
ERROR : Failed to get attr(X)'s value.
prompt> get_attribute [get_nets in] X
30
```

SEE ALSO

```
collections(2)
define_user_attribute(2)
get_attribute(2)
list_attributes(2)
reset_design(2)
set_attribute(2)
```

remove_base_arrays

Removes base arrays from the current design.

SYNTAX

```
status_value remove_base_arrays
[-all | pattern]
```

Data Types

pattern string

ARGUMENTS

-all

Specifies to remove all base arrays from the current design. The **-all** option is mutually exclusive with *patterns*.

pattern

Specifies to remove the base arrays that match the specified *pattern*. The *patterns* value is mutually exclusive with the **-all** option.

DESCRIPTION

The **remove_base_arrays** command removes base arrays from the current design. Specify the **-all** option to remove all base array records from the current design. Specify a pattern of base arrays to remove only the base arrays that match the specified pattern.

The command returns a value of **1** if it succeeds, or **0** if the command fails.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all base arrays in the design:

```
prompt> remove_base_arrays -all
1
```

SEE ALSO

`create_base_array(2)`

remove_bounds

Removes bounds from the current design.

SYNTAX

```
int remove_bounds
[-verbose]
[-all]
[-name bound_name_list]
objects
```

Data Types

<i>bound_name_list</i>	list
<i>objects</i>	string

ARGUMENTS

-verbose
Specifies to print information about what are being deleting.

-all
Specifies to remove all bounds from the current design. This command removes only bounds that have been created by using the **create_bounds** command. Bounds created in an input PDEF file cannot be removed. By default, this option is off.

-name *bound_name_list*
Specifies to remove bounds with the given names. By default, this option is off.

objects
Specifies bound objects to be removed. You can use the *get_bounds* command to specify the objects.

DESCRIPTION

This command removes bounds constraints from the current design. If you specify the **-all** option, all bounds are be removed from the design, with the exception of those specified in an input PDEF file. If you give a list of bound names, the bounds with the specified names are removed. The ID is displayed every time a bound is created. You can use the **report_bounds** command to view the ID.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes bounds named *foo_0* and *foo_1*.

```
prompt> remove_bounds -name {foo_0 foo_1}
prompt> remove_bounds [get_bounds *]
```

SEE ALSO

```
create_bounds(2)
create_placement(2)
get_bounds(2)
report_bounds(2)
set_cell_location(2)
update_bounds(2)
```

remove_buffer

Removes the buffer cells at a specified driver pin or net on a mapped design.

SYNTAX

```
status remove_buffer
    -from start_point
    -net net_list
    [-to end_point_list]
    [-level integer]
    cell_list
```

Data Types

<i>start_point</i>	list
<i>net_list</i>	list
<i>end_point_list</i>	list
<i>integer</i>	integer
<i>cell_list</i>	list

ARGUMENTS

-from *start_point*

Specifies the starting pin or port of the fanout tree from which the buffer(s) or inverter pair(s) need to be removed. Only driver pins or driver ports can be specified for this option.

This option **-from** is mutually exclusive with **-net** and **cell_list** options.

-net *net_list*

Specifies the starting net of the fanout tree from which the buffer(s) or inverter pair(s) need to be removed. Only one net can be specified for this option and the driver pin of this net would be considered as the start for fanout traversal. i.e. all the load cells connected to the net is considered in buffer tree.

This option **-net** is mutually exclusive with **-from** and **cell_list** options.

-to *end_point_list*

Specifies the ending pin(s) or port(s) where to stop the fanout traversal. Only those buffer(s) or inverter pair(s) than are in the fanin path of **-to** and the fanout path of **-from** or **-net** will be removed.

This option **-to** is mutually exclusive with **-level** option.

-level *integer*

Specifies the number of levels of buffers or inverter pairs to remove. If you specify an *integer* value that is less than the number of buffers or inverters between those specified by the *start_point_list* and *end_point_list* arguments, clean up occurs only on the *integer* number of levels from the value of *end_point_list*. Valid **-level** values are from 1 to 1,000,000. By default, value 1 is used for this option.

This option **-level** is mutually exclusive with **-to** option.

```
cell_list
    Specifies the buffer or inverter cell(s) to remove. Each buffer is a cell
    name or a collection of netlist cells. When inverter cells are specified, it
    should be specified in pairs.
    This option cell_list is mutually exclusive with the -to and -from options.
```

DESCRIPTION

This command removes buffer cells when you specify a *cell_list* and the buffer tree at the specified pins, or net on a mapped design. When a driver pin or a net is given, the buffer tree is removed with this driver as the root. The buffer tree removal process starts at the source and removes all buffer and inverter cells in its transitive fanout until it finds nonbuffer cells or when the **-level** number of transitive fanouts is reached.

This command does not remove the buffer tree across the hierarchy.

This command can remove inverters only as pairs. You must specify both of the pairing inverters if you use the *cell_list* argument. The *end_point_list* specified in the **-to** option can contain only load pins of the second inverter in the inverter pair. An inverter pair is considered as one level when decrementing the **-level**.

This command accepts the final implementation of buffer tree removal, even if it negatively impacts the timing or Design Rule Checking (DRC) violations in the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes a buffer cell.

```
prompt> remove_buffer -from cell1/O
Disconnecting net 'net1' from pin 'cell2/I'.
Disconnecting net 'net2' from pin 'cell5/I'.
Disconnecting net 'net2' from pin 'cell2/O'.
Removing net 'net2' in design 'Top'.
Connecting net 'net1' to pin 'cell5/I'.
Removing cell 'cell2' in design 'Top'.
1
```

```
prompt> remove_buffer -net net1
Disconnecting net 'net1' from pin 'cell2/I'.
Disconnecting net 'net2' from pin 'cell5/I'.
Disconnecting net 'net2' from pin 'cell2/O'.
Removing net 'net2' in design 'Top'.
Connecting net 'net1' to pin 'cell5/I'.
Removing cell 'cell2' in design 'Top'.
1
```

```
prompt> remove_buffer cell2
Disconnecting net 'net1' from pin 'cell2/I'.
Disconnecting net 'net2' from pin 'cell15/I'.
Disconnecting net 'net2' from pin 'cell2/O'.
Removing net 'net2' in design 'Top'.
Connecting net 'net1' to pin 'cell15/I'.
Removing cell 'cell2' in design 'Top'.
1
```

SEE ALSO

report_cell(2)
report_constraint(2)
```

remove_buffer_tree

Removes the buffer tree at a given driver pin.

SYNTAX

```
int remove_buffer_tree
[-from pin_or_net_list]
[-verbose]
[-all]
```

Data Types

pin_or_net_list list

ARGUMENTS

-from *pin_or_net_list*
Specifies a list of driver pins or nets from which buffer trees are to be removed. This option is mutually exclusive with the **-all** option.

-verbose
Indicates that additional information is to be displayed during buffer removal.

-all
Removes all buffer trees from all nets. This option is mutually exclusive with the **-from** option. By default, this option is off.

DESCRIPTION

This command removes the buffer tree for each specified driver pin and for the driver pin of each specified net.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes a buffer tree driven by pin a/0.

```
prompt> remove_buffer_tree -from [get_pins a/0]
```

The following example forces all high fanout buffer trees in the design to be removed.

```
prompt> remove_buffer_tree -all
```

SEE ALSO

`create_buffer_tree(2)`
`legalize_placement(2)`
`report_buffer_tree(2)`
`report_buffer_tree_qor(2)`
`report_net_fanout(2)`

remove_bus

Removes a port bus or net bus.

SYNTAX

```
status remove_bus  
object_list
```

Data Types

object_list list

ARGUMENTS

object_list
Specifies a list of port or net buses to remove.

DESCRIPTION

Removes port or net buses from a design. If port and net buses have the same name, both port buses and net buses are removed. Individual members of buses remain. The bus can be from the current design or one of its subdesigns. To delete a bus on a subdesign, it has to be unique.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example removes the specified port buses.

```
prompt> remove_bus {AB AC}
```

The following example removes the specified net buses.

```
prompt> remove_bus {BC BD}
```

In the following example, all buses with names that end in "s" are removed. If port and net buses have the same name, both buses are removed.

```
prompt> remove_bus *s
```

In the following example, all buses with names that start with "s" in the instance U1/U2 are removed. U1/U2 is a unique instantiation of design bot.

```
prompt> remove_bus U1/U2/s*
```

SEE ALSO

`create_net(2)`
`remove_net(2)`

remove_case_analysis

Removes the case analysis value from the specified input ports or pins.

SYNTAX

```
string remove_case_analysis
port_or_pin_list | -all
```

Data Types

port_or_pin_list list

ARGUMENTS

port_or_pin_list

Specifies ports or pins from which to remove the case analysis value.

-all

Specifies to remove case analysis for all ports or pins in the design where the **set_case_analysis** command has previously been set.

DESCRIPTION

The **remove_case_analysis** command removes the case analysis value previously specified on ports or pins. Case analysis is specified using the **set_case_analysis** command. You must specify either **-all** or *port_or_pin_list*. The tool issues an error message if neither argument is specified.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example specifies that ports *in0* and *in2* are set to the constant logic value 0:

```
prompt> set_case_analysis 0 {in0 in2}
prompt> report_case_analysis

*****
Report : case_analysis
Design : middle
Version: 1997.01-development
Date   : Mon Jul 22 08:13:50 1996
*****

Pin name          Case analysis value
-----
```

in2	0
in0	0

The following example removes the case analysis entry on port in2.

```
prompt> remove_case_analysis {in2}
prompt> report_case_analysis

*****
Report : case_analysis
Design : middle
Version: 1997.01-development
Date   : Mon Jul 22 08:14:16 1996
*****
```

Pin name	Case analysis value
in0	0

SEE ALSO

`report_case_analysis(2)`
`set_case_analysis(2)`

remove_cell

Removes cells from the current design.

SYNTAX

```
status remove_cell
cell_list | -all
```

Data Types

cell_list list

ARGUMENTS

cell_list

A list of cells to be removed from the current design. Each cell name must exist in the current design. You must specify either *cell_list* or **-all**.

-all

Removes all cells in the current design.

DESCRIPTION

Removes cells or cell instances from the current design. Also removes pins owned by the specified cells. The design or library cell to which the cell refers is not removed. If a cell instance is used, the parent design has to be unique.

To create cells, use **create_cell**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

This example uses **remove_cell** in the current design.

```
prompt> get_cells "*"
{U1 U2 U3 U4 U5 U6 U7 U8}

prompt> remove_cell {U1 U2}
Removing cell 'U1' in design 'example'.
Removing cell 'U2' in design 'example'.

prompt> get_cells "*"
{U3 U4 U5 U6 U7 U8}
```

In the following example, all cells remaining in the current design are removed.

```
prompt> remove_cell -all
Removing cell 'U3' in design 'example'.
Removing cell 'U4' in design 'example'.
Removing cell 'U5' in design 'example'.
Removing cell 'U6' in design 'example'.
Removing cell 'U7' in design 'example'.
Removing cell 'U8' in design 'example'.

prompt> get_cells "*"
{}
```

In the following example, the cell instances U1/foo1 and U1/foo2 are removed. The design MID has to be unique.

```
prompt> remove_cell {U1/foo1 U1/foo2}
Removing cell 'U1/foo1' in design 'MID'.
Removing cell 'U1/foo2' in design 'MID'.
```

SEE ALSO

`create_cell(2)`
`current_design(2)`

remove_cell_degradation

Removes the **cell_degradation** attribute on specified ports or designs.

SYNTAX

```
int remove_cell_degradation  
object_list
```

Data Types

object_list list

ARGUMENTS

object_list
Specifies a list of names of input ports for removing the **cell_degradation** attribute.

DESCRIPTION

Removes the **cell_degradation** attribute on the specified ports or designs.

To get information about optimization and design rule constraints, use **report_constraint**. To set the **cell_degradation** attribute, use **set_cell_degradationfp**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the cell degradation value on the port named `input_1`:

```
prompt> remove_cell_degradation input_1
```

SEE ALSO

```
set_cell_degradation(2)  
all_inputs(2)  
all_outputs(2)  
characterize(2)  
remove_attribute(2)  
report_constraint(2)  
set_max_capacitance(2)
```

remove_cell_sites

Deletes the specified cell sites.

SYNTAX

```
status remove_cell_sites
-all | cell_sites
```

Data Types

cell_sites collection

ARGUMENTS

-all

Deletes all the cell sites in the current design. Mutually exclusive with the *cell_sites* argument.

cell_sites

Specifies the cell sites to be deleted. Mutually exclusive with the **-all** option.

DESCRIPTION

This command removes the specified cell sites.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all cell sites from the current design.

```
prompt> remove_cell_sites -all
1
```

SEE ALSO

`get_cell_sites(2)`

remove_cell_vt_type

removes voltage threshold type of a library cell or all cells of a library. Voltage threshold type is used for mixed voltage threshold filler cell insertion

SYNTAX

```
integer remove_cell_vt_type  
-library library_name | -lib_cell cell_name
```

Data Types

<i>library_name</i>	string
<i>cell_name</i>	string

ARGUMENTS

```
-library library_name | -lib_cell cell_name
```

Use -library to specify a library name or -lib_cell to specify a cell name.

DESCRIPTION

Use this command to remove vt type string of a library cell or cells of a library.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example will remove vt type setting from all cells of library RefLib1

```
prompt> remove_cell_vt_type -library "RefLib1" fp
```

SEE ALSO

```
insert_stdcell_filler(2)  
set_vt_filler_rule(2)  
set_cell_vt_type(2)  
report_cell_vt_type(2)
```

remove_checkpoint_designs

Remove checkpoint designs created preroute optimization commands

SYNTAX

```
int remove_checkpoint_designs  
[-command command]
```

Data Types

command string

ARGUMENTS

-command *command*

This option is either "place_opt" or "clock_opt" and causes the command to remove all checkpoint designs created by this command. By default, all checkpoint designs are removed.

DESCRIPTION

By enabling checkpointing using the set_checkpoint_strategy, optimization will save the design (snapshot) at periodic intervals during optimization. This allows the user to examine the intermediate results while optimization is still proceeding.

After all analysis has been performed, the user can use this command to remove the checkpoint designs created by optimization command so that the disk space is freed up. If the user has created designs that have names that clash with the checkpoint design names, these designs WILL NOT be removed. Only checkpoint designs created by optimization will be removed.

If a design is still being accessed, then this command will not remove the design.

EXAMPLES

```
prompt> remove_checkpoint_designs -command place_opt  
will remove all checkpoint designs created by the place_opt command.  
  
prompt> remove_checkpoint_designs  
will remove all checkpoint designs.
```

SEE ALSO

[place_opt\(2\)](#)
[clock_opt\(2\)](#)
[set_checkpoint_strategy\(2\)](#)

remove_clock

Removes clocks from the current design.

SYNTAX

```
int remove_clock  
clock_list | -all
```

Data Types

clock_list list

ARGUMENTS

clock_list | -all

Specifies which clocks to remove. If you specify **-all**, all clocks are removed. Otherwise, the clocks in *clock_list* are removed.

DESCRIPTION

Removes the specified clock objects from the current design. You must specify either *clock_list* or **-all**.

If a clock to be removed is the only member of a path group, that path group is also removed. For information about path groups, refer to the **group_path** man page.

To list all clock sources in the design, use **report_clock**.

Multicorner-Multimode Support

This command uses information from the current scenario only.

EXAMPLES

The following example removes clock "CLK1".

```
prompt> remove_clock CLK1
```

The following example removes all clocks from the current design.

```
prompt> remove_clock -all
```

SEE ALSO

`create_clock(2)`
`current_design(2)`
`group_path(2)`
`report_clock(2)`
`reset_design(2)`

`remove_clock`

1386

remove_clock_gates

Identifies and removes clock-gating cells according to the specified option.

SYNTAX

```
status remove_clock_gates
[-gated_registers gated_register_list]
[-min_bitwidth minsize_value]
[-gating_cells clock_gating_cells_list]
```

Data Types

<i>gated_register_list</i>	object_list
<i>minsize_value</i>	int
<i>clock_gating_cells_list</i>	object_list

ARGUMENTS

-gated_registers *gated_register_list*

Specifies that all registers listed in *gated_register_list* will be nongated.

-min_bitwidth *minsize_value*

Specifies that all registers with size smaller than the *minsize_value* will be nongated.
